Welcome Message from the the Scientific Committee Chair

Dear colleagues,

Distinguished guests,

It is with great pleasure and honor that I welcome you to the conference on 'Digital Media in Modern Educational Reality: Positions, Contrasts, Challenges, Perspectives'.

We are living in an era defined by rapid technological advancements, which decisively influence the way we teach, learn, and interact within the educational space. The integration of digital media and artificial intelligence into education is no longer a future prospect, but a present reality that calls upon us to reflect, position ourselves, and take action.

The title of our conference accurately captures the multi-layered nature of the discussion we are invited to pursue. There are positions that champion the limitless potential of technology, but also contrasts expressing justified concerns regarding the human-centered dimension of education. We face challenges related to equal access, digital literacy, critical thinking, and data protection, while simultaneously opening up encouraging perspectives for personalized learning, creativity, and innovation.

This conference aspires to serve as a forum for fruitful dialogue, where educators and researchers will share experiences, present research data, and exchange views with respect for diversity of thought and scientific evidence. We are not looking for easy answers; instead, we aim to cultivate critical thinking and develop practices that serve the public interest and our educational mission.

I would like to extend my heartfelt thanks to you for your participation and your commitment to the continuous improvement of educational practice. Your presence here demonstrates that the educational community remains active, reflective, and future-oriented.

I wish you every success in the proceedings of the conference and hope you have highly constructive exchanges."

Sincerely,

Prof. Apostolos Tsagkaris

International Hellenic University, Thessaloniki, Greece

Scientific Committee Chair

Χαιρετισμός του Προέδρου της Επιστημονικής Επιτροπής

Αγαπητές συνάδελφοι και αγαπητοί συνάδελφοι, Αξιότιμοι προσκεκλημένοι,

Με ιδιαίτερη χαρά και τιμή σας καλωσορίζω στο συνέδριο με θέμα «Ψηφιακά Μέσα στη Σύγχρονη Εκπαιδευτική Πραγματικότητα: Θέσεις, Αντιθέσεις, Προκλήσεις, Προοπτικές».

Βρισκόμαστε σε μια εποχή που χαρακτηρίζεται από ραγδαίες τεχνολογικές εξελίξεις, οι οποίες επηρεάζουν καθοριστικά τον τρόπο που διδάσκουμε, μαθαίνουμε και αλληλεπιδρούμε στον εκπαιδευτικό χώρο. Η ενσωμάτωση των ψηφιακών μέσων και της τεχνητής νοημοσύνης στην εκπαίδευση δεν αποτελεί πλέον μια μελλοντική προοπτική, αλλά μια παρούσα πραγματικότητα που μας καλεί να αναστοχαστούμε, να τοποθετηθούμε και να δράσουμε.

Ο τίτλος του συνεδρίου μας αποτυπώνει με ακρίβεια το πολυεπίπεδο χαρακτήρα της συζήτησης που καλούμαστε να διεξάγουμε. Υπάρχουν θέσεις που υποστηρίζουν τις απεριόριστες δυνατότητες της τεχνολογίας, αλλά και αντιθέσεις που εκφράζουν δικαιολογημένες ανησυχίες για την ανθρωποκεντρική διάσταση της εκπαίδευσης. Αντιμετωπίζουμε προκλήσεις που αφορούν την ισότιμη πρόσβαση, την ψηφιακή παιδεία, την κριτική σκέψη και την προστασία των δεδομένων, ενώ ταυτόχρονα ανοίγονται ενθαρρυντικές προοπτικές για εξατομικευμένη μάθηση, δημιουργικότητα και καινοτομία.

Το συνέδριο αυτό φιλοδοξεί να αποτελέσει χώρο γόνιμου διαλόγου, όπου εκπαιδευτικοί και ερευνητές θα μοιραστούν εμπειρίες, θα παρουσιάσουν ερευνητικά δεδομένα και θα ανταλλάξουν απόψεις με σεβασμό στην πολυφωνία και την επιστημονική τεκμηρίωση. Δεν αναζητούμε εύκολες απαντήσεις, αλλά στοχεύουμε στη διαμόρφωση κριτικής σκέψης και στην ανάπτυξη πρακτικών που θα υπηρετούν το δημόσιο συμφέρον και το εκπαιδευτικό μας έργο.

Σας ευχαριστώ θερμά για τη συμμετοχή σας και τη δέσμευσή σας στη συνεχή βελτίωση της εκπαιδευτικής πράξης. Η παρουσία σας εδώ αποδεικνύει ότι η εκπαιδευτική κοινότητα παραμένει ενεργή, στοχαστική και προσανατολισμένη στο μέλλον.

Σας εύχομαι καλή επιτυχία στις εργασίες του συνεδρίου και εποικοδομητικές ανταλλαγές απόψεων.

Με εκτίμηση,

Απόστολος Τσαγκάρης, Καθηγητής,

Διεθνές Πανεπιστήμιο της Ελλάδος, Θεσσαλονίκη, Ελλάδα

Πρόεδρος Επιστημονικής Επιτροπής

Message from the Organizing Committee Chair

The conference proceedings feature 154 peer-reviewed papers. The majority of these fall under Topic 10 (Good Practices for Utilizing Digital Technologies in Teaching Practices) and Topic 13 (Artificial Intelligence in Education). Significant interest was also shown in the following thematic areas: 1 (Research on the development, application, and use of modern technologies in modern schooling, education, and learning), 2 (Pedagogical integration of digital media in teaching practices), 3 (Utilization and evaluation of digital and technological media), 15 (Gamification in Education), 24 (Teaching with digital media), and 27 (Educational administration using digital technologies). Conversely, no papers were submitted for Topics 20, 21, and 22, which cover Second-Generation E-Learning (Learning 2.0), Mobile Learning (Mobile learning, BYOD), and Open Educational Resources, respectively.

The proceedings include abstracts for all accepted papers published in both English and Greek, featured in the respective sections titled “Conference Abstracts” and “Περιλήψεις Άρθρων”. Authors were given the option to choose the language for their full paper submission. Consequently, full papers written in English (71 papers) are presented in the section titled “Conference Full Papers”, while those written in Greek (83 papers) are included under “Πλήρεις Εργασίες Συνεδρίου”.

Each abstract and full-paper section (in both English and Greek) is subdivided into the 28 conference topics. Within these topics, papers are listed in alphabetical order based on the filename submitted for review. The proceedings conclude with a detailed table of contents listing the titles of all papers.

Kinds Regards,

Dr. Fani Biskanaki

Director of Secondary Education Administration of Preveza, Greece

Organizing Committee Chair

Μήνυμα της Προέδρου της Οργανωτικής Επιτροπής

Στα πρακτικά του συνεδρίου παρουσιάζονται 154 εργασίες που αξιολογήθηκαν από κριτές. Οι περισσότερες από αυτές εντάσσονται στο Θεματικό Πεδίο 10 (Καλές πρακτικές αξιοποίησης ψηφιακών τεχνολογιών στη διδακτική πράξη) και στο Θεματικό Πεδίο 13 (Αξιοποίηση της Τεχνητής Νοημοσύνης στην Εκπαίδευση). Σημαντικό ενδιαφέρον εκδηλώθηκε επίσης για τα εξής θεματικά πεδία: 1 (Έρευνα για την ανάπτυξη, εφαρμογή και χρήση σύγχρονων τεχνολογιών στο σχολείο, την εκπαίδευση και τη μάθηση), 2 (Παιδαγωγική ενσωμάτωση των ψηφιακών μέσων στη διδακτική πράξη), 3 (Αξιοποίηση και αξιολόγηση των ψηφιακών και τεχνολογικών μέσων), 15 (Παιχνιδοποίηση / Gamification στην Εκπαίδευση), 24 (Διδασκαλία με ψηφιακή μέσα) και 27 (Διοίκηση της εκπαίδευσης με χρήση ψηφιακών τεχνολογιών). Αντίθετα, για τα Θεματικά Πεδία 20, 21 και 22 —που αφορούν στην Ηλεκτρονική Μάθηση Δεύτερης Γενιάς (Learning 2.0), την Κινητή Μάθηση (Mobile learning, BYOD) και τους ανοικτούς εκπαιδευτικούς πόρους αντίστοιχα— δεν υποβλήθηκε καμία εργασία.

Στα πρακτικά περιλαμβάνονται οι περιλήψεις όλων των εργασιών που αξιολογήθηκαν και εγκρίθηκαν προς δημοσίευση, τόσο στην αγγλική όσο και στην ελληνική γλώσσα, στις αντίστοιχες ενότητες με τους τίτλους “Conference Abstracts” και «Περιλήψεις Άρθρων». Στους συγγραφείς δόθηκε η δυνατότητα να επιλέξουν τη γλώσσα συγγραφής του πλήρους κειμένου τους. Έτσι, οι πλήρεις εργασίες που συντάχθηκαν στην αγγλική (71 εργασίες) παρουσιάζονται στην ενότητα “Conference Full Papers”, ενώ εκείνες που γράφτηκαν στην ελληνική (83 εργασίες) περιλαμβάνονται στην ενότητα «Πλήρεις Εργασίες Συνεδρίου».

Κάθε ενότητα περιλήψεων και πλήρων εργασιών (σε ελληνικά και αγγλικά) χωρίζεται στα 28 Θεματικά Πεδία του Συνεδρίου. Εντός αυτών, τα κείμενα παρουσιάζονται με αλφαβητική σειρά, με βάση το όνομα του αρχείου που υποβλήθηκε προς κρίση. Τα πρακτικά ολοκληρώνονται με έναν αναλυτικό πίνακα περιεχομένων που περιλαμβάνει τους τίτλους όλων των άρθρων.

Με εκτίμηση,

Δρ. Φανή Μπισκανάκη

Διευθύντρια της Διεύθυνσης Δευτεροβάθμιας Εκπαίδευσης Πρέβεζας

Πρόεδρος Οργανωτικής Επιτροπής

Conference Scope

The Secondary Education Administration of Preveza, the International Hellenic University, the Regional Primary & Secondary Education Administration of Epirus, the Ionian University, the Preveza Regional Unit of the Region of Epirus, the Municipality of Ziros, the Municipality of Parga, the Municipality of Preveza, and the Chamber of Commerce of Preveza—acting as supporting bodies of the Secondary Education Administration of Preveza —undertook the active support of this scientific initiative. The initiative aims at the enhancement of education, the promotion of research, and the dissemination of scientific knowledge within the educational community, as well as the local and wider society, through the presentation of contemporary scientific perspectives and pedagogical trends.

The 1st International Scientific Conference entitled *"Digital Media in Contemporary Educational Reality: Views, Counterviews, Challenges, and Perspectives"* aspires to serve as a forum for fruitful academic dialogue on the dynamic relationship between digital media, pedagogy, and education.

The organizing bodies of the Conference aim to: (a) forefront international discussions concerning the interactive relationship between emerging technological developments and instructional design; (b) encourage researchers to explore and examine the multiple dimensions of the field; (c) contribute to the educational process by advancing theoretical and methodological tools, as well as applied knowledge, for the integration of digital media into teaching and learning; (d) highlight innovative educational designs that make use of digital media in school education and in adult education, both formal and informal; and (e) create favorable conditions for scholarly reflection and the reconsideration of the role of digital media in contemporary educational practice.

Σκοπός Συνεδρίου

Η Διεύθυνση Δευτεροβάθμιας Εκπαίδευσης Πρέβεζας, το Διεθνές Πανεπιστήμιο της Ελλάδας, η Περιφερειακή Διεύθυνση Πρωτοβάθμιας και Δευτεροβάθμιας Εκπαίδευσης Ηπείρου, το Ιόνιο Πανεπιστήμιο, η Περιφερειακή Ενότητα Πρέβεζας της Περιφέρειας Ηπείρου, ο Δήμος Ζηρού, ο Δήμος Πάργας, ο Δήμος Πρέβεζας και το Επιμελητήριο Πρέβεζας, αρωγοί στο έργο της Διεύθυνσης Δευτεροβάθμιας Εκπαίδευσης Πρέβεζας ανέλαβαν την ενεργή υποστήριξη του επιστημονικού εγχειρήματος, που επιδιώκει την αναβάθμιση της εκπαίδευσης, την έρευνα και τη διάχυση της επιστημονικής γνώσης στην εκπαιδευτική κοινότητα, στην τοπική και ευρύτερη κοινωνία, με την παρουσίαση σύγχρονων επιστημονικών θέσεων και παιδαγωγικών τάσεων .

Το 1ο Διεθνές Επιστημονικό Συνέδριο "Ψηφιακά Μέσα στη Σύγχρονη Εκπαιδευτική Πραγματικότητα. Θέσεις, Αντιθέσεις, Προκλήσεις και Προοπτικές" φιλοδοξεί να αποτελέσει ένα πεδίο γόνιμου ακαδημαϊκού διαλόγου για τη δυναμική σχέση ψηφιακών μέσων, παιδαγωγικής και εκπαίδευσης.

Οι οργανωτικοί φορείς του Συνεδρίου επιδιώκουν: α) να φέρουν στο προσκήνιο τις συζητήσεις που διεξάγονται διεθνώς αναφορικά με την αλληλεπιδραστική σχέση των νέων τεχνολογικών επιτευγμάτων και του διδακτικού σχεδιασμού, β) να ενθαρρύνουν τους ερευνητές και τις ερευνήτριες να διερευνήσουν και να εξετάσουν τις ποικίλες διαστάσεις του πεδίου, γ) να συνεισφέρουν στην εκπαιδευτική διαδικασία, στα θεωρητικά - μεθοδολογικά εργαλεία και στην εφαρμοσμένη γνώση για την ένταξη των ψηφιακών μέσων στη διδακτική, δ) να αναδείξουν καινοτόμους εκπαιδευτικούς σχεδιασμούς με την αξιοποίηση ψηφιακών μέσων στη σχολική εκπαίδευση και στην εκπαίδευση ενηλίκων, τυπική και άτυπη και ε) να δημιουργήσουν ευνοϊκές συνθήκες για επιστημονικούς προβληματισμούς και επαναπροσδιορισμούς σε σχέση με το ρόλο των ψηφιακών μέσων στην εκπαιδευτική πραγματικότητα.

Thematic Areas (TA)

1. Research on the development, implementation, and use of contemporary technologies in the modern school, education, and learning.
2. The pedagogical integration of digital media into teaching practice (Learning Theories, Curricula, and Digital Media).
3. Utilization and evaluation of digital and technological media.
4. The digital divide and emerging inequalities.
5. Digital and visual literacy.
6. Digital ethics.
7. Digital citizenship.
8. Inclusive digital education.
9. The sustainable digital school.
10. Best practices in the pedagogical use of digital technologies.
11. Dynamic learning environments and digital educational tools.
12. The Internet of Things and education.
13. The use of Artificial Intelligence in education.
14. Pedagogical applications of educational robotics.
15. Gamification in education.
16. Virtual, augmented, and mixed reality in education.
17. Online educational environments for enhancing blended and distance learning.
18. Social networks and education.
19. Online learning communities.
20. Second-generation e-learning (Learning 2.0).
21. Mobile learning (Mobile Learning, BYOD).
22. Open educational resources.
23. Free and open-source software for education.
24. Teaching and digital media.
25. Digital storytelling in teaching practice.
26. Educational assessment using digital media and tools.
27. Educational administration and digital technologies.
28. Teachers' professional development through the use of new technologies.

Θεματικά Πεδία (ΘΠ)

1. Έρευνα για την ανάπτυξη, εφαρμογή και χρήση σύγχρονων τεχνολογιών στο σύγχρονο σχολείο, στην εκπαίδευση και τη μάθηση.
2. Η παιδαγωγική ενσωμάτωση των Ψηφιακών Μέσων στη διδακτική πράξη (Θεωρίες Μάθησης, Προγράμματα Σπουδών και Ψηφιακά Μέσα)
3. Αξιοποίηση και Αξιολόγηση των Ψηφιακών και Τεχνολογικών Μέσων
4. Ψηφιακό χάσμα και νέες ανισότητες
5. Ψηφιακός-Οπτικός Γραμματισμός
6. Ψηφιακή Ηθική
7. Ψηφιακή πολιτειότητα (Digital Citizenship)
8. Συμπεριληπτική ψηφιακή εκπαίδευση
9. Αειφόρο ψηφιακό σχολείο
10. Καλές πρακτικές αξιοποίησης ψηφιακών τεχνολογιών στη διδακτική πράξη
11. Δυναμικά περιβάλλοντα μάθησης και Ψηφιακά Εκπαιδευτικά Εργαλεία
12. Διαδίκτυο των πραγμάτων και εκπαίδευση
13. Αξιοποίηση της Τεχνητής Νοημοσύνης στην Εκπαίδευση
14. Διδακτική Αξιοποίηση της Εκπαιδευτικής Ρομποτικής
15. Παιχνιδοποίηση (Gamification) στην Εκπαίδευση
16. Εικονική, Επαυξημένη και Μικτή Πραγματικότητα στην Εκπαίδευση
17. Διαδικτυακά εκπαιδευτικά περιβάλλοντα για την ενίσχυση της μικτής και της εξ αποστάσεως εκπαίδευσης
18. Κοινωνικά δίκτυα και εκπαίδευση
19. Διαδικτυακές Κοινότητες Μάθησης
20. Ηλεκτρονική Μάθηση Δεύτερης Γενιάς (Learning 2.0)
21. Κινητή Μάθηση (Mobile learning, BYOD)
22. Ανοικτοί εκπαιδευτικοί πόροι
23. Ελεύθερος και ανοικτός κώδικας λογισμικού για την εκπαίδευση
24. Διδασκαλία και ψηφιακά μέσα
25. Η ψηφιακή αφήγηση στη διδακτική πράξη
26. Εκπαιδευτική αξιολόγηση με τη χρήση ψηφιακών μέσων και εργαλείων
27. Διοίκηση Εκπαίδευσης και ψηφιακές τεχνολογίες
28. Επαγγελματική ανάπτυξη εκπαιδευτικών με την αξιοποίηση νέων τεχνολογιών

Conference Scientific Committee

- Tsagkaris Apostolos, Professor, International Hellenic University (Chair)
- Paraskevas Michalis, Professor, University of Peloponnese; Vice-Chair of the Board, Computer Technology Institute and Press "Diophantus"; Head of the National Support Service for eTwinning Greece; Coordinator of the Greek School Network
- Tzionas Panagiotis, Professor, International Hellenic University
- Xanthos Stelios, Professor, International Hellenic University
- Korlos Apostolos, Professor, International Hellenic University
- Chatzigeorgiou Chrysoula, Professor, International Hellenic University
- Pange Polyxeni, Professor, University of Ioannina
- Soulis Spyridon-Georgios, Professor, University of Ioannina
- Plakitsi Aikaterini, Professor, University of Ioannina
- Mikropoulos Anastasios, Professor, University of Ioannina
- Kalles Dimitrios, Professor, Hellenic Open University
- Kyratsis Panagiotis, Professor, University of Western Macedonia
- Papastergiou Thomas, Associate Professor, Sorbonne Paris Nord University, Laboratoire d'Informatique de Paris Nord (LIPN)
- Longo Francesco, Associate Professor, University of Calabria, Italy
- Asimakopoulos Konstantinos, Associate Professor, International Hellenic University
- Exarchos Themistoklis, Associate Professor, Ionian University
- Simeli Ioanna, Assistant Professor, International Hellenic University
- Tsongas Konstantinos, Assistant Professor, International Hellenic University
- Efkolidis Nikolaos, Assistant Professor, University of Western Macedonia
- Papadopoulou Souzana, Assistant Professor, International Hellenic University
- Pangalos Ioannis, Assistant Professor, International Hellenic University
- Kitsantas Thomas, Lecturer, University of Ioannina
- Papadimitriou Sofia, PhD, Head of Educational Radio, Television and Digital Media, Ministry of Education, Religious Affairs and Sports; Tutor-Counsellor, Hellenic Open University
- Tzotzis Anastasios, PhD, University of Western Macedonia
- Manavis Athanasios, PhD, University of Western Macedonia

Επιστημονική Επιτροπή Συνέδριου

- Τσαγκάρης Απόστολος, Καθηγητής, ΔΙΠΑΕ (Πρόεδρος)
- Παρασκευάς Μιχάλης, Καθηγητής, Πανεπιστήμιο Πελοποννήσου, Αντιπρόεδρος ΔΣ ΙΤΥΕ "Διόφαντος", Επικεφαλής ΕΟΥ eTwinning, Συντονιστής ΠΣΔ
- Τζιώνας Παναγιώτης, Καθηγητής, ΔΙΠΑΕ
- Ξανθός Στέλιος, Καθηγητής, ΔΙΠΑΕ
- Κορλός Απόστολος, Καθηγητής, ΔΙΠΑΕ
- Χατζηγεωργίου Χρυσούλα, Καθηγήτρια, ΔΙΠΑΕ
- Παγγέ Πολυξένη, Καθηγήτρια, Πανεπιστήμιο Ιωαννίνων
- Σούλης Σπυρίδων-Γεώργιος, Καθηγητής, Πανεπιστήμιο Ιωαννίνων
- Πλακίτση Αικατερίνη, Καθηγήτρια, Πανεπιστήμιιο Ιωαννίνων
- Μικρόπουλος Αναστάσιος, Καθηγητής, Πανεπιστήμιο Ιωαννίνων
- Καλλές Δημήτριος, Καθηγητής, ΕΑΠ
- Κυράτσης Παναγιώτης, Καθηγητής, Πανεπιστήμιο Δυτικής Μακεδονίας
- Παπαστεργίου Θωμάς, Αναπληρωτής Καθηγητής, Πανεπιστήμιο Sorbonne Paris Nord, LIPN
- Longo, Francesco, Associate Professor, University of Calabria, Italy
- Ασημακόπουλος Κωνσταντίνος, Αναπληρωτής Καθηγητής, ΔΙΠΑΕ
- Έξαρχος Θεμιστοκλής, Αναπληρωτής Καθηγητής, Ιόνιο Πανεπιστήμιο
- Σιμέλη Ιωάννα, Επίκουρη Καθηγήτρια, ΔΙΠΑΕ
- Τσογγάς Κωνσταντίνος, Επίκουρος Καθηγητής, ΔΙΠΑΕ
- Ευκολίδης Νικόλαος, Επίκουρος Καθηγητής, Πανεπιστήμιο Δυτικής Μακεδονίας
- Παπαδοπούλου Σουζάνα, Επίκουρη Καθηγήτρια, ΔΙΠΑΕ
- Πάγκαλος Ιωάννης, Επίκουρος Καθηγητής, ΔΙΠΑΕ
- Κιτσαντάς Θωμάς, Λέκτορας, Πανεπιστήμιο Ιωαννίνων
- Παπαδημητρίου Σοφία, Δρ., Προϊσταμένη Εκπαιδευτικής Ραδιοτηλεόρασης και Ψηφιακών Μέσων - ΥΠΑΙΘΑ, ΣΕΠ ΕΑΠ
- Τζώτζης Αναστάσιος, Δρ., Πανεπιστήμιο Δυτικής Μακεδονίας
- Μανάβης Αθανάσιος, Δρ., Πανεπιστήμιο Δυτικής Μακεδονίας

Conference Organising Committee

- Biskanaki Fani, PhD, Administrator of the Secondary Education Administration of Preveza (Chair)
- Besi Marina, PhD, Deputy Regional Director of Regional Primary & Secondary Education Administration of Epirus
- Sakellaropoulou Evdoxia, Regional Educational Quality Supervisor, Regional Primary & Secondary Education Administration of Epirus
- Vasileiou Kleopatra, PhD, Director of the Primary Education Administration of Arta
- Logotheti Stamatia, Director of the Secondary Education Administration of Ioannina
- Michalis Ilias, Director of the Primary Education Administration of Preveza
- Mitsionis Vasileios, Director of the Secondary Education Administration of Thesprotia
- Dimakopoulou Fotini, Educational Quality Supervisor, Secondary Education Administration of Preveza
- Passa Sofia, Education Consultant for Primary School Teachers, Primary Education Administration of Preveza
- Chasiotis Nikolaos, Education Consultant for Electronics, Secondary Education Administration of Ioannina; Pedagogical Supervisor of School Units, Secondary Education Administration of Preveza
- Ntoka Aglaia, Educational Quality Supervisor, Primary Education Administration of Arta
- Ntamani Aikaterini, Education Consultant for Preschool Teachers, Primary Education Administration of Arta

Οργανωτική Επιτροπή

- Μπισκανάκη Φανή, Δρ., Διευθύντρια της Δ.Δ.Ε Πρέβεζας (Πρόεδρος)
- Μπέση Μαρίνα, Δρ., Αναπληρώτρια Περιφερειακή Διευθύντρια ΠΔΕ Ηπείρου
- Σακελλαροπούλου Ευδοξία, Περιφερειακή Επόπτρια Ποιότητας της Εκπαίδευσης Π.Δ.Ε. Ηπείρου
- Βασιλείου Κλεοπάτρα, Δρ., Διευθύντρια της Δ.Π.Ε Άρτας
- Σταματία Λογοθέτη, Διευθύντρια της Δ.Δ.Ε. Ιωαννίνων
- Μιχαλης Ηλίας, Διευθυντής της Δ.Π.Ε. Πρέβεζας
- Μητσιώνης Βασίλειος, Διευθυντής της Δ.Δ.Ε. Θεσπρωτίας
- Δημακοπούλου Φωτεινή, Επόπτρια Ποιότητας της Εκπαίδευσης Δ.Δ.Ε. Πρέβεζας
- Πασσά Σοφία, Σύμβουλος Εκπαίδευσης Δασκάλων Δ.Π.Ε. Πρέβεζας
- Χασιώτης Νικόλαος, Σύμβουλος Εκπαίδευσης Ηλεκτρονικών Δ.Δ.Ε. Ιωαννίνων, Παιδαγωγικά Υπεύθυνος Σχολικών Μονάδων Δ.Δ.Ε. Πρέβεζας
- Ντόκα Αγλαΐα, Επόπτρια Ποιότητας της Εκπαίδευσης Δ.Π.Ε. Άρτας
- Νταμάνη Αικατερίνη, Σύμβουλος Εκπαίδευσης Νηπιαγωγών Δ.Π.Ε. Άρτας

INVITED SPEAKERS - ΠΡΟΣΚΕΛΗΜΕΝΟΙ ΟΜΙΛΗΤΕΣ

(In their order of appearance in the Conference Program –
Κατά τη σειρά αναγραφής τους στο Πρόγραμμα του Συνεδρίου)

Keynote Speaker:
Kitsantas Anastasia, PhD, Professor,
Program in Educational Psychology, Division of Educational Psychology and Research Methods, George Mason University, USA

Anastasia Kitsantas is Professor of Educational Psychology and a former Director of the Office of Doctoral Studies and the Division of the Educational Psychology, Research Methods and Education Policy in the College of Education and Human Development at George Mason University. Her research interests focus on the development of Self-Regulated Learning (SRL) and student motivation across various areas of human functioning. She has also studied the role of learning technologies in supporting student SRL. She is the editor, co-author, or author of four books and over 150 publications many of which are directed toward the training of self-regulation. She has received funding for her scholarship from various agencies. She is the former Editor-in-Chief of The Journal of Experimental Education and is serving on the Editorial Boards of several journals. She is the recipient of the 2019 Barry J. Zimmerman Award for Outstanding Contributions to the fields of studying and SRL research by the Studying and SRL Special Interest Group of the American Educational Research Association. She is also a Fellow of the American Psychological Association's: Division 15, Educational Psychology, the American Educational Research Association, and the Association for Psychological Science.

Speech Title:
"Leveraging Digital Technologies to Boost Learner Self-Regulation and Achievement"

This talk explores how digital technologies embedded in virtual platforms can be utilized to enhance self-regulated learning (SRL) and improve overall learning outcomes. Drawing on existing research, the presentation highlights the importance of using digital tools to model, emulate, provide guided practice, and scaffold learning experiences to foster critical thinking, deep engagement with the material, and the development of learner independence. Additionally, the talk emphasizes the significance of teaching prompt engineering, a crucial skill that enables students to craft effective inputs for AI models. It also underscores the role of SRL skills in facilitating productive interactions with AI. Key takeaways for both instructors and learners will be provided.

Κεντρική Ομιλήτρια:
Αναστασία Κιτσαντά, PhD, Καθηγήτρια,
Πρόγραμμα Εκπαιδευτικής Ψυχολογίας, Τομέας Εκπαιδευτικής Ψυχολογίας και Ερευνητικών Μεθόδων, Πανεπιστήμιο George Mason, ΗΠΑ

Η Αναστασία Κιτσαντά είναι Καθηγήτρια Εκπαιδευτικής Ψυχολογίας και πρώην Διευθύντρια του Γραφείου Διδακτορικών Σπουδών και του Τομέα Εκπαιδευτικής Ψυχολογίας, Ερευνητικών Μεθόδων και Εκπαιδευτικής Πολιτικής στο Κολλέγιο Εκπαίδευσης και Ανθρώπινης Ανάπτυξης του Πανεπιστημίου George Mason. Τα ερευνητικά της ενδιαφέροντα εστιάζουν στην ανάπτυξη της Αυτορρυθμιζόμενης Μάθησης (Self-Regulated Learning - SRL) και στα κίνητρα των μαθητών σε διάφορους τομείς της ανθρώπινης λειτουργίας. Έχει επίσης μελετήσει τον ρόλο των τεχνολογιών μάθησης στην υποστήριξη της αυτορρυθμιζόμενης μάθησης των μαθητών. Είναι επιμελήτρια, συν-συγγραφέας ή συγγραφέας τεσσάρων βιβλίων και περισσότερων από 150 δημοσιεύσεων, πολλές από τις οποίες κατευθύνονται προς την εκπαίδευση στην αυτορρύθμιση. Έχει λάβει χρηματοδότηση για το επιστημονικό της έργο από διάφορους φορείς. Είναι πρώην Αρχισυντάκτρια (Editor-in-Chief) του περιοδικού *«The Journal of Experimental Education»* και συμμετέχει στις Συντακτικές Επιτροπές

(Editorial Boards) αρκετών επιστημονικών περιοδικών. Είναι η αποδέκτρια του Βραβείου Barry J. Zimmerman 2019 για την Εξέχουσα Προσφορά στους τομείς της μελέτης και της έρευνας για την Αυτορρυθμιζόμενη Μάθηση (SRL) από την Ειδική Ομάδα Ενδιαφέροντος (SIG) για τη Μελέτη και την Αυτορρυθμιζόμενη Μάθηση του Αμερικανικού Οργανισμού Εκπαιδευτικής Έρευνας (AERA). Είναι επίσης Εταίρος (Fellow) της Αμερικανικής Ψυχολογικής Εταιρείας (APA: Τμήμα 15, Εκπαιδευτική Ψυχολογία), του Αμερικανικού Οργανισμού Εκπαιδευτικής Έρευνας (AERA) και της Ένωσης για την Ψυχολογική Επιστήμη (APS).

Θέμα Ομιλίας:
«Αξιοποίηση των Ψηφιακών Τεχνολογιών για την Ενίσχυση της Αυτορρύθμισης και της Επίδοσης των Μαθητών»

Αυτή η ομιλία εξετάζει πώς οι ψηφιακές τεχνολογίες που είναι ενσωματωμένες σε εικονικές πλατφόρμες μπορούν να χρησιμοποιηθούν για την ενίσχυση της αυτορρυθμιζόμενης μάθησης (SRL) και τη βελτίωση των συνολικών μαθησιακών αποτελεσμάτων. Βασιζόμενη στην υπάρχουσα έρευνα, η παρουσίαση αναδεικνύει τη σημασία της χρήσης ψηφιακών εργαλείων για τη μοντελοποίηση, την προσομοίωση, την παροχή καθοδηγούμενης πρακτικής και την πλαισίωση (scaffolding) των μαθησιακών εμπειριών, με σκοπό την καλλιέργεια της κριτικής σκέψης, τη βαθιά ενασχόληση με το υλικό και την ανάπτυξη της αυτονομίας του μαθητή. Επιπλέον, η ομιλία τονίζει τη σημασία της διδασκαλίας της μηχανικής εντολών (prompt engineering), μιας κρίσιμης δεξιότητας που επιτρέπει στους μαθητές να διαμορφώνουν αποτελεσματικά δεδομένα εισαγωγής (inputs) για μοντέλα Τεχνητής Νοημοσύνης (AI). Υπογραμμίζει επίσης τον ρόλο των δεξιοτήτων αυτορρυθμιζόμενης μάθησης (SRL) στη διευκόλυνση παραγωγικών αλληλεπιδράσεων με την Τεχνητή Νοημοσύνη. Στο τέλος, θα δοθούν βασικά πρακτικά συμπεράσματα (key takeaways) τόσο για τους εκπαιδευτικούς όσο και για τους μαθητές.

Invited Speaker:
Polyxeni Pagge, Professor
Department of Early Childhood Education, University of Ioannina, Former Dean of the School of Education, University of Ioannina, Greece

Polyxeni (Jenny) Pagge is a Professor in the Department of Early Childhood Education at the University of Ioannina. She is the former Dean of the School of Education and the Director of the Laboratory of New Technologies and Distance Education. Professor Pagge has developed significant scientific, research, and administrative work at the University of Ioannina, collaborating with numerous universities and research centers both in Greece and abroad. She actively participates in many associations and scientific societies, is a member of the Society for Epirus Studies (Εταιρεία Ηπειρωτικών Μελετών - E.H.M) in Ioannina, has served as President of the Board of Directors of the 'Klearchos Papadiamantis' Foundation in Konitsa, and has developed important initiatives within the Epirus Road Accident Prevention Society (EPTA) [Εταιρεία Πρόληψης Τροχαίων Ατυχημάτων Ηπείρου (ΕΠΤΑ)]. Additionally, she has collaborated with the Municipalities of Ioannina, Preveza, and Konitsa on issues related to education, technology, and innovation development.

Speech Title:

"ICT in Modern Education: Challenges and Prospects"

Προσκεκλημένη Ομιλήτρια:
Παγγέ Πολυξένη, Καθηγήτρια Παιδαγωγικού Τμήματος Νηπιαγωγών Πανεπιστημίου Ιωαννίνων, τ. Κοσμήτορας Σχολής Επιστημών Αγωγής Πανεπιστημίου Ιωαννίνων

Η Πολυξένη (Τζένη) Παγγέ είναι Καθηγήτρια του Παιδαγωγικού Τμήματος Νηπιαγωγών στο Πανεπιστήμιο Ιωαννίνων. Είναι τ. Κοσμήτορας της Σχολής Επιστημών Αγωγής καιΔιευθύντρια του Εργαστηρίου Νέων Τεχνολογιών και Εκπαίδευσης από Απόσταση. Η κ. Παγγέ έχει αναπτύξει σημαντικό επιστημονικό, ερευνητικό και διοικητικό έργο στο Πανεπιστήμιο Ιωαννίνων συνεργαζόμενη με πολλά άλλα πανεπιστήμια και ερευνητικά κέντρα στη χώρα μας και στο εξωτερικό. Συμμετέχει ενεργά σε πολλούς συλλόγους και επιστημονικές εταιρίες, είναι μέλος της Εταιρείας Ηπειρωτικών Μελετών Ιωαννίνων, υπήρξε πρόεδρος του ΔΣ του Ιδρύματος 'Κλέαρχος Παπαδιαμάντης' στην Κόνιτσα και έχει αναπτύξει σημαντικές δράσεις στην Εταιρεία Πρόληψης Τροχαίων Ατυχημάτων Ηπείρου (ΕΠΤΑ). Επιπλέον, συνεργάστηκε με τους Δήμους Ιωαννιτών, Πρέβεζας και Κόνιτσας σε θέματα εκπαίδευσης, τεχνολογίας και ανάπτυξης της καινοτομίας.

Θέμα Ομιλίας:

«Οι ΤΠΕ στην σύγχρονη εκπαίδευση: Προκλήσεις και προοπτικές»

Invited Speaker:
Dimitrios Kalles,
Professor School of Science and Technology, Hellenic Open University

Dimitris Kalles is a Professor at the Hellenic Open University, specializing in "Artificial Intelligence – Applications," and serves as the Director of both the Undergraduate Study Program in "Computer Science" and the Postgraduate Study Program in "Data Science and Machine Learning." He holds a Diploma in Computer Engineering and Informatics (1991) from the University of Patras and a Ph.D. (1995) from the University of Manchester Institute of Science and Technology (UK). His research interests lie in the Theory and Applications of Artificial Intelligence, with an emphasis on Machine Learning, as well as in Integrated Environments, Technologies, and Methodologies for Developing Educational Activities. He has worked as an engineer and researcher at the Computer Technology Institute, as Technical Director at Ahead Relationship Mediators S.A. (where he also served as a member of the Board of Directors), and as an evaluator for the European Commission and other organizations. He is a member of the Hellenic Artificial Intelligence Society, of which he has also served as President.

Speech Title:
"Artificial Intelligence: New Hopes and Old Fears"
The purpose of this talk is to highlight some key components and applications of Artificial Intelligence and, by looking back at its history, to raise questions regarding how much time will pass before we take it for granted.

Προσκεκλημένος Ομιλητής:
Καλλές Δημήτριος,
Καθηγητής Σχολής Θετικών Επιστημών και Τεχνολογίας, Ελληνικού Ανοιχτού Πανεπιστημίου

Ο Δημήτρης Καλλές είναι Καθηγητής στο Ελληνικό Ανοικτό Πανεπιστήμιο στο αντικείμενο «Τεχνητή Νοημοσύνη – Εφαρμογές» και Διευθυντής του Προπτυχιακού Προγράμματος Σπουδών «Πληροφορική» και του Μεταπτυχιακού Προγράμματος Σπουδών «Data Science and Machine Learning». Έχει Δίπλωμα Μηχανικών Ηλεκτρονικών Υπολογιστών και Πληροφορικής (1991) από το Πανεπιστήμιο Πατρών και Ph.D. (1995) από το University of Manchester Institute of Science and Technology (UK). Τα ερευνητικά του ενδιαφέροντα είναι σε Θεωρία και Εφαρμογές Τεχνητής Νοημοσύνης με έμφαση στη Μηχανική Μάθηση και σε Ολοκληρωμένα Περιβάλλοντα, Τεχνολογίες και Μεθοδολογίες Ανάπτυξης Εκπαιδευτικών Δραστηριοτήτων. Έχει εργαστεί ως μηχανικός και ερευνητής στο Ινστιτούτο Τεχνολογίας Υπολογιστών, ως Τεχνικός Διευθυντής στην εταιρία Ahead Relationship Mediators A.E., της οποίας διατέλεσε και μέλος του Δ.Σ, και ως αξιολογητής για την Ευρωπαϊκή Επιτροπή και για άλλους οργανισμούς. Είναι μέλος της Ελληνικής Εταιρίας Τεχνητής Νοημοσύνης, της οποίας έχει διατελέσει Πρόεδρος.

Θέμα Ομιλίας:

Τεχνητή Νοημοσύνη: νέες ελπίδες και παλιοί φόβοι
Σκοπός της ομιλίας είναι να αναδείξει μερικές βασικές συνιστώσες και εφαρμογές της Τεχνητής Νοημοσύνης καi ανατρέχοντας στην ιστορία της, να θέσει τον προβληματισμό σχετικά με το πόσο καιρός θα περάσει μέχρι να τη θεωρούμε δεδομένη.

Invited Speaker:
Thomas Papastergiou,
Associate Professor, Sorbonne Paris Nord University, LIPN, France

Thomas Papastergiou is an Associate Professor at University Sorbonne Paris Nord, in Villetaneuse, Île-de-France, France. His research interests are in Artificial Intelligence and Machine Learning domain, and more specifically on Explainability for AI models (XAI). The applications of his research cover a broad domain, mainly in medical, bio-medical and health domain, that range from cancer detection in medical imaging (CT, pathology images), frailty status assessment and prediction for elderly people, as well as in de novo drug discovery (in sicilo novel drug generation), using explicable AI generative models.

Speech Title:
«Large Language Models in Education: Techniques, Applications, Insights"»

In this brief talk, I will begin by reviewing the two fundamental architectures of Large Language Models (LLMs)—BERT-like and GPT-like—along with their training processes and the challenges associated with building LLM base models. I will also discuss the economic and environmental concerns surrounding their development. Next, I will explore how LLMs can be applied in education, highlighting both existing and potential applications from the perspectives of educators and students. The focus will be on two distinct educational applications of LLMs: (1) Enhancing teaching plans through simulated teacher-student interaction scenarios generated by LLMs. (2) Utilizing GPT-3-driven pedagogical agents to foster children's curiosity and question-asking skills. Finally, I will briefly share my personal experience with an LLM-based tool used in teaching graduate students in the USPN Computer Science master's program.

Προσκεκλημένος Ομιλητής:
Παπαστεργίου Θωμάς,
Αναπληρωτής Καθηγητής Πανεπιστήμιο Sorbonne Paris Nord, LIPN, Γαλλία

Ο Θωμάς Παπαστεργίου είναι Αναπληρωτής Καθηγητής στο Πανεπιστήμιο Sorbonne Paris Nord, στο Βιλτανέζ (Villetaneuse) της περιφέρειας Île-de-France στη Γαλλία. Τα ερευνητικά του ενδιαφέροντα εμπίπτουν στον τομέα της Τεχνητής Νοημοσύνης και της Μηχανικής Μάθησης, και πιο συγκεκριμένα στην Εξηγήσιμη Τεχνητή Νοημοσύνη (Explainable AI - XAI). Οι εφαρμογές της έρευνάς του καλύπτουν ένα ευρύ φάσμα, κυρίως στον ιατρικό, βιοϊατρικό τομέα και τον τομέα της υγείας, που εκτείνεται από την ανίχνευση καρκίνου σε ιατρική απεικόνιση (αξονικές τομογραφίες - CT, ιστοπαθολογικές εικόνες), την αξιολόγηση και πρόβλεψη της κατάστασης ευπάθειας σε ηλικιωμένους, έως και την εκ νέου ανακάλυψη φαρμάκων (in silico παραγωγή νέων φαρμάκων), με τη χρήση παραγωγικών μοντέλων εξηγήσιμης Τεχνητής Νοημοσύνης.

Θέμα Ομιλίας:
«Μεγάλα γλωσσικά μοντέλα στην εκπαίδευση: τεχνικές, εφαρμογές, εμπειρίες»

Σε αυτή τη σύντομη ομιλία, θα ξεκινήσω αναλύοντας τις δύο θεμελιώδεις αρχιτεκτονικές των Μεγάλων Γλωσσικών Μοντέλων (LLMs) —τύπου BERT και τύπου GPT— μαζί με τις διαδικασίες εκπαίδευσής τους και τις προκλήσεις που σχετίζονται με τη δημιουργία βασικών μοντέλων (base models) LLM. Θα συζητήσω επίσης τις οικονομικές και περιβαλλοντικές ανησυχίες που περιβάλλουν την ανάπτυξή τους. Στη συνέχεια, θα εξετάσω πώς τα LLMs μπορούν να εφαρμοστούν στην εκπαίδευση, αναδεικνύοντας τόσο τις υπάρχουσες όσο και τις πιθανές εφαρμογές από την πλευρά των εκπαιδευτικών και των μαθητών. Η έμφαση θα δοθεί σε δύο διακριτές εκπαιδευτικές εφαρμογές των LLMs: (1) Την ενίσχυση των διδακτικών πλάνων μέσω σεναρίων προσομοίωσης αλληλεπίδρασης δασκάλου-μαθητή που δημιουργούνται από LLMs. (2) Τη χρήση παιδαγωγικών πρακτόρων (pedagogical agents) βασισμένων στο GPT-3 για την καλλιέργεια της περιέργειας και των δεξιοτήτων διατύπωσης ερωτήσεων στα παιδιά. Τέλος, θα μοιραστώ εν συντομία την προσωπική μου εμπειρία από ένα εργαλείο βασισμένο σε LLM, το οποίο χρησιμοποιήθηκε στη διδασκαλία μεταπτυχιακών φοιτητών στο πρόγραμμα σπουδών Πληροφορικής (Master's) του USPN.

Invited Speaker:

Dr. Sofia T. Papadimitriou
Head of Educational Radiotelevision and Digital Media – Ministry of Education, Religious Affairs and Sports, Adjunct Faculty (SEPO) at the Hellenic Open University

Sofia T. Papadimitriou studied Mathematics, holds a Master's degree in Computer Science and Operational Research from the National and Kapodistrian University of Athens, and completed her PhD at the School of Humanities of the Hellenic Open University in the field of distance education in 2014, with a dissertation titled "The role of tutors and the development of a support mechanism in a Collaborative Learning environment in Distance Education." In 2020, she completed her postdoctoral research at the University of the Aegean on "Teachers' Digital Media Literacy in Online Learning Environments for School-based Distance Education." Since 2015, she has been the Head of the Department of Educational Radiotelevision and Digital Media at the Ministry of Education, Religious Affairs, and Sports. She teaches "Digital Media in Education and Communication" and supervises master's theses in the postgraduate program "Education and Technologies in Distance Teaching and Learning Systems – Educational Sciences" at the Hellenic Open University. She has participated in 70 National and International Conferences with papers in the fields of Open and Distance Education, Open Educational Resources (OER), and the integration of Digital and Audiovisual Media in Learning. She has co-authored book chapters in collective volumes published by IGI Global Books, Routledge Publishing, Ellinoekdotiki, and Gutenberg (http://eap.academia.edu/SofiaPapadimitriou)

Speech Title:

"Digital and Media Literacy: Empowering Citizens' Digital Skills"

Continuous technological advancements, particularly the shift from mass communication to online communication, fuel the transformation of teaching and learning processes. New literacies have emerged over the past 50 years, such as media literacy, information literacy, and Information and Communication Technologies (ICT) literacy, arising from the need for citizens to develop new skills in modern society. Digital literacy can be considered a broader term that encompasses these other literacies, emerging in the "Information Age" of a networked society.

This presentation focuses on the new literacies of the digital era, with an emphasis on Digital and Media Literacy, as well as the systematic efforts of European countries and organizations to address the required new knowledge and skills. Within the framework of these efforts, the European Framework for the Digital Competence of Educators (DigCompEdu) and the European Digital Competence Framework for Citizens (DigComp2.0) are presented. These frameworks provide a common language and approach that support dialogue and the exchange of best practices across borders.

Furthermore, European programs implementing the core axes of the DigCompEdu and DigComp2.0 frameworks and contributing to the transformation of education are showcased. These programs offer digital literacy opportunities to both young people and adult citizens, and particularly to educators, enabling them to expand their knowledge and acquire a broader range of skills in critical thinking, digital content creation, safety, communication management, and information handling in the digital world. Given that educators serve as role models for the next generation, equipping them with digital skills to become "digitally competent" is of vital importance.

Digital competences are essential in the social and personal aspects of our lives, whether related to work or leisure, in the public or private sector. The digital divide creates conditions of exclusion and leads to a democratic deficit, as it prevents equal access for all citizens. Improving citizenship is the primary goal of digital competence development. Consequently, digital literacies lie at the very core of modern democratic and digital citizenship.

Δρ Σοφία Θ. Παπαδημητρίου

Προϊσταμένη Εκπαιδευτικής Ραδιοτηλεόρασης και Ψηφιακών Μέσων – Υπουργείο Παιδείας Θρησκευμάτων και Αθλητισμού, Συνεργαζόμενο Εκπαιδευτικό Προσωπικό Ελληνικού Ανοιχτού Πανεπιστημίου

Η Σοφία Θ.Παπαδημητρίου σπούδασε στο Μαθηματικό τμήμα, έκανε μεταπτυχιακό στην Πληροφορική και Επιχειρησιακή Έρευνα του Εθνικού Καποδιστριακού Πανεπιστημίου Αθήνας και ολοκλήρωσε τη διδακτορική διατριβή της στη Σχολή Ανθρωπιστικών Σπουδών του Ελληνικού Ανοικτού Πανεπιστημίου στο πεδίο της εξ αποστάσεως εκπαίδευσης το 2014 με θέμα «Ο ρόλος των διδασκόντων και η ανάπτυξη μηχανισμού υποστήριξής τους σε περιβάλλον Συνεργατικής Μάθησης στην εξ Αποστάσεως Εκπαίδευση». Το 2020 ολοκλήρωσε τη μεταδιδακτορική της έρευνα στο Πανεπιστήμιο Αιγαίου με θέμα «Ψηφιακός Γραμματισμός Εκπαιδευτικών σε Οπτικοακουστικά Μέσα σε Διαδικτυακά Περιβάλλοντα Μάθησης για τη Σχολική εξ Αποστάσεως Εκπαίδευση». Από το 2015 είναι προϊσταμένη του Τμήματος Εκπαιδευτικής Ραδιοτηλεόρασης και Ψηφιακών Μέσων του Υπουργείου Παιδείας, Θρησκευμάτων και Αθλητισμού. Διδάσκει «Ψηφιακά Μέσα στην Εκπαίδευση και την Επικοινωνία» και επιβλέπει διπλωματικές εργασίες στο μεταπτυχιακό πρόγραμμα «Εκπαίδευση και Τεχνολογίες σε συστήματα εξ αποστάσεως διδασκαλίας και μάθησης – Επιστήμες της Αγωγής» του Ελληνικού Ανοικτού Πανεπιστημίου. Έχει συμμετοχή σε 70 Πανελλήνια και Διεθνή Συνέδρια με άρθρα στη θεματική της Ανοικτής και εξ Αποστάσεως Εκπαίδευσης, των Ανοικτών Εκπαιδευτικών Πόρων και της αξιοποίησης των Ψηφιακών και Οπτικοακουστικών Μέσων στη Μάθηση. Συμμετέχει στη συγγραφή κεφαλαίων σε συλλογικούς τόμους των εκδόσεων IGI Global Books, Routledge Publishing, Ελληνοεκδοτική και Gutenberg. (http://eap.academia.edu/SofiaPapadimitriou,)

Θέμα Ομιλίας:

«Ψηφιακός Γραμματισμός και Γραμματισμός στα Μέσα: Ενδυνάμωση των Ψηφιακών Δεξιοτήτων των Πολιτών»

Οι διαρκείς εξελίξεις της τεχνολογίας, ιδιαίτερα η μετάβαση από τη μαζική στη διαδικτυακή επικοινωνία τροφοδοτεί τον μετασχηματισμό των διαδικασιών διδασκαλίας και μάθησης. Νέοι γραμματισμοί έχουν αναδυθεί τα τελευταία 50 χρόνια όπως ο γραμματισμός στα Μέσα, ο πληροφοριακός γραμματισμός, ο γραμματισμός στις Τεχνολογίες Πληροφορίας και Επικοινωνίας (ΤΠΕ) ως αναγκαιότητα των νέων δεξιοτήτων που χρειάζεται να αναπτύξουν οι πολίτες στη σύγχρονη κοινωνία. Ο ψηφιακός γραμματισμός μπορεί να θεωρηθεί ένας γενικότερος όρος, ο οποίος εμπεριέχει τους υπόλοιπους γραμματισμούς, που αναδύονται στην «Εποχή της Πληροφορίας μιας Δικτυωμένης Κοινωνίας.

Η παρουσίαση εστιάζει στους νέους γραμματισμούς της ψηφιακής εποχής με έμφαση στον Ψηφιακό Γραμματισμό και τον Γραμματισμό στα Μέσα καθώς και στις μεθοδικές προσπάθειες των ευρωπαϊκών χωρών και οργανισμών να προσεγγίσουν τις νέες γνώσεις και δεξιότητες που απαιτούνται. Στο πλαίσιο των προσπαθειών αυτών παρουσιάζονται το Ευρωπαϊκό Πλαίσιο Ψηφιακών Δεξιοτήτων των Εκπαιδευτικών (DigCompEdu) και το Ευρωπαϊκό Πλαίσιο Ψηφιακών Δεξιοτήτων των Πολιτών (DigComp2.0), τα οποία παρέχουν μια κοινή γλώσσα και προσέγγιση που υποστηρίζει τον διάλογο και την ανταλλαγή βέλτιστων πρακτικών διασυνοριακά.

Στη συνέχεια παρουσιάζονται Ευρωπαϊκά προγράμματα που εφαρμόζουν τους άξονες των Ευρωπαϊκών Πλαισίων DigCompEdu και DigComp2.0 και συμβάλλουν στον μετασχηματισμό της εκπαίδευσης. Τα προγράμματα αυτά προσφέρουν ευκαιρίες Ψηφιακού Γραμματισμού τόσο σε νέους όσο και σε ενήλικες πολίτες και ιδιαιτέρως στους εκπαιδευτικούς, ώστε να επεκτείνουν τις γνώσεις τους και να κατακτήσουν ένα ευρύτερο φάσμα δεξιοτήτων κριτικής σκέψης, δημιουργίας ψηφιακού περιεχομένου, ασφάλειας, διαχείρισης της επικοινωνίας και πληροφορίας στον ψηφιακό κόσμο. Δεδομένου ότι οι εκπαιδευτικοί αποτελούν πρότυπα για την επόμενη γενιά, είναι ζωτικής σημασίας να οπλιστούν με ψηφιακές δεξιότητες ώστε να είναι «ψηφιακά επαρκείς».

Οι ψηφιακές ικανότητες είναι απαραίτητες στις κοινωνικές και προσωπικές πτυχές της ζωής μας, σχετίζονται με την εργασία ή τον ελεύθερο χρόνο, στον δημόσιο ή τον ιδιωτικό τομέα. Το ψηφιακό χάσμα δημιουργεί όρους αποκλεισμού, οδηγεί σε έλλειμμα δημοκρατίας, καθώς δεν επιτρέπει την ίση πρόσβαση στους πολίτες. Η βελτίωση της πολιτειότητας είναι ο πρωταρχικός στόχος της ανάπτυξης ψηφιακών ικανοτήτων. Συνεπώς, οι ψηφιακοί γραμματισμοί τοποθετούνται στον πυρήνα της σύγχρονης δημοκρατικής και ψηφιακής πολιτειότητας.

Invited Speaker:
Michalis Paraskevas, Professor
University of the Peloponnese, Vice President of CTI "Diophantus", Head of the National Support Organisation for eTwinning

Michalis Paraskevas is a Professor in the Department of Electrical and Computer Engineering at the University of the Peloponnese, specializing in signal processing systems, broadband networks, and telematics services. He is the Vice President of the Computer Technology Institute and Press "Diophantus" (CTI), coordinator of the Greek School Network, head of the eTwinning National Support Organisation (NSO) in Greece, manager of the stop-bullying.gov.gr platform, and coordinator of the NetLearn research group. He has 30 years of expertise in the design and operation of broadband networks, telecommunication systems, e-learning services, and e-government platforms. He directs research and development projects that have received national and international distinctions. He has published more than 100 scientific papers, authored 4 university textbooks, and participated in the organization of numerous conferences. He teaches in postgraduate programs at the Universities of Peloponnese and Thessaly and served as the inaugural Chair of the Department of Electrical and Computer Engineering at the University of the Peloponnese (2019-2021) (https://paraskevas.ece.uop.gr/)

Speech Title:
"eTwinning: Building a Strong Community of Innovative Teachers"
eTwinning is a flagship initiative of the European Commission. Throughout its twenty years of operation, it has shaped a dynamic community of teachers in Europe, promoting collaboration and innovation in school education. Through the secure European School Education Platform, teachers connect, exchange ideas, and implement collaborative projects, integrating new technologies and pedagogical approaches. With over 1,500,000 registered teachers, eTwinning serves as a hub for professional teacher development, offering training programs, webinars, and access to tools aimed at improving instruction.
The eTwinning National Support Organisation (NSO) provides educators with professional development through free webinars, workshops, and MOOCs, covering topics such as the pedagogical utilization of ICT, educational robotics, and Artificial Intelligence. Furthermore, it supports teachers in finding partners for international projects, provides technical and pedagogical assistance, and promotes best practices through awards and quality labels. Finally, it organizes conferences and special networking initiatives, reinforcing the momentum of the eTwinning community and the dissemination of innovation in education. The contribution of the eTwinning initiative is invaluable in shaping an educational culture of collaboration, enhancing teachers' skill development, and promoting interdisciplinary and digital learning.

Θέμα Ομιλίας:

«eTwinning: Κτίζοντας μια Ισχυρή Κοινότητα Καινοτόμων Εκπαιδευτικών»

Το eTwinning είναι μια εμβληματική δράση της Ευρωπαϊκής Επιτροπής. Στα είκοσι χρόνια λειτουργίας της έχει διαμορφώσει μια δυναμική κοινότητα εκπαιδευτικών στην Ευρώπη που προάγει τη συνεργασία και την καινοτομία στη σχολική εκπαίδευση. Μέσω της ασφαλούς πλατφόρμας European School Education Platform, οι εκπαιδευτικοί συνδέονται, ανταλλάσσουν ιδέες και υλοποιούν συνεργατικά έργα, ενσωματώνοντας νέες τεχνολογίες και παιδαγωγικές προσεγγίσεις. Με πάνω από 1.500.000 εγγεγραμμένους εκπαιδευτικούς, το eTwinning αποτελεί έναν πυρήνα επαγγελματικής ανάπτυξης των εκπαιδευτικών, προσφέροντας επιμορφωτικά προγράμματα, διαδικτυακά σεμινάρια και πρόσβαση σε εργαλεία για τη βελτίωση της διδασκαλίας. Ο Εθνικός Οργανισμός Υποστήριξης (ΕΟΥ) eTwinning παρέχει στους εκπαιδευτικούς επιμόρφωση μέσω δωρεάν διαδικτυακών σεμιναρίων, εργαστηρίων και MOOCs, καλύπτοντας θέματα όπως η παιδαγωγική αξιοποίηση των ΤΠΕ, η εκπαιδευτική ρομποτική και η Τεχνητή Νοημοσύνη. Επιπλέον, υποστηρίζει τους εκπαιδευτικούς στην αναζήτηση συνεργατών για διεθνή έργα, παρέχει τεχνική και παιδαγωγική βοήθεια και προωθεί τις καλές πρακτικές μέσω βραβεύσεων και ετικετών ποιότητας. Τέλος, οργανώνει συνέδρια και ειδικές δράσεις δικτύωσης, ενισχύοντας τη δυναμική της κοινότητας eTwinning και τη διάχυση της καινοτομίας στην εκπαίδευση. Η συμβολή της δράσης eTwinning είναι ανεκτίμητη στη διαμόρφωση μιας εκπαιδευτικής κουλτούρας συνεργασίας, ενισχύοντας την ανάπτυξη δεξιοτήτων των εκπαιδευτικών και προάγοντας τη διαθεματική και ψηφιακή μάθηση.

Invited Speaker:

Spyridon-Georgios Soulis, Professor

Department of Primary Education, Chair of the Department of Primary Education, University of Ioannina

Spyridon-Georgios Soulis studied in Greece and Germany, at the University of Cologne —as an IKY (State Scholarships Foundation) scholar— where he received his PhD in the field of Special Education. Currently, he serves as a Professor of Special Education in the Department of Primary Education at the University of Ioannina, where he has also been the Department Chair since 2020. He is the Director of the Laboratory of Special Education and Needs, as well as the Director of the Postgraduate Study Program "Special Education" within the same department. He has published monographs, articles, and research papers both in Greece and abroad, focusing on: a) Inclusive Education, b) Pedagogy and Didactics for individuals with disabilities and/or special educational needs, c) Teacher Education, d) Parent Education, and e) Individuals with high intellectual functioning.

Speech Title:

"Digital Technology in Education: Is the Teacher's Role Being Abolished?"

Teaching with the use of digital technology serves as a driving force for educational reform at the dawn of the second quarter of the 21st century. As a supportive tool and analytical aid in the classroom, digital technology enhances the effectiveness, precision, and variety of instructional approaches by leveraging intelligent platforms, appropriate tools, and applications. A crucial aspect of the educational process is understanding the relationship that develops between digital technology and the role of the educator, given the challenges and dilemmas emerging within this new learning environment.

This presentation examines the role of the teacher in the context of the increasing presence of digital technology in the educational process. More specifically, it attempts to address the question of whether digital technology can replace the physical presence of the teacher in the school classroom. At the same time, it highlights the redefinition of the teacher's role, which will render the educator's presence even more essential for a higher quality of life for citizens in a society that is constantly evolving and where past certainties are being questioned.

Σπυρίδων-Γεώργιος Σούλης,

Καθηγητής Παιδαγωγικού Τμήματος Δημοτικής Εκπαίδευσης (ΠΤΔΕ), Πρόεδρος ΠΤΔΕ, Πανεπιστημίου Ιωαννίνων

Ο Σπυρίδων-Γεώργιος Σούλης σπούδασε στην Ελλάδα και στη Γερμανία, στο Πανεπιστήμιο της Κολονίας - ως υπότροφος του ΙΚΥ, όπου έλαβε Διδακτορικό Τίτλο στον τομέα της Ειδικής Παιδαγωγικής. Σήμερα υπηρετεί ως Καθηγητής με γνωστικό αντικείμενο την Ειδική Αγωγή στο Παιδαγωγικό Τμήμα Δημοτικής Εκπαίδευσης του Πανεπιστημίου Ιωαννίνων, του οποίου είναι και Πρόεδρος από το 2020. Είναι Διευθυντής του Εργαστηρίου Ειδικής Αγωγής και Εκπαίδευσης και Διευθυντής του Προγράμματος Μεταπτυχιακών Σπουδών «Ειδική Αγωγή και Εκπαίδευση» του ίδιου Τμήματος. Έχει δημοσιεύσει μονογραφίες, άρθρα και έρευνες στην Ελλάδα και στο εξωτερικό που αναφέρονται: α) στην Παιδαγωγική της Συμπερίληψης, β) στην Παιδαγωγική και στη Διδακτική των ατόμων με αναπηρία ή και ειδικές εκπαιδευτικές ανάγκες, γ) στην εκπαίδευση των εκπαιδευτικών, δ) στην εκπαίδευση γονέων και ε) στα άτομα με υψηλή νοητική λειτουργικότητα.

Θέμα Ομιλίας:

«Ψηφιακή Τεχνολογία στην εκπαίδευση: Καταργείται ο ρόλος του εκπαιδευτικού;»

Η διδασκαλία με τη χρήση ψηφιακής τεχνολογίας αποτελεί κινητήρια δύναμη για τη μεταρρύθμιση της εκπαίδευσης στις απαρχές της δεύτερης εικοσιπενταετίας του 21ου αιώνα. Ως υποστηρικτικό εργαλείο και

αναλυτής στη σχολική τάξη, η ψηφιακή τεχνολογία ενισχύει την αποτελεσματικότητα, την ακρίβεια και την ποικιλία των διδακτικών προσεγγίσεων, αξιοποιώντας ευφυείς πλατφόρμες, κατάλληλα εργαλεία και εφαρμογές. Καθοριστική σημασία στην εκπαιδευτική διαδικασία κατέχει η κατανόηση της σχέσης που αναπτύσσεται μεταξύ της ψηφιακής τεχνολογίας και του ρόλου του εκπαιδευτικού εξαιτίας των προκλήσεων και των διλημμάτων που διαμορφώνονται στο νέο μαθησιακό περιβάλλον. Στην παρούσα εισήγηση εξετάζεται ο ρόλος του εκπαιδευτικού στο πλαίσιο της ολοένα και περισσότερο παρουσίας της ψηφιακής τεχνολογίας στην εκπαιδευτική διαδικασία. Ειδικότερα επιχειρείται να απαντηθεί το ερώτημα εάν η Ψηφιακή Τεχνολογία μπορεί να αντικαταστήσει τη φυσική παρουσία του εκπαιδευτικού στη σχολική τάξη. Παράλληλα καταγράφεται η επανανοηματοδότηση του ρόλου του εκπαιδευτικού, ο οποίος θα καταστήσει την παρουσία του εκπαιδευτικού περαιτέρω αναγκαία για μια ποιοτικότερη ζωή των πολιτών σε μια κοινωνία που διαρκώς θα εξελίσσεται και θα αμφισβητούνται βεβαιότητες των περασμένων χρόνων.

Invited Speaker:
Anastasios Mikropoulos, Professor
Department of Primary Education, University of Ioannina

Anastasios Mikropoulos holds a degree from the Department of Physics at the University of Ioannina. His doctoral research, conducted at the National Hellenic Research Foundation and the Universities of Manchester and Szeged, focused on non-linear optics and optical signal processing. Currently, he is a Professor at the University of Ioannina. His research interests include learning technologies in general and special education, with an emphasis on extended reality (XR) and educational neuroscience. He has published more than 240 internationally recognized papers and serves as a member of the editorial and review boards for various international scientific journals and conferences. He has taught at undergraduate and postgraduate levels in both Greek and international universities. Professor Mikropoulos is a founding member and elected president of the Hellenic Scientific Association of Information and Communication Technologies in Education (ETPE). In both 2022 and 2024, he was included in the top 2% of the most influential scientists worldwide.

Speech Title:
"Why and How Digital Technology in Teaching and Learning"

Effective pedagogical interaction aimed at learning requires social and socio-cognitive learning theories—namely, student-centered instructional models. It demands interactive learning technologies that enhance student engagement with both the teaching practice and the learning process. Digital technology provides opportunities to utilize multiple representations, offer experiences that accommodate multiple perspectives, embed learning within realistic and social contexts, encourage reflection, and develop metacognitive skills. These are essential prerequisites for constructing non-inert knowledge, which justifies the use of digital technology in the first place.
From a pedagogical standpoint, the method of utilization involves cognitive tools used by students to represent their knowledge, necessarily engaging them in high-level cognitive processes. From a technological perspective, the appropriate implementation of digital technology is selected for specific content. A key element is leveraging the unique characteristics of each technology for each given instructional situation. For example, learning management systems (LMS) or shared documents can be used for the remote collaborative application of brainstorming. For conducting experiments in natural sciences, mobile technologies are recommended, whereas virtual environments are proposed for studying ancient dwellings.

Προσκεκλημένος Ομιλητής:
Μικρόπουλος Αναστάσιος, Καθηγητής Παιδαγωγικού Τμήματος Δημοτικής Εκπαίδευσης,
Πανεπιστημίου Ιωαννίνων

Ο Αναστάσιος Μικρόπουλος είναι πτυχιούχος του Τμήματος Φυσικής του Πανεπιστημίου Ιωαννίνων. Η διδακτορική του έρευνα στο Εθνικό Ίδρυμα Ερευνών, στα Πανεπιστήμια Manchester και Szeged αφορούσε σε θέματα μη γραμμικής οπτικής και οπτικής επεξεργασίας σήματος. Σήμερα είναι καθηγητής στο Πανεπιστήμιο Ιωαννίνων. Στα ερευνητικά του ενδιαφέροντα περιλαμβάνονται οι τεχνολογίες μάθησης στη γενική και ειδική εκπαίδευση με έμφαση στην εκτεταμένη πραγματικότητα και η εκπαιδευτική νευροεπιστήμη. Έχει δημοσιεύσει περισσότερες από 240 εργασίες με διεθνή αναγνώριση. Είναι μέλος της συντακτικής και κριτικής επιτροπής διεθνών επιστημονικών περιοδικών και συνεδρίων. Έχει διδάξει σε προπτυχιακά και μεταπτυχιακά τμήματα σε ελληνικά Πανεπιστήμια και Πανεπιστήμια του εξωτερικού. Είναι ιδρυτικό μέλος και εκλεγμένος πρόεδρος της Ελληνικής Επιστημονικής Ένωσης Τεχνολογιών Πληροφορίας και Επικοινωνιών στην Εκπαίδευση-ΕΤΠΕ. Τα έτη 2022 και 2024 συγκαταλέχθηκε στο 2% των επιστημόνων με τη μεγαλύτερη επιρροή παγκοσμίως.

Θέμα Ομιλίας:

«Γιατί και πως ψηφιακή τεχνολογία στη διδασκαλία και τη μάθηση»

Η αποτελεσματική παιδαγωγική αλληλεπίδραση με σκοπό τη μάθηση απαιτεί κοινωνικές και κοινωνιογνωστικές θεωρίες μάθησης, δηλαδή μαθητοκεντρικά διδακτικά μοντέλα. Απαιτεί διαδραστικές τεχνολογίες μάθησης, που ενισχύουν την εμπλοκή του μαθητή με τη διδακτική πράξη και τη μαθησιακή διαδικασία. Η ψηφιακή τεχνολογία παρέχει δυνατότητες για χρήση πολλαπλών αναπαραστάσεων, παροχή εμπειριών με τη συνεκτίμηση πολλαπλών οπτικών, ενσωμάτωση της μάθησης σε ρεαλιστικά και κοινωνικά πλαίσια, ενθάρρυνση αναστοχασμού, ανάπτυξη μεταγνωστικών δεξιοτήτων. Αυτά είναι ζητούμενα για την οικοδόμηση μη αδρανούς γνώσης, και ο λόγος χρησιμοποίησης της ψηφιακής τεχνολογίας. Ο τρόπος αξιοποίησης της από παιδαγωγικής πλευράς είναι τα γνωστικά εργαλεία που χρησιμοποιούνται από τον/τη μαθητή/ρια για να αναπαραστήσει τη γνώση του/της εμπλέκοντας τον/την απαραίτητα σε νοητικές διεργασίες υψηλού επιπέδου. Από τεχνολογικής πλευράς, επιλέγεται η κατάλληλη υλοποίηση της ψηφιακής τεχνολογίας για ένα συγκεκριμένο περιεχόμενο. Σημαντικό στοιχείο αποτελεί η αξιοποίηση των μοναδικών χαρακτηριστικών κάθε τεχνολογίας για την εκάστοτε διδακτική κατάσταση. Για την εξ αποστάσεως συνεργατική εφαρμογή του καταιγισμού ιδεών για παράδειγμα, μπορούν να χρησιμοποιηθούν συστήματα διαχείρισης μάθησης ή κοινόχρηστα έγγραφα. Για τη διεξαγωγή πειραμάτων στις φυσικές επιστήμες προτείνονται οι φορητές τεχνολογίες, ενώ για τη μελέτη μιας αρχαίας κατοικίας εικονικά περιβάλλοντα.

Invited Speaker:
Dr. Spyridon Papadakis
Computer Science Education Counselor (PE86), Adjunct Faculty (SEPO) at the Hellenic Open University

Dr. Spyridon Papadakis is a Computer Science Education Counselor (PE86), with areas of scientific responsibility spanning the Directorates of Primary and Secondary Education of Achaea, as well as the Directorates of Primary and Secondary Education of Cephalonia. He is also an Instructor and member of the Adjunct Faculty (SEPO) at the Hellenic Open University (HOU). His research interests include a deep understanding of how people interact, collaborate, work, and learn within technology-enhanced blended learning environments, as well as the application of modern learning theories using new and emerging learning technologies in distance education and blended learning, with a particular emphasis on the field of learning design for the professional development of teachers. He has authored 12 books and more than 150 scientific papers published in international and Greek scientific journals and conference proceedings. Among these is the teacher training textbook for Level A (Introductory) ICT training. (https://users.sch.gr/papadakis/new/el/cv/)

Speech Title:
"From Traditional Teaching to Collaborative Learning: Modern Educational Models Supported by Digital Media in the Classroom"

In the era of digital education and artificial intelligence, the need for more engaging and effective instructional approaches is more imperative than ever. This presentation focuses on the transition from traditional teaching to collaborative learning, leveraging modern educational models and advanced digital media. Specifically, it will present the Flipped Classroom model and the implementation of small-group collaborative learning through Team-Based Learning (TBL), aimed at actively engaging students in the learning process. Additionally, it will highlight the use of the Learning Activity Management System (LAMS) as a tool for designing and implementing educational activities that enhance student interaction, critical thinking, and collaboration. Through examples and best practices, the talk will demonstrate how digital media can transform the instructional approach, making learning more dynamic, experiential, and effective.

"Από την Παραδοσιακή Διδασκαλία στη Συνεργατική μάθηση: Σύγχρονα Μοντέλα Εκπαίδευσης με Ψηφιακά Μέσα υποστήριξης στην Τάξη"

Στην εποχή της ψηφιακής εκπαίδευσης και της τεχνητής νοημοσύνης, η ανάγκη για πιο ελκυστικές και αποτελεσματικές διδακτικές προσεγγίσεις είναι πιο επιτακτική από ποτέ. Η παρούσα ομιλία εστιάζει στη μετάβαση από την παραδοσιακή διδασκαλία στη συνεργατική μάθηση, αξιοποιώντας σύγχρονα εκπαιδευτικά μοντέλα και προηγμένα ψηφιακά μέσα. Ειδικότερα, θα παρουσιαστεί το μοντέλο της Ανεστραμμένης Τάξης (Flipped Classroom) και η εφαρμογή της συνεργατικής μάθησης σε μικρές ομάδες (Team-Based Learning - TBL), με στόχο την ενεργή συμμετοχή των μαθητών στη μαθησιακή διαδικασία. Παράλληλα, θα αναδειχθεί η χρήση του Learning Activity Management System (LAMS) ως εργαλείου σχεδιασμού και υλοποίησης εκπαιδευτικών δραστηριοτήτων που ενισχύουν τη διάδραση, την κριτική σκέψη και τη συνεργασία των μαθητών. Μέσα από παραδείγματα και καλές πρακτικές, η ομιλία θα αναδείξει πώς τα ψηφιακά μέσα μπορούν να μεταμορφώσουν τη διδακτική προσέγγιση, καθιστώντας τη μάθηση πιο δυναμική, βιωματική και αποτελεσματική.

Invited Speaker:
Themistoklis Exarchos, Associate Professor
Ionian University

Themis Exarchos is an Associate Professor in the Department of Informatics at the Ionian University, Corfu, and Director of the Bioinformatics and Human Electrophysiology Laboratory. He holds a Diploma in Computer Engineering and Informatics from the University of Patras and a Ph.D. in Medical Informatics from the Faculty of Medicine at the University of Ioannina. He has published more than 65 journal articles, over 80 papers in conference proceedings, and more than 15 book chapters. He has worked for over 20 years on research and development projects funded by the EU and other organizations.

Speech Title:
"Developing Large Language Models to Support Teachers in Essay Evaluation"

Large Language Models (LLMs) are transforming the educational process, enabling the accurate and consistent analysis and grading of essays while offering the potential for personalized recommendations. The AISE project leverages this cutting-edge technology to support secondary education teachers through an LLM-based digital platform. The proposed methodology involves collecting and annotating essays from four countries (Greece, Cyprus, Croatia, Serbia), splitting them into training and test sets, constructing specialized knowledge bases for each evaluation dimension (Content, Organization, Language), and finally, utilizing Retrieval-Augmented Generation (RAG) for their thorough evaluation. Early results from 451 essays demonstrate a satisfactory balanced evaluation accuracy (e.g., 83.3% in the Content dimension), where the application of the RAG technique drastically reduces the phenomenon of hallucinations in LLMs. In conclusion, the AISE project highlights the value of LLMs in education for effective evaluation within the learning process.

Προσκεκλημένος Ομιλητής:
Έξαρχος Θεμιστοκλής,
Αναπληρωτής Καθηγητής, Ιόνιο Πανεπιστήμιο

Ο Θέμης Έξαρχος είναι Αναπληρωτής Καθηγητής στο Τμήμα Πληροφορικής του Ιονίου Πανεπιστημίου, Κέρκυρα και Διευθυντής του Εργαστηρίου Βιοπληροφορικής και Ανθρώπινης Ηλεκτροφυσιολογίας. Είναι διπλωματούχος μηχανικός, από το Τμήμα Μηχανικών Η/Υ και Πληροφορικής του Πανεπιστημίου Πατρών και κάτοχος διδακτορικού διπλώματος στην Ιατρική Πληροφορική από την Ιατρική Σχολή του Πανεπιστημίου Ιωαννίνων. Έχει περισσότερες από 65 δημοσιεύσεις σε περιοδικά, περισσότερες από 80 δημοσιεύσεις σε πρακτικά συνεδρίων και περισσότερες από 15 δημοσιεύσεις σε βιβλία. Έχει εργαστεί για περισσότερα από 20 χρόνια σε ερευνητικά και αναπτυξιακά έργα, χρηματοδοτούμενα από την ΕΕ και άλλους φορείς.

Θέμα Ομιλίας:
«Ανάπτυξη μεγάλων γλωσσικών μοντέλων για την υποστήριξη καθηγητών στην αξιολόγηση εκθέσεων»

Τα Μεγάλα Γλωσσικά Μοντέλα (ΜΓΜ) μετασχηματίζουν την εκπαιδευτική διαδικασία, επιτρέποντας την ανάλυση και βαθμολόγηση εκθέσεων με ακρίβεια και συνέπεια δίνοντας την δυνατότητα παροχής προσωποποιημένων συστάσεων. Το έργο AISE αξιοποιεί αυτήν την τεχνολογία αιχμής για την υποστήριξη καθηγητών δευτεροβάθμιας εκπαίδευσης μέσω μιας ψηφιακής πλατφόρμας βασισμένης σε ΜΓΜ. Η προτεινόμενη μεθοδολογία περιλαμβάνει συλλογή και επισημείωση εκθέσεων από τέσσερις χώρες (Ελλάδα, Κύπρος, Κροατία, Σερβία), τον διαχωρισμό τους σε σύνολα εκπαίδευσης και δοκιμής, την δημιουργία εξειδικευμένων βάσεων γνώσης ανά διάσταση αξιολόγησης (Περιεχόμενο, Οργάνωση, Γλώσσα) και τέλος την χρήση ενίσχυσης μέσω ανάκτησης γνώσης (retrieval augmented generation - RAG) για την ενδελεχή αξιολόγησή τους. Πρώιμα αποτελέσματα από 451 εκθέσεις δείχνουν επαρκή εξισορροπημένη ακρίβεια αξιολόγησης (π.χ. 83.3% στην διάσταση του Περιεχομένου), όπου η χρήση της τεχνικής RAG μειώνει δραστικά το φαινόμενο των ψευδαισθήσεων στα ΜΓΜ. Εν κατακλείδι, το έργο AISE αναδεικνύει την αξία των ΜΓΜ στην εκπαίδευση για την αποτελεσματική αξιολόγηση στην εκπαιδευτική διαδικασία.

Invited Speaker:
Longo Francesco,
Associate Professor, University of Calabria, Italy

Francesco Longo is currently Associate Professor at University of Calabria, Italy (where he is part of the Industrial Engineering group) and Director of the Modeling & Simulation Center - Laboratory of Enterprise Solutions (MSC-LES Lab). He has a strong background in Modeling & Simulation as well as VR, AR and MR applied to different sectors. He oversees the development and implementation of the cutting-edge research and initiatives in which the MSC-LES lab is involved. With a passion for technology and enabling methodologies, he has a track record of successful R&D projects and publications and he serves as General and Program Chair in well known international Conferences such as I3M (International Multidisciplinary Modeling & Simulation Multiconference) and ISM (International Conference on Industry of the Future and Smart Manufacturing).

Speech Title:
«An overview of trends, challenges and opportunities in integrating AI, VR and AR in Management Engineering Education»

This talk investigates how the convergence of different enabling technologies and methodologies of the Fourth and Fifth Industrial Revolutions (Industry 4.0 and 5.0) can be seamlessly used for education and training in the enlarged Industrial Engineering domain. The presentation passes through different real-world case studies that make use of Artificial Intelligence, Simulation, Virtual Reality, Augmented Reality and Mixed Reality highlighting their potentials and benefits both as stand-alone approaches and as integrated solutions. For each case study, tools, development approaches and related systems functionalities will be presented.

Προσπεκλημένος Ομιλητής:
Longo Francesco, Αναπληρωτής Καθηγητής, Πανεπιστήμιο της Καλαβρίας, Ιταλία

Ο Francesco Longo είναι Αναπληρωτής Καθηγητής στο Πανεπιστήμιο της Καλαβρίας στην Ιταλία (όπου ανήκει στην ομάδα Μηχανολόγων Μηχανικών Παραγωγής και Διοίκησης) και Διευθυντής του Κέντρου Μοντελοποίησης & Προσομοίωσης - Εργαστήριο Επιχειρησιακών Λύσεων (MSC-LES Lab). Διαθέτει ισχυρό υπόβαθρο στη Μοντελοποίηση & Προσομοίωση, καθώς και στην Εικονική (VR), Επαυξημένη (AR) και Μικτή Πραγματικότητα (MR) εφαρμοσμένες σε διάφορους τομείς. Επιβλέπει την ανάπτυξη και την υλοποίηση της έρευνας αιχμής και των πρωτοβουλιών στις οποίες εμπλέκεται το εργαστήριο MSC-LES. Με πάθος για την τεχνολογία και τις μεθοδολογίες ενδυνάμωσης, έχει στο ενεργητικό του επιτυχημένα έργα Έρευνας και Ανάπτυξης (R&D) και δημοσιεύσεις, ενώ υπηρετεί ως Γενικός Πρόεδρος και Πρόεδρος Προγράμματος σε γνωστά διεθνή συνέδρια, όπως το I3M (International Multidisciplinary Modeling & Simulation Multiconference) και το ISM (International Conference on Industry of the Future and Smart Manufacturing).

Θέμα Ομιλίας:
«Μια επισκόπηση των τάσεων, προκλήσεων και ευκαιριών στην ενσωμάτωση της Τεχνητής Νοημοσύνης (AI), της Εικονικής (VR) και της Επαυξημένης Πραγματικότητας (AR) στην εκπαίδευση Μηχανικών Παραγωγής και Διοίκησης»

Η παρούσα ομιλία εξετάζει πώς η σύγκλιση διαφορετικών τεχνολογιών και μεθοδολογιών ενδυνάμωσης της Τέταρτης και Πέμπτης Βιομηχανικής Επανάστασης (Industry 4.0 και 5.0) μπορεί να χρησιμοποιηθεί απρόσκοπτα για την εκπαίδευση και την κατάρτιση στον διευρυμένο τομέα της Μηχανικής Παραγωγής και Διοίκησης. Η παρουσίαση αναλύει διάφορες πραγματικές μελέτες περίπτωσης (case studies) που αξιοποιούν την Τεχνητή Νοημοσύνη, την Προσομοίωση, την Εικονική Πραγματικότητα, την Επαυξημένη Πραγματικότητα και τη Μικτή Πραγματικότητα, αναδεικνύοντας τις δυνατότητες και τα οφέλη τους τόσο ως αυτόνομες

προσεγγίσεις όσο και ως ολοκληρωμένες λύσεις. Για κάθε μελέτη περίπτωσης, θα παρουσιαστούν τα εργαλεία, οι προσεγγίσεις ανάπτυξης και οι σχετικές λειτουργικότητες των συστημάτων.

Workshop Description

The educational robotics workshop is designed for primary and secondary education teachers who wish to integrate robotics into their teaching practice. The goal is to familiarize participants with the fundamental principles of robotics and to understand how it can be utilized as a tool for discovery learning.

The workshop begins with an introduction to educational robotics and its philosophy. Teachers learn about the benefits of incorporating robotic activities in the classroom, such as developing computational thinking, enhancing collaboration and creativity, as well as cultivating problem-solving skills. Examples from international applications and research data demonstrating the effectiveness of this method are discussed.

In the theoretical part, participants become familiar with basic robotics concepts such as motors, sensors (ultrasonic, color, touch), control structures (loops, conditions), and programming logic. Various educational robotics platforms are presented, with emphasis on user-friendly systems such as LEGO.

The hands-on part constitutes the main focus of the workshop. Teachers are divided into groups and build simple robotic vehicles using the available kits. They learn to program their robots using programming blocks, starting from simple movement commands (e.g., moving forward for a specific distance) and progressing to more complex scenarios involving sensor usage (e.g., obstacle avoidance, line following).

During the practical activities, teachers face real challenges and learn debugging and problem-solving techniques. This hands-on experience helps them understand the difficulties their students might encounter, as well as develop support strategies.

A significant part of the workshop concerns teaching methodology. Discussion topics include ways to integrate robotics into various subject areas (mathematics, physics, language), designing robotic activities based on real-life scenarios, and utilizing gamification to increase student engagement. Teachers learn how to create progressive learning scenarios, starting from simple tasks and gradually increasing complexity.

The workshop concludes with group presentations, where each team demonstrates the solution they developed for a given challenge. This not only reinforces collaborative learning but also provides ideas for activities they can implement in their classrooms. Teachers leave with practical materials, lesson plans, and the confidence to begin their own journey in educational robotics.

Περιγραφή Εργαστηρίου

Το σεμινάριο εκπαιδευτικής ρομποτικής απευθύνεται σε εκπαιδευτικούς πρωτοβάθμιας και δευτεροβάθμιας εκπαίδευσης που επιθυμούν να εντάξουν τη ρομποτική στη διδακτική τους πράξη. Στόχος είναι η εξοικείωση των συμμετεχόντων με τις βασικές αρχές της ρομποτικής και η κατανόηση του τρόπου με τον οποίο αυτή μπορεί να αξιοποιηθεί ως εργαλείο ανακαλυπτικής μάθησης.

Το workshop ξεκινά με μια εισαγωγή στην εκπαιδευτική ρομποτική και τη φιλοσοφία της. Οι εκπαιδευτικοί γνωρίζουν τα οφέλη της ενσωμάτωσης ρομποτικών δραστηριοτήτων στην τάξη, όπως η ανάπτυξη υπολογιστικής σκέψης, η ενίσχυση της συνεργασίας και της δημιουργικότητας, καθώς και η καλλιέργεια δεξιοτήτων επίλυσης προβλημάτων. Συζητούνται παραδείγματα από διεθνείς εφαρμογές και ερευνητικά δεδομένα που αποδεικνύουν την αποτελεσματικότητα της μεθόδου.

Στο θεωρητικό μέρος, οι συμμετέχοντες εξοικειώνονται με βασικές έννοιες της ρομποτικής όπως οι κινητήρες, οι αισθητήρες (υπερήχων, χρώματος, αφής), οι δομές ελέγχου (loops, conditions) και η λογική προγραμματισμού. Παρουσιάζονται διάφορες πλατφόρμες εκπαιδευτικής ρομποτικής, με έμφαση σε εύχρηστα συστήματα όπως το LEGO.

Το πρακτικό μέρος αποτελεί το κύριο σημείο του σεμιναρίου. Οι εκπαιδευτικοί χωρίζονται σε ομάδες και κατασκευάζουν απλά ρομποτικά οχήματα χρησιμοποιώντας τα διαθέσιμα κιτ. Μαθαίνουν να προγραμματίζουν τα ρομπότ τους χρησιμοποιώντας blocks προγραμματισμού, ξεκινώντας από απλές εντολές κίνησης (π.χ. κίνηση προς τα εμπρός για συγκεκριμένη απόσταση) και προχωρώντας σε πιο σύνθετα σενάρια που περιλαμβάνουν χρήση αισθητήρων (π.χ. αποφυγή εμποδίων, ακολουθία γραμμής).

Κατά τη διάρκεια των πρακτικών δραστηριοτήτων, οι εκπαιδευτικοί αντιμετωπίζουν πραγματικές προκλήσεις και μαθαίνουν τεχνικές debugging και επίλυσης προβλημάτων. Αυτή η hands-on εμπειρία τους βοηθά να κατανοήσουν τις δυσκολίες που ενδέχεται να αντιμετωπίσουν οι μαθητές τους, καθώς και να αναπτύξουν στρατηγικές υποστήριξης.

Ένα σημαντικό κομμάτι του workshop αφορά τη διδακτική μεθοδολογία. Συζητούνται τρόποι ενσωμάτωσης της ρομποτικής σε διάφορα γνωστικά αντικείμενα (μαθηματικά, φυσική, γλώσσα), η σχεδίαση ρομποτικών δραστηριοτήτων βασισμένων σε σενάρια πραγματικής ζωής, και η αξιοποίηση της παιχνιδοποίησης για την αύξηση του engagement των μαθητών. Οι εκπαιδευτικοί μαθαίνουν πώς να δημιουργούν προοδευτικά σενάρια μάθησης, ξεκινώντας από απλές εργασίες και αυξάνοντας σταδιακά την πολυπλοκότητα.

Το σεμινάριο κλείνει με παρουσιάσεις των ομάδων, όπου κάθε ομάδα επιδεικνύει τη λύση που ανέπτυξε σε μια δοσμένη πρόκληση. Αυτό όχι μόνο ενισχύει τη συνεργατική μάθηση, αλλά δίνει και ιδέες για δραστηριότητες που μπορούν να μεταφέρουν στην τάξη τους. Οι εκπαιδευτικοί αποχωρούν με πρακτικό υλικό, σχέδια μαθημάτων, και την αυτοπεποίθηση να ξεκινήσουν τη δική τους πορεία στην εκπαιδευτική ρομποτική.

INNOVATIVE APPROACHES TO TEACHING: THE CONTRIBUTION OF AUGMENTED AND VIRTUAL REALITY TO LEARNING ENGLISH THROUGH PHYSICAL ACTIVITY

Vasiliki Karmi
PE06 English Language Teacher
Directorate of Secondary Education of Kerkyra
Kerkyra, Greece
e-mail: vaskarmi1976@gmail.com

Panagiotis Androutsopoulos
PE11 Educational Advisor
Directorate of Secondary Education of Ilias
Pyrgos Ilias, Greece
e-mail: panagiotisandrouts@gmail.com

ABSTRACT

This research paper examines the application of Augmented Reality (AR) and Virtual Reality (VR) in the teaching of English language through physical activity in upper secondary and lower secondary schools in western Greece.

The impact of digital technologies on improving language skills and enhancing motor engagement was evaluated using a sample of 65 students and 15 teachers. Based on the principles of active learning, the project included interactive scenarios in which students practised language skills through physical and collaborative activities.

The results showed significant improvements in participation, language proficiency (vocabulary, pronunciation) and memory through movement. Additionally, enhanced social interaction and cooperation were observed. Notwithstanding the favourable outcomes, certain challenges were identified, including the substantial cost of the necessary equipment and the necessity for teacher training in the use of these technologies.

Therefore, combining AR and VR with physical activity emerges as an innovative educational practice with potential application in wider educational settings.

Keywords: Digital media, AR, VR, English language, physical activity.

STOP MOTION: A DESIGN-BASED TOOL FOR EDUCATIONAL MATERIAL DEVELOPMENT

e-mail: pkyratsis@uowm.gr

ABSTRACT

The present study investigates the application of the Stop Motion technique as a tool for the creation of educational material, highlighting its contribution to active learning and to the development of cognitive, social, and technical skills. Stop Motion is particularly suitable for pedagogical applications that promote experiential and creative learning, enhancing students' personal expression, collaboration, and narrative competence. Through the use of physical materials, tools, and technological media, students gain hands-on learning experiences, assume the roles of creators and storytellers, and learn how to plan and implement complex projects with pedagogical content.

The study examines both the theoretical foundation of the method and its practical implementation. Furthermore, it presents the benefits and challenges associated with integrating Stop Motion into the classroom, as well as suggestions for its effective use by educators. Finally, the interdisciplinary and inclusive potential of the technique is emphasized, as it allows for adaptation to students' needs, fostering pedagogical innovation and the active participation of all learners. This approach reflects contemporary teaching methodologies, in which the learner is placed at the center of the educational process and technology functions as a supportive means for the development of creativity and a culture of collaboration.

Keywords: stop motion, educational material, digital storytelling, experiential learning, creativity, collaborative learning, technology in education, prototyping, project-based learning (PBL), inclusion, emotional empowerment

THE FUTURE OF DISTANCE LEARNING FROM THE PERSPECTIVE OF SECONDARY SCHOOL STUDENTS IN THE PREFECTURES OF ATTICA AND CYCLADES

Vlassopoulos Gerasimos
Postdoctoral Researcher, PhD, MSc, Educator PE82
University of West Attica, Department of Biomedical Sciences – School of Health and Care Sciences
Athens, Greece
e-mail: makisvlass@gmail.com

ABSTRACT

Periods of crisis often trigger radical social transformations. In Greece, the COVID-19 pandemic emerged in February 2020, leading to school closures and the mandatory implementation of distance learning.

This study investigates the future of Distance Education (DE) through the perspective of secondary education students. We employed a mixed sampling method (Stratified and Cluster sampling), involving 462 Junior High and High School students from the Prefectures of Attica and the Cyclades. The research was conducted in May 2020. We collected data via LimeSurvey and performed the statistical analysis using SPSS (v.25) under an academic license. The methodology included a reliability check of the questionnaire using Cronbach's alpha, descriptive statistics, factor analysis, and Chi-square testing.

The Chi-square analysis revealed that 76.2% of students did not wish for the future implementation of DE, while only 13% considered it a significant form of education and favored its future use.

In conclusion, Distance Education was not methodically organized based on pedagogical methods and techniques, leading to its rejection by the educational community. The views of secondary school students (General and Vocational High Schools) were negatively affected; consequently, they do not support a potential future application of DE, given the failure to implement its core governing principles.

Keywords: Distance Education, E-learning, Information and Communication Technologies (ICT), Synchronous Learning, Asynchronous Learning.

Abbreviations: Simple Random Sampling (SRS), Distance Education (DE), Information and Communication Technologies (ICT).

FACTORS AFFECTING STUDENTS' PARTICIPATION IN DISTANCE LEARNING DURING THE PANDEMIC

Zioga Styliani
ICT Teacher, 1st General High School of Ioannina
Ioannina, Greece
email: ziogastella68@gmail.com

ABSTRACT

This study explores the experience of high school students with distance learning during the pandemic, examining the factors that influenced their response. The aim was to investigate students' interest and the technological and pedagogical factors that affected their participation, analyze their perceptions regarding support, interaction, educational materials, the quality of learning management systems, and the role of the family. The research was conducted in October 2020 with 100 first- and second-year high school students from Ioannina, using a digital questionnaire consisting of 12 closed-ended and multiple-choice questions. The results showed that reliance on technology created problems (equipment, connectivity), negatively impacting student participation, while teachers had to take on new roles. Students faced technical issues that were resolved relatively quickly, but the culture of conventional education made adaptation to distance learning difficult. They expressed negative perceptions regarding communication and support from teachers, as well as the quality of educational materials, while the family played a significant role in their support.

Keywords: Distance Learning, Pandemic, Support, Interaction

ABSTRACT

This research paper examines the application of Artificial Intelligence (AI) in the field of Physical Education, with an emphasis on teachers' knowledge. The use of AI in education has rapidly expanded in recent years, offering significant potential to adapt and enhance the educational experience. However, in the domain of Physical Education, its adoption remains limited, primarily due to a lack of knowledge and training. This study aims to explore the level of understanding and acceptance of AI among educators, focusing on its prospects for integration into teaching practices.

The study followed a quantitative research approach, collecting data through online questionnaires distributed to Physical Education teachers across Greece. The sample consisted of 250 Physical Education teachers working in primary and secondary education. Data analysis was conducted using descriptive and inferential statistical methods with the SPSS software.

The results revealed significant gaps in teachers' knowledge of AI. 23.6% reported no familiarity, while 37.2% indicated a low level of familiarity. Only 32.4% reported a moderate level, and the percentages of those who felt highly familiar were remarkably low (High: 6.0%, Very high: 0.8%). Familiarity with basic principles, such as AI functions and types, was also limited, with some participants recognizing only the most widely known applications. A positive correlation was found between professional development in ICT and AI ($\rho = 0.176$, $p = 0.005$). Teachers who had received ICT training were more likely to have experience with or interest in AI-related training. This suggests that prior education in technology generally increases interest in more specialized areas. About practical experience, most teachers reported not having used AI technologies in education or other sectors.

The research's findings highlight a strong need for professional development in AI for Physical Education teachers. Participants recognized the importance and usefulness of such initiatives for the educational process. Despite the relative lack of familiarity that emerged in the results, the majority of participants evaluated the training in this area as very useful, a result that highlights the need for professional development in this field.

ABSTRACT

The new Curricula are based on learning outcomes, i.e. everything that students need to know, understand and be able to apply after completing each learning process, shifting the focus of emphasis from the subject matter, the teachers and the teaching process to the students and the expected learning outcomes. At the core of the teaching methodology are the creation of guided learning environments, self-motivation, collaborative action in groups, inquiry-based learning, experiential approach, collaborative problem solving, communicative approach and transformative logic.

The present teaching scenario, has as its theme the "digital" organization of the school library and was implemented within the framework of a cultural program with the participation of students of a Day High School in Attica, enhancing collaborative learning with the help of ICT and achieving cognitive teaching objectives related to spreadsheets, collaborative documents and web explorations. Its implementation was based on the use of the e-grafis service provided by the Panhellenic School Network and has as a prerequisite the creation and use of Student Accounts for all participants. The design of the scenario includes four implementation phases, cognitive and psycho-emotional objectives, feedback before each new phase, evaluation at the end and reflection on the activities.

For the design and implementation of the educational scenario, the project method was applied and the teaching strategies followed were direct teaching and discovery learning. During the implementation of the scenario, it was observed that collaborative learning with the help of computers promotes the cultivation of social skills such as communication and cooperation and the cultivation of digital skills, mainly through the management of collaborative environments for the implementation of activities. At the same time, it was found that the use of Digital Media in cultural programs or in skills workshops can enhance the dynamics of teaching, stimulate student interest, improve the learning climate and enhance the effectiveness of the educational process. The topic of the project and the guidance from the teacher were mentioned as the main positive factors, while the time of the project was mentioned as the most important negative factor. Finally, the different speed at which the members of a group work was mentioned as the most important problem of collaborative action.

Keywords: collaborative learning, e-grafis, web exploration, ICT, educational scenario, curriculum, cultural program

TEACHING QUANTUM THEORY IN SECONDARY EDUCATION: THE DOUBLE-SLIT EXPERIMENT AND THE DEVELOPMENT OF AN ICT-BASED EDUCATIONAL SCENARIO FOR 9TH GRADE STUDENTS

Maria Magaliou
Physics Teacher - PHD candidate, Department of Pedagogy and Primary Education,
National and Kapodistrian University of Athens
email: mvpmag@gmail.com

ABSTRACT

Quantum physics, despite its perceived complexity, forms the foundation of numerous modern technologies shaping our daily lives. From the computers we use to medical diagnostic imaging, quantum theory is integral to contemporary living. However, in Greece, its teaching in Secondary Education is primarily limited to students preparing for university entrance exams, thus excluding a significant portion of the student population from engaging with these fascinating concepts. Quantum theory raises profound questions about the nature of reality, knowledge, and the role of the observer. The double-slit experiment, an iconic phenomenon illustrating fundamental quantum concepts and philosophical implications, is notably absent from the Greek secondary school curriculum. Yet, teaching it can be a powerful tool not only for fostering scientific understanding but also for developing critical thinking.

This paper proposes a teaching scenario for 9th-grade students (third year of Gymnasium, in the Greek system) that leverages Information and Communication Technologies (ICT), specifically educational videos and PhET Colorado simulations ("Wave Interference," "Quantum Wave Interference"), to introduce the double-slit experiment. The scenario aims to promote active student participation, develop critical thinking skills, and connect scientific knowledge with broader philosophical and societal questions.

The core research question explored is: How can a teaching scenario utilizing ICT enhance the instruction of the double-slit experiment in Secondary Education, and how do students perceive and accept the teaching of quantum topics through these tools? Specifically, the research focuses on evaluating the effectiveness of ICT in teaching quantum concepts like wave-particle duality and how these technologies assist students in achieving a more accessible and meaningful understanding of the Double-Slit Experiment.

Preliminary findings from the pilot implementation of the scenario with 9th-grade students indicate that introducing basic quantum concepts at this age is feasible. The integration of ICT appeared to significantly increase student interest, enhance participation, and contribute to the development of a deeper understanding of quantum phenomena, particularly wave-particle duality as manifested in the double-slit experiment. While these initial results are encouraging, further large-scale research is required to fully assess the effectiveness of ICT and investigate the factors influencing student acceptance and comprehension of these abstract scientific domains.

Keywords: Quantum physics, Teaching scenario, Double-slit experiment, Information and Communication Technologies (ICT), Critical thinking

SCIENCE TEACHERS' ATTITUDES AND BELIEFS TOWARDS THE USE OF AI TOOLS IN EDUCATION

Velestino, Greece

ABSTRACT

As the development of AI-based tools progresses and their use in science teaching expands, it becomes obvious that it creates many opportunities to improve teaching and consequently learning outcomes. Moreover, the study of teachers' beliefs and attitudes towards the integration of T.N. in the educational process emerges as an important issue. The results of many studies in science (S.E.) teaching indicate the diverse and imminent roles of A.I. in education. However, P.E. teachers have, in the last decade, faced a particularly challenging challenge, the use of A.I. in the classroom without a significant central planning to support them.

The present study investigates the attitudes and beliefs of 40 teachers of secondary education in Thessaly and Epirus, towards the integration of the existing tools in their classrooms. In particular, this research studies the teachers' views on the AI tools, such as Gemini, the program for summarizing pdf files with artificial intelligence, Gamma.app, which have a potential role in improving pedagogical practices. To collect the survey data on the evaluation of teachers' attitudes and beliefs, a 19-question closed-ended questionnaire was designed and distributed to them and the responses were given on the 4-point Likert scale.

The results of the responses show that although the majority of teachers are familiar with the use of computers and the use of interactive whiteboards in their daily teaching, they feel largely skeptical about the use of AI tools and furthermore they state that they have incomplete knowledge of these tools and that they believe that they are unprepared to proceed in using these tools effectively in the classroom, The results indicate the need to create a training program for teachers in order to improve their knowledge and skills.

Keywords: teachers, questionnaire, artificial intelligence

EDUCATIONAL ACTIVITIES AND INNOVATION: THE SAFFRON OF KOZANI AND BEE-BOT AS TEACHING TOOLS

Antigoni Tsirou ICT Teacher, MSc
Directorate of Primary Education of Kozani, Ministry of Education and Religious Affairs
Kozani, Greece
e-mail: tsirouant@gmail.com

ABSTRACT

This research explores the effectiveness of the "Saffron of Kozani" educational activity in combination with the use of the Bee-Bot robot in mixed groups of primary education students in the Kozani region. The study focuses on connecting local culture, traditions, and the economic significance of saffron with the educational process, while also leveraging innovative robotics technology to enhance group learning and programming skills.

As part of the study, an electronic questionnaire (via Google Forms) was created and distributed to 32 educators after the completion of the saffron-related educational activities. The educators responded anonymously, and the data was automatically collected and processed, allowing for a systematic analysis of their views regarding the connection between the teaching topic and real life, as well as the use of the Bee-Bot robot in the classroom.

The methodology included recording demographic data (gender, age, educational level, years of service), indicating a sample of experienced educators, with a dominant presence of women and significant professional experience. The research results reveal that the educators consider the topic of saffron to be closely linked to the students' everyday lives, highlighting its value in terms of local culture, customs, and the regional economy.

At the same time, the use of the Bee-Bot robot enhanced collaborative learning, promoting mutual interaction, critical and creative thinking, as well as hands-on familiarization with basic principles of computational thinking. Educators observed notable benefits regarding the participation of all students, including those who are academically weaker, and the reinforcement of socio-emotional skills.

The overall findings confirm a positive attitude toward the integration of innovative practices in teaching, emphasizing the need for further training in the use of robotic tools. This abstract offers a concise overview of the research, inviting the reader to delve deeper into the methodology and findings, which contribute to improving educational practice.

This study presents not only the direct impact of innovative methods on learning but also the prospects for future applications that can enhance the quality of the educational process.

Keywords: Saffron of Kozani, Bee-Bot , differentiated instruction, teamwork, robotics, experiential learning.

EXPLORING THE DYNAMICS OF FRIENDSHIP NETWORKS USING ARTIFICIAL INTELLIGENCE ALGORITHMS: A STUDY IN A SPECIAL EDUCATION SCHOOL

verykios@eap.gr

ABSTRACT

Friendship is a fundamental condition for the healthy development of individual and social relationships, especially during the sensitive period of adolescence. While friendship is generally understood to be reciprocal and bidirectional, in the context of special education the distinction between friendship, companionship, and caregiving is often blurred. This ambiguity can lead to relationships that lack the mutual dynamics typically observed in mainstream schools, generating feelings of disappointment, isolation, and social exclusion.

This paper seeks to highlight the dynamics of friendship ties in a small special secondary school by employing directed network analysis. Through social network analysis, we compute metrics—some of which draw on artificial intelligence algorithms—to identify key roles and structural particularities within the students' friendship network. These metrics reveal hidden patterns and dynamics that are not immediately visible, offering valuable insights into their social interactions. The aim of the study is to provide educators and specialist practitioners with a tool to strengthen social relationships, combat isolation, and prevent bullying. The analysis uses anonymized data from 22 active students, each of whom nominated 3 to 5 friends.

The students are distributed across all eight grades of the Special Gymnasium–Lyceum (junior–senior high school), and their ages range from 14 to 22. In addition to basic measures that characterize the interaction network—such as in-degree and out-degree—we calculated centrality indices including closeness centrality, eigenvector centrality, betweenness centrality, and each node's eccentricity. We also computed the PageRank score as well as HITS (hubs and authorities). Particularly important results emerged from the measure of reciprocity, which was calculated both individually for each student and for the network as a whole. The findings point to differentiated student roles that go beyond simple popularity, with implications for the network's future evolution and for strengthening its cohesion. The graph analysis derived from these data, using the aforementioned metrics, provides a deeper understanding of the structure and dynamics of friendship relations, opening new avenues for promoting social inclusion and improving students' quality of life through targeted interventions.

ABSTRACT

The purpose of this study is to investigate the knowledge of primary school students regarding the use of artificial intelligence (AI) in education. To this end, a quantitative survey was conducted with a sample of 321 primary school students attending 4th, 5th, and 6th grade in the prefecture of Zakynthos. Data were collected through the distribution of a printed questionnaire to the students. The results of the study showed that the majority of students were familiar with the concept of artificial intelligence (78.5%) and had either used AI themselves or their parents had (59.7%). Data analysis revealed that students tend to agree that AI can create educational games that make learning more fun, can be used to develop educational games, can help students learn new languages more easily, and can assist in solving math problems with step-by-step explanations. Overall, students have a moderate to high level of knowledge about AI, a neutral attitude towards it, and moderately recognize its benefits in various aspects of everyday life. Finally, the findings indicated that an increase in students' knowledge and the formation of a more positive perception of AI positively influence their attitude towards the use of artificial intelligence in the educational process.

ABSTRACT

This research paper examines the impact of integrating digital technologies into Physical Education teaching in secondary education, with particular emphasis on gamification and the use of virtual reality (VR) and augmented reality (AR).

Through collecting qualitative and quantitative data from 15 teachers and 60 students in schools managed by the Regional Directorate of Education of Western Greece, this study aims to evaluate how these technologies enhance student participation, motivation, and motor skill development.

The findings demonstrate that digital tools enhance the level of student interest and engagement, particularly among those who demonstrate a limited level of engagement within the conventional teaching paradigm. However, critical challenges have emerged, particularly with regard to providing teachers with adequate training and technical support.

The study concludes with recommendations for the pedagogically informed integration of technology in Physical Education, with a view to improving teaching quality and promoting educational equity.

Keywords: Digital technologies, physical education, gamification, virtual reality (VR), educational outcomes

TEACHING THE COMPLETE LITERARY WORK "*HONOR AND MONEY*" BY K. THEOTOKIS USING I.C.T.

Vontitsou Anna
Teacher of Greek language
Second grade of Greek upper secondary school
Preveza, Greece
avontitsou@yahoo.gr

ABSTRACT

This presentation highlights the integration of I.C.T. (Information and Communication Technologies) in the teaching of literature in the second grade of Greek upper secondary school (B' Lyceum), focusing specifically on the novella *Honor and Money* by Konstantinos Theotokis. The use of digital tools—such as the internet, interactive whiteboard, e-class platform, audiovisual material (eBook, film), and artificial intelligence (language models)—contributes to the achievement of educational goals through innovative teaching methods.

The introduction outlines the curriculum frameworks of 2011, 2021, and 2023–2024, which aim to promote critical and digital literacy. It then discusses the positive role of I.C.T. in education, particularly in literature teaching, while also acknowledging the challenges involved.

The core of the presentation analyzes a teaching proposal based on the entire novella by Theotokis, implemented via the e-class platform. It describes the teaching model, methods, instructional steps, supporting materials, and sample worksheets. These include comprehension questions, opinion analysis, narrative techniques, intertextuality, paragraph visualization, changes in narrative mode or perspective, and guided written production with the help of A.I.

The presentation concludes by summarizing the outcomes of the interactive relationship between I.C.T. and literature teaching.

Keywords: literature, blended teaching model, use of I.C.T., artificial intelligence (A.I.), digital literacy, new curricula.

ASIA MINOR CATASTROPHE AND ASIA MINOR MONUMENTS: AN EDUCATIONAL INITIATIVE USING DIGITAL TOOLS

Giannouli Sofia
Philologist, PE02
1st Model Junior High School of Preveza with Lyceum Classes
Preveza, Greece
e-mail: alexandropoulosalekos@yahoo.com

ABSTRACT

This paper examines an educational initiative by the History student club titled "Asia Minor Catastrophe and Asia Minor Monuments", which was implemented at the 1st Model Junior High School of Preveza during the school year 2022-2023. The initiative aimed to foster a deeper understanding of both the history and memory of the Asia Minor Catastrophe by integrating innovative digital tools into the educational process. The paper analyzes how the use of technology enhanced the understanding of historical events, enabling students to approach and present history in a contemporary and interactive manner.

The methodology employed included the use of digital platforms for searching, analyzing, and processing historical sources, as well as developing student projects and creating presentations using presentation software (e.g., PowerPoint). Concurrently, digital tools were utilized for gathering photographic material, designing digital posters, and organizing digital events. A significant phase of the program involved the creation of a song, which was composed and produced using music software (such as GarageBand and FL Studio), alongside the development of a digital radio program where students presented historical data through a modern communication medium.

The main findings indicate the positive impact of using digital tools on enhancing student collaboration and creativity. The application of technological tools allowed students to participate actively in all phases of the project, strengthening critical thinking and their ability to produce digital content. Notably, the creation of the song and the digital radio program served as a highlight of the learning process, effectively combining music and historical memory with technology and offering students a powerful avenue for creative expression.

The results demonstrate that the combined use of traditional teaching methods and digital tools significantly enhances the educational process, equipping students with valuable skills for the modern era. Students developed competencies in critical thinking, expression, and collaboration within a digital environment, gaining experiences that reinforce their capacity to approach historical topics creatively and contemporarily.

Keywords: Asia Minor Catastrophe, historical memory, digital tools.

MUSIQUE CONCRÈTE AS AN INSTRUMENT FOR DIGITAL STORYTELLING: AN ELECTROACOUSTIC COMPOSITION WORKSHOP WITHIN THE FRAMEWORK OF THE MUSIC ENSEMBLES COURSE

Dimitrakopoulos Aristotelis
PhD Candidate at Ionian university, Substitute Secondary Education Teacher, Composer
Music School of Preveza, Greece

ABSTRACT

This scientific article explores the integration of Musique Concrète within the educational methodology of digital storytelling, examining the potential for integrating pre-designed sound into narrative practice. The emergence of Musique Concrète marked the advent of an era of experimentation in 20th-century music composition, with its fundamental tools consisting of digital processing, modification, and the re-arrangement of pre-recorded sounds. Its defining characteristic was the subversion of conventional boundaries in "traditional composition", as it challenged strict musical rules and fostered the formation of diverse soundscapes. Concurrently, the concept of digital storytelling is examined as an educational tool, which combines the use of technological means into the educational process with exploratory learning and reflection to formulate a structured and engaging narrative.

The composition workshop, which has been developed within the framework of the Music Ensembles' course in Music Schools, investigates methods through which students can develop their musical-narrative skills. This is achieved -not through the use of speech and visual media- but by employing sound design and the formation of original compositions in the model of Musique Concrète.

In order to develop the research objectives, the methodological axis of autoethnography is utilised, through which the teacher designs and modifies the lesson plan, balancing between the didactics of technical means and the philosophy of composition. The free software (DAW) Audacity is implemented for digital sound editing, and the Soundcloud streaming service is employed for archiving and cataloguing the students' compositions.

The research project focuses on the teaching of Musique Concrète to students from Middle and High School of Greek Music Schools, with a view to stimulating imagination, promoting collaborative work and deepening students' understanding of sound as a unique material for a storytelling. The overarching objective of the workshop is the composition of original music by the students themselves. This endeavour is of twofold significance: firstly, it serves as an inaugural portfolio for future reference; secondly, it amalgamates the elements of narration and sound design in the nascent stages of the sonification process. Furthermore, students' utilisation of the free software (DAW) Audacity for sound design enhances their technological proficiency and promotes the use of digital tools in the educational process. Simultaneously, the paper proposes an extension to the the curriculum of the Music Ensembles' course, with the aim of enhancing the educational goals of artistic expression and creation. Consequently, it presents the compositional process as an educational methodology that encourages creativity, digital literacy and technical proficiency.

Keywords: digital storytelling, electroacoustic composition, music education, digital literacy

RECONNECTING STUDENTS: ENSURING EMOTIONAL GROWTH IN A DIGITALLY DRIVEN EDUCATIONAL SYSTEM

Maria Kardama
English Language and Literature Teacher
1st Vocational School of Kato Achaia
Patra, Greece.
Email: mkardama@gmail.com

ABSTRACT

In today's educational setting, students who are largely dependent on media technologies for learning and communication may tend to prefer computer-mediated communication over face-to-face interaction. While digital technologies have numerous advantages, such transformation can hinder the development of some core social skills such as friendship making, teamwork and dealing with actual life, social issues that require emotional maturity and empathy. This presentation explores the potential long-term effects of excessive dependence on digital technology on the ability of students to engage in personal, interpersonal communication. We will look at the dilemma teachers facing in juggling digital learning with opportunities for students to gain essential soft skills in class. We will also discuss ways of integrating both digital and face-to-face interactions to produce balanced students who have the emotional intelligence needed to cope with complex social situations. Based on case studies, research, and real-life scenarios, valuable input will be given on how to encourage a balanced approach toward digital media in education so that students achieve good results academically as well as develop socially and emotionally.

Montessori School and Limited Screen Time, Flipped Classroom with In-Person Discussion, Tech-Free Study Hours, Online and Offline Reading Mix, Mindful Break Zones, Digital Detox Challenges are but a few modern pedagogical approaches that integrate technology while prioritizing human interaction to equip students with both technical knowledge and the interpersonal skills needed for success in their future career and personal life. By consistently recognizing and validating feelings and logical thinking, students are supported to build confidence, creativity and resilience, leading to a more supportive and participative classroom than the digitally based one. “Education must begin with the solution of the teacher-student contradiction, by reconciling the poles of the contradiction so that both are simultaneously teachers and students”, Paulo Freire highlights. This very much fosters interactive learning in which technology should serve to augment, not replace human contact and soft skill building. Even if technology can replicate real scenarios, communication, teamwork, empathy, and leadership develop best out of human interaction. Global competency goes far beyond language fluency. Good Emotional Intelligence (EI) is accumulated through real dialogues, clashes, and listening, which cannot be provided by a single technology tool. Teaching and learning require social concession, bargaining, and joint decision-making, which work best in real environments. Literally, technology needs to support—but not replace—the human connections that make learning really exciting and meaningful.

Key words: emotional intelligence, real life scenarios, human interaction, soft skills, balanced teaching approach

THE ROLE OF TEACHERS IN THE EFFECTIVE IMPLEMENTATION OF DIFFERENTIATED INSTRUCTION THROUGH THE UTILIZATION OF NEW TECHNOLOGIES

Keramida Areti
Education Counsellor
e-mail: aretikeramida@gmail.com

ABSTRACT

Modern learning theories acknowledge the need for an inclusive educational process that respects and takes into account the diversity of students within the framework of differentiated instruction. This methodology is based on the assumption that the teaching process needs to be differentiated and adapted according to the experiences, needs, diversity of the student population, as well as the specific characteristics of each class. The parameters that are differentiated include the learning environment, the content and process of learning, and the learning products, that is, how students demonstrate what they have learned.

Such a learning process, which pedagogically utilizes the theoretical assumptions of constructivism and new technologies, requires teachers to distance themselves from the traditional, conservative teacher-centered teaching model, which is often characterized by a skeptical attitude towards innovation in teaching and education in general. In the context of the above framework, this paper examines the role of the teacher in differentiated instruction, that is, how teachers should think and act before, during, and after the teaching process, reflecting and closely "listening" to the classroom in order to contribute to its successful implementation. Thus, we describe the characteristics that teachers need to have if they wish to move away from the traditional teacher-centered approach to teaching English and adopt an approach that focuses on students, their interests, learning styles, and needs, while also effectively utilizing new technologies.

In this discussion, we avoid "mechanistic" approaches from both Greek and foreign literature that focus on the "roles" of the teacher, because such an inflexible view does not align with the character of differentiated instruction, which, while an organized and systematic process, does not force the teacher to adopt specific and fixed classroom behaviour. Therefore, in this paper, the concept of the teacher's "role" refers to the characteristics that are useful for teachers attempting to apply the findings of research related to differentiated instruction and the use of new technologies.

Since the implementation of differentiated instruction requires the acceptance of a broader philosophy of the learning process, teachers need to adopt this philosophy and way of thinking for their teaching practice, be willing to move outside their "comfort zone" and try new ideas and teaching practices. It is important to move away from the perception of themselves as holders and distributors of knowledge and towards a view of their role as closer to that of "orchestrators of learning opportunities" taking on the role of a mentor. Additionally, it is essential that teachers systematically observe and monitor their students during individual or group work, identify their students' difficulties when they arise and provide support.

Finally, for their professional development, it is necessary for teachers to have knowledge of the theoretical principles of differentiated instruction, as this knowledge will help them identify the characteristics needed by teachers who aim to apply differentiation in teaching through new technologies at a practical level. At the same time, reflective and critical study of the primary literature will support them in their efforts to implement in the Greek educational system research findings from different educational systems with their own characteristics and particularities.

Keywords: differentiated instruction, new technologies, teachers' role

LEVERAGING MULTILITERACIES AND CREATIVE WRITING IN THE STORYTELLING TEACHING

Kostara Effrosyni
PhD Greek Language teacher, Laboratory Teaching Staff,
Department of Educational Sciences and Social Work
University of Patras, Greece
e-mail: frinikostara@g.upatras.gr

Kriketou Theodora
MEd Greek Language teacher, Secondary Education Teacher
Secondary Education of Achaia, Greece
e-mail: theodora.kriketou@gmail.com

ABSTRACT

The present article discusses issues that occupy an important place in the new Curricula and concerns, on one hand, the formulation of an alternative proposal for the teaching of storytelling, through the utilization of multiliteracies and creative writing, and, on the other hand, the investigation of the results that emerged from the implementation of this proposal. The teaching plan was designed and implemented for the purposes of Modern Greek Language course by the Greek Language teacher and Laboratory Teaching Staff of the Department of Educational Sciences and Social Work at the University of Patras, Ms. Effrosyni Kostara, and the Greek Language teacher at a High School, Ms. Theodora Kriketou and was applied during the 2024-2025 school year in the context of a model teaching session to first-year high school students in an urban school of Patras. After the completion of the teaching session, both the students and the teachers who attended the lesson were provided with questionnaires in order for the researchers to ascertain a) the effectiveness from the use of multiliteracies and creative writing in the teaching of storytelling and b) the contribution of multimodal texts to the development of creative writing skills.

Initially, the article presents the key aspects of multiliteracies theory and the contribution of creative writing in the development of students' linguistic and communicative skills, as well as to the enhancement of their creativity. Then, the implemented teaching scenario is outlined, the main goal of which is for students to discover and understand the macrostructure of narrative through the use of a multimodal text (video) and the collaborative production of their own narrative text in a specific communicative framework. The teaching approach includes activities for decoding semiotic modes of multimodal texts and creative writing, aiming to develop students' visual and critical literacy, as well as to cultivate collaborative storytelling skills. The methodology leverages collaborative group teaching and inquiry-based learning with the application of dialogic discussion techniques in plenary and student groups.

Finally, the article discusses the findings of the questionnaires distributed to students and teachers which are structured around three main axes. The first axis concerns the application of multiliteracies, the second focuses on the utilization of creative writing and the third is anchored on the results of the transition from the processing of multimodal text to creative writing. Based on the findings, the students understood the structure of narrative through the use of non-written text (video) and became familiar with other semiotic modes (such as images and sound) that can not only convey messages but also to present the development of a story. Furthermore, collaborative text production in groups helped students generate more ideas and express emotions more freely. Finally, it was observed that the multimodal elements of the video helped in the creation of their own stories, as the use of images contributed in shaping the style and atmosphere, while music and sound effects inspired ideas for the emotional development of the characters in the story.

Keywords: multiliteracies, multimodal texts, creative writing, creative storytelling.

TRANSFORMING PHYSICS TEACHING: THE ROLE OF CRITICAL PEDAGOGY AND ICTS

Maria Magaliou
Physics Teacher - PHD candidate, Department of Pedagogy and Primary Education,
National and Kapodistrian University of Athens, Greece
email: mvpmag@gmail.com

ABSTRACT

Modern physics teaching faces the challenge not only of transmitting knowledge but also of cultivating Critical Scientific Literacy, which involves developing critical thinking and connecting science with social issues. This paper examines how Critical Pedagogy, along with Information and Communication Technologies (ICTs), can contribute to achieving this crucial goal. While ICTs offer significant potential for making physics teaching more interactive and effective, their successful integration is hampered by considerable challenges. Critical Pedagogy, rooted in the work of Freire, provides the foundational framework for fostering dialogue, questioning, and the connection of physics with social and technological developments, essential components of Critical Scientific Literacy, making the subject matter more accessible and relevant. ICTs complement this approach by offering interactive environments, simulations, and opportunities for collaborative learning, thereby enhancing understanding, particularly of abstract concepts, within this critical framework. The paper identifies the key difficulties in ICTs integration concerning teachers, students, infrastructure, and pedagogy. The literature review suggests that the combined application of Critical Pedagogy and ICTs offers a powerful synergy that can transform physics teaching into an active, interactive, and socially oriented process, potentially mitigating some of these identified challenges and fostering Critical Scientific Literacy. Students develop critical thinking, actively construct knowledge, and understand physics as a living science connected to society, thus shaping responsible, engaged citizens equipped with Critical Scientific Literacy.

Keywords: Critical Pedagogy, Critical Scientific Literacy, Information and Communication Technologies (ICTs), Physics Teaching, Social justice

ABSTRACT

The subversive dynamics of the new technologies are recognised as factors of everyday life, nowadays, affecting both professional and academic elements, from the standpoint of basic education to the highest tier of knowledge. The present paper examines these new technologies that appear to imbalance at a great extent the academic community, namely big data analytics (BDA), robotic process automation (RPA), artificial intelligence (AI), Internal of Things (IoT) and distributed ledger technologies (DLT). The specific disruptive impetus is viewed through the disciplines of accounting and auditing, since graduates from the respective faculties face numerous challenges at the commencement of their professional engagement, lacking competitive skills and exhibit refusal in incorporating new technological methods at a later stage of their professional life.

This literature review attempts to sensitize the bearers of knowledge to adopt at the maximum level possible all the emerging technologies in both disciplines at all echelons of education, whilst exploring the importance of such incorporation for the receiver of knowledge and competency at the academic level. It finds that while new technologies augment the professional requirements of any activity entailed in accounting and auditing, the obligation for competency development is entrusted and bound to the higher education institutions of the respective fields. Data enhance the request to incorporate and adopt the practical use of the respective technologies, within the academic curriculum in a variety of methods, via multi facet technological tools and in a different degree of implementation. Furthermore, areas of improvement and deviation trends are presented, while assessing the tendency to retain academic curriculum status quo and flagging the negative factors of transmitting knowledge regarding new and impactful technologies via legacy tools, methods and applications. Moreover, the paper illustrates that the demand for updated formation of knowledge is downward directed to the previous tier of education, as a precursor of evolutionary competency customization.

Finally, this review finds strong evidence to support the prerequisite of soft skills development and improvement to the arsenal of the respective professional in order to manage the emerging technologies, to address their practical implications and to maximise their holistic aptitude as scholars, intellectuals and professionals. In conclusion, the present paper suggests areas and topics for future research in the level of Higher Education and the relative academic practices of implementation.

ABSTRACT

The research into the combined use of analog and digital technology in education, and specifically in the teaching of photographic act, constitutes the core focus of this article. The research questions center on the relationship between technology and photographic work, the transition from analog to digital photographic technology, and the understanding and use of media within the educational process. According to Bolz, the significance of a medium can only be understood through its interaction with other media - both contemporary and obsolete - and that older media serve as metaphorical aids for orientation within the digital realm (Bolz, 2008). Based on this perspective, a hands-on activity was designed as an educational practice in photography, which serves as the case study for the article. The methodology of the activity combines aspects of transformative and "incidental learning" (Bolz, 2008), alongside insights from visual culture scholars such as Gillian Rose. In the context of our current era - what Ong (2015) refers to as the "new orality," which connects new technologies to education and the role of digital imagery - the article seeks to intersect and integrate theoretical approaches and hands-on practices, aiming to draw conclusions regarding contemporary visual culture. The interaction between terms and critical theories brought to light both the influence of obsolete media on artistic production and the dynamic nature of the transition to new technologies. The activity was accompanied by a questionnaire, the findings of which offer valuable observations for educational practices and applications. The participants were primarily photography students, the majority of which responded positively, demonstrating that education through experiential practices has the potential to modify users' behavior towards a medium. At the same time, it revealed the participants' ability to understand and distinguish among different practices that define contemporary media. Overall, the playful dimension of the medium and the combined use of analog and digital technology emerged as an effective and valuable educational tool.

Keywords: new orality, digital photography, camera obscura, education, hands-on activity

ABSTRACT

The study examines learning as an active and dynamic process, in which students acquire knowledge through personal involvement and interaction with their environment, as well as with tools that support thinking and communication. It presents key theoretical approaches such as constructivism, which emphasizes the importance of experience and social interaction in the learning process, and activity theory, which views learning as a collective process shaped by social and cultural structures. Particular emphasis is placed on visual literacy, as images play a central role in modern communication, requiring students to develop skills in analyzing and creating visual content. Furthermore, the study highlights the transformative role of technology in the learning process, with the integration of Web 2.0 tools and the use of Bloom's digital taxonomy for developing higher-order thinking skills. Finally, it underlines the importance of pedagogical integration of digital media and the continuous professional development of educators, in order to provide learning experiences tailored to the needs and demands of the 21st century.abstract should include the focus of your paper, i.e., what your paper is about, a brief description of the steps or methodology used, the main findings of the paper, and its results.

Keywords: digital Media, pedagogical theories, learning.

ABSTRACT

The pedagogical integration of digital media into teaching practice refers to the use of technologies and digital tools to support and enhance teaching and learning. These media offer new opportunities for educators and students, enabling them to interact with the content in innovative and engaging ways.

Modern curricula, grounded in contemporary learning theories, increasingly incorporate digital media into the teaching of both STEM and Humanities subjects. This integration promotes active engagement and fosters a deeper, more comprehensive understanding of new knowledge.

In remote schools located in mountainous areas, such as the General Lyceum of P. Diasello in Arta, the challenge is greater. Although the school is technologically equipped—with interactive touchscreens and a fully independent IT lab—connectivity remains low or even non-existent. Despite this limitation, educators strive daily to integrate as many digital tools as possible into their teaching. The aim is to make learning more engaging and participatory, aligning with the framework set by the United Nations' Goal 4: Quality Education.

Indicative digital tools used include: Mentimeter, Mozabook, Storybird, Google Forms, Canva, and Kahoot. By interacting with these tools, students enhance their active participation in enjoyable ways, collaborate in teams, achieve a holistic understanding of new knowledge, and become able to transfer what they've learned to other learning environments. In this way, education becomes of higher quality for both students and teachers.

In conclusion, in a constantly evolving world, education must rise to its role—especially in semi-mountainous schools, which are tasked with bridging both learning and technological gaps for the new generation of students. This endeavor represents a powerful strategy for ongoing education, yet it requires a coordinated approach to overcome challenges and fully harness the potential of digital learning.

e-mail: georgoula.pr@gmail.com

ABSTRACT

This paper presents the experience from the implementation of an Action Plan titled "Music Technology in the Educational Process: Discovering Productivity through Recording", which was applied at the Music School of Amfissa during the 2024-2025 school year, within the framework of the Internal School Evaluation by the Institute of Educational Policy (IEP). The main goal of the Action Plan was to enhance students' music education through the innovative use of music technology and recording, supported by the ESPA program "Upgrade of Music Education in Music Schools" (2023-2026). Specific objectives included developing students' technical skills in recording and sound editing, fostering creativity through the production of musical works, and understanding the importance of technology in the professional music field. Implementation involves organized workshops on recording and music production, utilizing modern equipment and digital software (Cubase, Audacity, Dorico, MuseScore). The program was applied gradually, with students creating group musical projects and taking an active role in all production stages. The evaluation methodology focused mainly on a qualitative approach (interviews, observation, analysis of works). The Action Plan directly contributed to the more effective implementation of cultural programs. Key challenges involved managing resources, ensuring student engagement, and supporting teachers. The paper concludes by highlighting the prospects for the sustainable use of digital technologies in Music Schools based on the findings of this completed study.

e-mail: makisvlass@gmail.com

ABSTRACT

COVID-19 first emerged in China in December 2019. After its declaration as a global pandemic in March 2020, numerous EU member states suspended the operation of educational institutions. In Greece, the first SARS-CoV-2 case was reported in February 2020. Shortly after the ninth confirmed case, a 48-hour localized closure of educational institutions was announced for specific prefectures on March 5–6. Despite the pandemic's multifaceted negative impacts, it acted as a catalyst for strategic decisions and the acceleration of the country's digital transformation. The school closures triggered an immediate transition toward the implementation of Distance Education (DE).

This study explores the perceived benefits of DE through the lens of secondary education students. A mixed sampling method (Stratified and Cluster sampling) was employed, involving 462 Junior High and High School students from the Prefectures of Attica and the Cyclades. The research was conducted in May 2020. Data were collected via LimeSurvey and analyzed using SPSS (v.25). The methodological framework included Cronbach's Alpha reliability analysis, descriptive statistics, factor analysis, and Chi-square tests.

Findings indicate that 78.1% of students perceived minimal benefits from DE, whereas only 6.9% reported significant benefits.

Although DE supported the Greek educational system across all levels during the pandemic, the majority of secondary education students stated that they did not benefit from this mode of instruction. Their initial expectations remained unfulfilled, and they reported a failure to acquire the anticipated theoretical knowledge.

A comparative analysis of these findings with international literature reveals common challenges and disparities related to the specificities of national educational systems, technological infrastructure, and distinct cultural and economic factors.

Keywords: Distance Education, E-learning, Information and Communication Technologies (ICT), Synchronous Learning, Asynchronous Learning.Abbreviations: Simple Random Sampling (SRS), Distance Education (DE), Information and Communication Technologies (ICT).

THE FLORENTINE RENAISSANCE AND THE GREEK SCHOLARS: A CONNECTION THROUGH DIGITAL MEDIA

e-mail: iliasde@hotmail.com

ABSTRACT

This study examines the influence of Greek scholars from the Byzantine and Post-Byzantine periods, such as Chalkokondyles, Chrysoloras, and Laskaris, on the Florentine Renaissance, utilizing digital media and information and communication technologies (ICT). The aim was to highlight the pivotal contribution of these significant figures to the shaping of the intellectual landscape of the Renaissance and to explore how the transmission of Greek philosophy and ancient Greek texts influenced the development of Western thought and art. The project employed modern digital tools, including PowerPoint presentations, images, videos, and audio recordings, to create a multidimensional presentation offering a comprehensive understanding of the topic.

Guided by their teachers, the students used digital tools to develop a presentation that emphasized the connections between the classical Greek heritage and the artistic and philosophical developments of the Renaissance. Furthermore, they composed and set to music an original poem about the period, thereby deepening their engagement with the artistic and cultural dimensions of the subject and combining textual analysis with musical expression. This process helped students understand how Greek scholars, through the revival of ancient Greek texts, influenced Italian Renaissance intellectuals and artists, fostering a cultural dialogue that shaped the trajectory of Western civilization.

The students' work was presented at a student conference, where the use of digital media was combined with live student presentations. PowerPoint served as the primary presentation tool, while the students provided live explanations and interacted with the audience, elaborating on the findings of their research. This live presentation allowed the students to clarify key aspects of their work and enhance engagement with participants.

The results of our study were highly positive. Students gained a deep understanding of the Florentine Renaissance and the contribution of Greek scholars to the intellectual and cultural flourishing of the era. Additionally, they developed digital skills alongside their ability to create multidimensional presentations. The integration of music and video significantly enriched the learning process, fostering a more dynamic and impactful educational experience. The combination of theoretical analysis with modern technology offered students the opportunity to develop a cross-cultural approach to the topic, enhancing their creativity and communication skills.The abstract should include the focus of your paper, i.e., what your paper is about, a brief description of the steps or methodology used, the main findings of the paper, and its results.

Keywords: Florence, Renaissance, Byzantine Scholars, Digital and Technological Media.

EVALUATION OF AN EDUCATIONAL APPLICATION FOR ANDROID MOBILE DEVICES, FOR UNDERSTANDING 5TH GRADE PHYSICS CONCEPTS USING VOICE ASSISTANT

ABSTRACT

The present study investigates the use of mobile learning in the teaching of Physics in primary school, with particular emphasis on the concept of Heat. The theoretical framework is based on several learning theories, such as behaviorist learning theory, discovery learning theory, constructivism, and social constructivism, in order to provide a holistic explanation of students' scientific learning. The research also explores the current state of science education in Greece, highlighting students' perspectives and challenges in understanding the concept of heat. It further examines the motivations, benefits, and drawbacks of mobile learning, analyzing the principles of mobile learning design and the process of developing educational applications.

The study employs a combination of usability and effectiveness research approaches, adopting a mixed-method methodology. The usability study evaluates the degree of ease of use and engagement offered by the educational application, while the effectiveness study measures the application's impact on students' understanding of Heat. A case study approach is utilized to provide valuable insights into students' learning experiences and outcomes. The sample consists of primary school students, and data are collected through pre- and post-tests, questionnaires, and classroom observations.

Findings indicate that the use of mobile learning applications can significantly enhance students' engagement and their comprehension of physics concepts. The usability evaluation reveals high levels of satisfaction and simplicity of use, while the effectiveness evaluation demonstrates substantial improvements in information retention and students' ability to apply concepts. The study concludes with a discussion of the anticipated advantages of mobile learning, offering evidence-based recommendations for educators and policymakers to support the integration of technology into science education.

RICHARD MAYER'S MULTIMEDIA LEARNING AND THE CREATION OF EDUCATIONAL VIDEO IN CONTEMPORARY TEACHING MODELS

Zachariadi Vasiliki
Teacher of Applied Arts (8901), MSc in Public Discourse and Digital Media
4th Vocational High School
Larissa, Greece-
email: baso1010@yahoo.gr

ABSTRACT

The rapid advancement of technology has rendered educational video a key tool in teaching, enhancing learning through a variety of stimuli. According to Richard Mayer's Multimedia Learning Theory, learning becomes more effective when information is presented through audiovisual means, engaging both the visual channel (images, videos, diagrams) and the auditory channel (speech, sounds, music). This theory is based on three fundamental principles: dual processing of information, the limited capacity of working memory, and the active processing of cognitive load.
Educational video is dynamically integrated into all modern learning models, reinforcing understanding and the assimilation of knowledge. In the Flipped Classroom model, students engage with educational videos before the lesson, allowing in-person instruction to be enriched with collaborative and experiential activities. In the Blended Learning model, videos serve as a bridge between traditional and online learning, offering flexibility and personalization.

Furthermore, educational video plays a central role in Differentiated Instruction, as it can be adapted to various difficulty levels, learning preferences, and learning paces. In Inclusive Education, multimedia elements support access for students with learning difficulties, using subtitles, narration, and interactive tools. Educational videos contribute to improved comprehension and more effective lesson organization. Similarly, in Tiered Instruction, teachers create multiple versions of the same video, tailored to students' abilities.

The effective creation of educational videos requires the application of Mayer's principles, including spatial and temporal alignment of text and image, elimination of extraneous information (minimizing cognitive load), and active student engagement through questions and interactive components.

In conclusion, the use of educational video—when grounded in the principles of multimedia learning—can transform the teaching process, making it more adaptable, personalized, interactive, and effective, while enhancing students' comprehension and engagement in today's classroom.

RESEARCH CONCLUSIONS ON THE USE OF SOCIAL NETWORKING SITES BY ADOLESCENTS

Katsaros Konstantinos
Information Technology Education Consultant PE86
Directorate of Secondary Education of Aetolia-Acarnania
e-mail: katsaros74@sch.gr

ABSTRACT

This study investigates the use of social networking sites by Secondary Education students, focusing on habits, potential risks arising from their use, and possible ways to address them.

Data was collected using a questionnaire completed by 80 second-grade high school students (32 boys and 48 girls), aged 16-17, from an urban school in Lefkada. The questionnaire aimed to record habits, frequency, and manner of social network usage, identify potential risks (such as cyberbullying, data breaches, addiction), and examine whether the impact of these risks differs by gender.

Findings confirm the application of the Digital Addiction Theory (Young, 1998) concerning excessive use, the Social Learning Theory (Bandura, 1977) in platform and behavior choices, and the Risk Perception Theory (Slovic, 1987) in gender differences.

According to the results, most students use social networks daily, primarily for communication with friends/family and entertainment, and less for information. Instagram, TikTok, and Snapchat are the most popular platforms, while Facebook and X are less favored.

A significant percentage of students reported encountering risks or knowing someone close who had unpleasant experiences. Data processing highlighted that female students experience discomfort more frequently, which leads them to be more concerned about data security, unlike male students who are less cautious regarding online risks.

The study also reveals that most students have been taught basic protection methods (such as password management, privacy settings, blocking unwanted users, searching on relevant websites) but often fail to apply these practices due to negligence or other reasons.

Education on digital safety and promoting a healthy online environment are deemed essential by both educators and parents. Emphasis should also be placed on investigating the causes of gender differences observed in students' risk perceptions.

Keywords: Internet, social media, cyberbullying, safety

THE UTILIZATION OF NEW TECHNOLOGIES IN TEACHING: A STUDY IN HIGHER EDUCATION

ABSTRACT

Introduction: Using new technologies in teaching practice has reshaped the educational landscape, offering innovative tools that enhance the learning experience. Information and Communication Technologies (ICTs) enable interaction, collaboration, and access to educational resources regardless of geographical constraints. At the same time, they promote personalized learning and creativity, while supporting professors in organizing and presenting knowledge. However, their effective integration requires appropriate training, technical support, and a strategic approach to realise their full potential.

Purpose: The study examines the use of ICT in higher education, analysing the benefits, challenges, and the extent of their integration by professors. It also explores teachers' perceptions of the usefulness, challenges, and implications of ICT in teaching and learning.

Method: The study is based on two axes: the literature review and the data collection through a questionnaire. The literature provides the theoretical background for the use of ICT, while the questionnaire records the views and experiences of 62 university teachers on the integration of ICT in the educational process.

Results: The majority of university teachers (96.8%) have integrated ICT into their teaching practices, with positive perceptions of the usefulness, relevance, and safety of these technologies. However, significant barriers were highlighted, such as lack of technical support, inadequate appropriate software, and time constraints, especially for specific age groups. Despite the frequent use of basic tools such as the internet and desktop applications, more specialized tools such as interactive whiteboards and digital testing software remain unused. In addition, a strong desire for further training was recorded, focusing on advanced computer skills, internet security, and the use of Web 2.0 tools.

Discussion: The study highlights the significant contribution of ICT to improving the educational process, while at the same time highlighting the barriers that limit their full exploitation. Although university teachers recognize the value of ICT, additional support and targeted training are needed to enhance their skills. The design of training programs and the adaptation of educational policies to teachers' needs are considered necessary to optimize the integration of ICT and improve the overall educational experience.

Keywords: ICT, Teaching Practice, Training, Obstacles and Challenges.

MODEL FOR MONITORING DIETARY INTAKE, LIFESTYLE, AND PHYSICAL ACTIVITY OF PATIENTS USING INFORMATION AND COMMUNICATION TECHNOLOGIES

Biskanaki Fani,
PhD, MSc, Director of Secondary Education Administration of Preveza
Preveza,Greece
email: fani.biskan@gmail.com

Giannakou Anastasia,
PhD, MSc, Director of the 4th General Lyceum of Ioannina «AKADIMIA»
Ioannina, Greece
email: giannakougeorgiou@gmail.com

ABSTRACT

This study investigates the use of information and communication technologies (ICT) in the daily practice of nutrition-dietetics and physical education professionals, focusing on the monitoring of dietary intake and physical activity. The literature indicates that mobile applications, particularly when combined with wearable devices, constitute effective tools for promoting healthy dietary habits and enhancing individuals' adherence to recommended practices. Within this study, the most suitable application was selected from thirty available on the Play Store and App Store and implemented in an experimental procedure involving two patients, in order to evaluate its practical utility and contribution to health management. The results highlight the effectiveness of m-Health tools in monitoring and guiding individuals, while also emphasizing the need for further research with more diverse samples to investigate the long-term benefits and potential risks associated with the sustained use of these technologies. Overall, ICT provides significant opportunities for both health professionals and patients, facilitating personalized monitoring and support, improving adherence to healthy lifestyle behaviors, and enhancing overall health outcomes.

Keywords: ICT, m-Health, nutrition applications, physical activity applications

RESEARCH ON THE UTILIZATION OF INFORMATION AND COMMUNICATION TECHNOLOGIES BY SECONDARY EDUCATION TEACHERS IN THE PREFECTURE OF IOANNINA

Britsa Eleonora
ICT Teacher PE86-MEd
Directorate of Secondary Education, Ioannina, Greece
e-mail:eleonbritsa@gmail.com

ABSTRACT

The purpose of this work was the investigation of the use of Information and Communication Technologies by teachers who teach in the school units of secondary education of Ioannina's Prefecture. Through the participation of 139 teachers from different subjects on the internet filling out a relevant questionnaire dealt with issues such as: the availability of and access to logistical equipment, the rate of use of available ICT, the type of activities in which ICT are used, the type of learning and teaching material used by teachers, key factors that negatively affect the use of ICT, the participation of teachers in training activities for ICT in teaching, as well as teachers' views and attitudes on ICT during teaching and more generally within the school unit. The questionnaire data was collected in the penultimate two months of 2018. Many of the research results are in line with those of the latest European Schoolnet research. Among the most important conclusions of the research are the following: there is a failure of adequate logistical equipment for the use of ICT which is the most negative factor for using ICT in teaching and learning, there is a greater tendency in ICT utilization, teachers of Theoretical Courses create often their own digital material due to a possible lack of ready relevant material and consult more material from the school network and the school databases while at the same time learning more on a personal level for the ICT in their spare time in order to be able to cope with modern requirements, training in ICT by the staff of the school is very rare, the important role of training due to frequent engagement of teachers with the fields they have been trained on is highlighted, the most important positive contribution of the use of ICT is to strengthen students' cooperation, while radical changes are needed in schools to fully exploit ICT in teaching and learning.

Kokkoris Christos
PhD Candidate, University of Macedonia
Thessaloniki, Greece
ckokkoris@uom.edu.gr

ABSTRACT

This study examines the affective framing of the Asia Minor Catastrophe (1922) in official Greek secondary-school history textbooks through a lexicon-based sentiment analysis. A corpus of all textbook excerpts explicitly referencing Asia Minor was compiled, from which passages reflecting both political and socio-cultural dimensions were manually selected. Preprocessing was conducted in R, including lowercase conversion, tokenization, and removal of stop words. Using a Greek sentiment lexicon, polarity scores were assigned to individual tokens; raw valence sums were aggregated and normalized by passage length to facilitate robust inter-excerpt comparisons. Results indicate that textbook narratives are overwhelmingly neutral (84.2% of labels), suggesting an objective, fact-driven pedagogical approach. Negative sentiment accounts for 14.1% of labels, clustering around descriptions of conflict, displacement, and loss, thereby underscoring the catastrophic nature of these events. Positive sentiment is minimal (1.6%), appearing only in brief references to communal solidarity or reconstruction efforts. Lexicographic profiling further reveals frequent usage of terms such as *ελλάδα* (Greece), *αθήνα* (Athens), and the inclusive pronoun *μάς* (our), reflecting a collective national perspective, alongside temporal markers (*αιώνα*, *χρόνια*) that reinforce chronological structuring. These findings demonstrate that Greek history textbooks maintain scholarly neutrality, punctuated by intensified negativity in trauma-focused sections, with scant positive counterpoints. Furthermore, this study exemplifies the value of computational methods for empirically mapping affective dimensions within educational narratives and lays the groundwork for the development of culturally sensitive, domain-specific sentiment models in historical scholarship.

DEVELOPING ORIGINAL TEACHING MATERIAL FOR GERMAN AS A FOREIGN LANGUAGE USING ARTIFICIAL INTELLIGENCE SOFTWARE AND DIGITAL TOOLS

Dr. Rizopoulou Aikaterini
Substitute Teacher of German as a Foreign Language
50th Middle School of Athens
Athens, Greece
e-mail: krizopoulou@gmail.com

ABSTRACT

School textbooks for teaching and learning the German language as a foreign language in Greek public secondary schools are devoid of any accompanying audio material. This presents a particular challenge for German as a foreign language (GFL) teachers and pupils, especially in the first grade of middle school, where the language proficiency level is defined as A1- (Pre-A1), that is below the first basic language level as described in the Common European Framework of Reference for Languages (CEFR).

Although in recent years some efforts have been made by the Institute of Educational Policy (IEP) or by individual educators to create some GFL audio materials and this material is digitally available on the *Photodentro* platform of the National Repository of Educational Material, the number of audios specifically for the Pre-A1 language level remains extremely limited. In many cases, the available material either significantly exceeds the target language level or does not align with the topics covered in the school textbook.

Finding or adapting GFL listening materials and creating suitable listening activities to develop pupils' listening comprehension skills proves to be a challenging task for GFL-teachers. This paper examines whether recent advancements in Artificial Intelligence, particularly the development of Text-To-Speech and Voice-Transformation software, can help bridge this gap in teaching and learning German as a foreign language in Greek public middle schools.

Research over the past decade has shown that various Text-To-Speech software tools can support second language vocabulary learning, while also improving learners' reading skills by functioning as 'out loud readers' of individual words, phrases, or even entire texts. Additionally, empirical evidence suggests that beginner-level foreign language learners, particularly in English classes, seem to remain unaffected by the potentially unnatural prosody of audio files generated by such software.

However, the question arises as to whether Artificial Intelligence can advance foreign language listening skills beyond the phonetic reproduction of isolated written words or sentences. Specifically, this paper focuses on the question, whether such software (in this case, Murf.AI) can be used to generate GFL audio material that sounds as 'natural' as possible and exhibits human-like characteristics. Furthermore, it explores how the final audios can be made available for use — either as audio files in an online classroom (e-Class), or as audio files accompanying a video created with holistic digital and print media creation platforms (such as Canva), or, further, as audio files integrated into a gamification platform (such as Genial.ly).

As a general conclusion, it can be said that current developments in Artificial Intelligence enable the autonomous creation of fairly realistic and adaptable audio material, tailored to the linguistic and learning profile of each classroom, to support and enhance the development of listening skills in foreign language teaching and learning.

Keywords: German as a foreign language, secondary education, listening comprehension, oral comprehension, text-to-speech, foreign languages, artificial intelligence, software.

ADOLESCENTS' PERSPECTIVES ON ELECTRONIC GAMES

Elpida Christoforidou
PhD of the Department of Fine Arts and Sciences of Arts, University of Ioannina
Larissa, Greece
e-mail: mauve2310@yahoo.gr

ABSTRACT

"There are some games that teach you how to become a better person." This was the statement of a thirteen-year-old participant in of a study conducted between 2021 and 2022, which aimed to research the cultural and socio-political dimensions of engagement with electronic games within adolescent culture. One of the research objectives was to explore adolescents' views on the value of electronic games, while another question that arose was whether and to what extent electronic games shape models of action and thinking in young people.

The research, which involved adolescents aged 12-17 from the Municipality of Thessaly, was divided into two parts. In the first stage, 485 questionnaires were collected from secondary schools in the region of Thessaly, which were analyzed using SPSS. In the second stage, 42 semi-structured interviews were conducted, for which thematic analysis was carried out.

According to the results of the research, electronic games represent a modern form of entertainment for children, a space for socializing with friends, an anxiety-relieving setting, a place for learning and raising awareness about various socio-political issues, and a means of self-improvement. Additionally, for some teenagers, electronic games were evaluated as artistic creations of equal value to a film, a music piece, or even a painting. In their view, a videogame has value for various reasons, such as its aesthetic properties (graphics, story, music), the intensive work involved in its creation, its ability to fulfill various needs (entertainment, relaxation, learning, challenges, creativity, social interaction, etc.), its connection to reality, and its mentoring, such as giving lessons of survival. The element of 'survival' fascinates adolescents, and one reason for this attraction lies in the opportunity to create a society from scratch.

McGonigal (2010), a video game designer, argues that electronic games are an inventive platform for changing the world and that within the game, children become the best version of themselves, developing a social network, building confidence, and engaging in meaningful activities that bring them pleasure. Indeed, these thoughts are reinforced by the results of the present research. The world of videogames forms a second parallel world, where adolescents, as members of a group, solve problems, create and/or try to improve things and situations – something that gives meaning to their actions – and have, consciously or not, various gaming socio-political experiences that encourage them to change things for the better.

Keywords: electronic games, adolescents, value, representations.

TA4: The digital divide and emerging inequalities.

THE DIGITAL DIVIDE IN PRIMARY EDUCATION IN GREECE: CHALLENGES, EMERGING INEQUALITIES, AND INCLUSIVE PRACTICES

Maria Kastoura
Primary School Teacher (PE70)
Primary School of Nea Mesimvria, Directorate of Primary Education of Western Thessaloniki
Thessaloniki, Greece
e-mail: kastmara@yahoo.com

Georgios Margaritis
Principal, Primary School Teacher (PE70)
Primary School of Nea Mesimvria, Directorate of Primary Education of Western Thessaloniki
Thessaloniki, Greece
e-mail: gmarg43@hotmail.gr

ABSTRACT

The digitalization of education has brought to light inequalities in access to technology, digital literacy, and educational infrastructure, particularly in primary education. This study investigates the digital divide in Greek primary schools through a review of the literature, focusing on the challenges, emerging inequalities, and inclusive practices implemented to mitigate it.

The literature review reveals that access to Information and Communication Technologies (ICT) in Greek primary schools is unevenly distributed. Urban schools tend to have more technological infrastructure, while rural schools face significant shortages in equipment and connectivity. At the same time, students from low-income families often lack access to electronic devices and stable internet connections, which excludes them from modern learning practices.

Beyond basic access, the study highlights the concept of "secondary digital inequality," which refers to differences in the skills required to effectively use technology. Students from affluent families tend to develop higher levels of digital literacy, whereas students from disadvantaged backgrounds often acquire only rudimentary skills, leading to long-term educational and professional consequences.

Moreover, teacher training in ICT remains fragmented and unevenly distributed, affecting the effective integration of technological tools in teaching. The lack of cohesive educational policy and limited government funding have resulted in low ICT adoption in daily instructional practice. Although digital education programs have been introduced, their implementation is often fragmented, with many schools relying on external funding and private initiatives.

To address these challenges, inclusive practices are being developed in Greek primary education. Teacher training programs focus on enhancing digital skills, enabling the creation of interactive and inclusive learning experiences. School-based digital literacy initiatives, such as coding workshops and interactive programs, promote equitable access to technology. Additionally, community partnerships with private stakeholders provide schools with technological equipment and financial support.

Despite positive initiatives, barriers remain. The absence of a comprehensive national strategy for digital education and the reliance on external funding raise concerns about the sustainability of actions. While ICT can enhance teaching and learning, their inadequate or improper integration may further widen the gap between students.

In conclusion, the study underscores the urgent need for comprehensive strategies to bridge the digital divide. Unequal access to technology, disparities in digital literacy, and insufficient support for educators perpetuate educational inequalities. However, inclusive practices, such as targeted teacher training and school-based digital literacy programs, can foster a more equitable digital learning environment. Achieving genuine digital inclusion requires a collaborative approach involving educators, policymakers, and the wider community.

ABSTRACT

In the past decade, education worldwide has been undergoing a profound transformation due to the rapid advancement of digital technologies. Digital transformation is not limited to supporting traditional teaching methods, but fundamentally reshapes the way knowledge is acquired, shared, and experienced, as well as how educational institutions are organized and managed. The integration of innovations such as artificial intelligence, machine learning, MOOCs, and virtual classrooms has opened new pathways in learning, offering greater accessibility, personalization, and scalability.

However, this evolution comes with serious challenges. Despite the opportunities it presents, digital transformation can intensify existing social and economic inequalities, creating a new "digital divide." Unequal access to digital tools, infrastructure, and skills - especially among vulnerable social groups or remote communities - remains a major obstacle to equitable education.

This paper analyzes the dual nature of digital transformation and highlights the need for participatory, fair, and inclusive policies. It adopts the methodology of literature review and policy text analysis. It explores the key challenges in the digital transformation of education and, in its final section, proposes specific strategies—such as investing in technological infrastructure and strengthening the digital skills of students, educators, and citizens—so that technology can meaningfully contribute to reducing educational inequalities.

Keywords: digital transformation, primary and secondary education, digital gap, digital divide

DIGITAL INEQUALITIES IN THE 21ST CENTURY

Angelos Rondogiannis
ICT and Music Educator (PE86 – TE16), MSc
Ministry of Education, Greece
email: arondo@sch.gr

Dr. Amalia Plaskasoviti
German Philology Educator (PE07)
Ministry of Education, Greece
email: amaliaplaskoviti@gmail.com

ABSTRACT

This study focuses on the digital divide (digital illiteracy) and the inequalities that stem from it, particularly in relation to essential digital competencies such as internet navigation and the use of basic digital tools (e.g., word processing, email communication). In a contemporary context marked by hyper-information and rapid technological advancement, the inability of individuals to competently operate digital devices (e.g., smartphones) or utilize computers in everyday life appears incongruous and contrary to common societal expectations.

Digital illiteracy refers to the inability of individuals to effectively engage with digital technologies and to leverage the functionalities these technologies offer across key areas of daily life—work, education, communication, and social engagement. The lack of digital skills has profound socioeconomic consequences, limiting access to employment opportunities, educational advancement, and civic participation. This limitation produces tangible social and practical disadvantages, reinforcing inequality and unequal treatment across multiple dimensions of daily experience.

The present research was conducted at the 2nd Experimental Lyceum of Lefkada "Angelos Sikelianos" during the 2024–2025 academic year, within the framework of the Institute of Educational Policy's Active Citizenship Initiative. The project aimed to empower students who possessed a foundational level of digital proficiency to assist other individuals—primarily family members such as parents and grandparents—in acquiring essential digital skills (e.g., online communication, interaction with public services and financial institutions), thereby enhancing their capacity to participate meaningfully in a digital society. Simultaneously, the project sought to cultivate among students an awareness of the various forms, causes, and mechanisms underlying digital inequality, and to explore possible strategies for its mitigation (e.g., access, content creation, digital participation, infrastructure improvement, and policy design).

The methodology involved the selection of participants from diverse social backgrounds (age, gender, geographical location, socioeconomic status, educational level), the administration of structured questionnaires (online and face-to-face), individual interviews, quantitative data analysis, and comparative analysis using data from international organizations (e.g., UNESCO, Eurostat) and public data repositories. Students were actively involved throughout all phases of the research process—from goal setting and situational analysis to data collection, stakeholder engagement (public and private sector entities), and public awareness campaigns. Based on the findings, students formulated and recorded their own proposals aimed at enhancing digital literacy and reducing the digital divide.

The research underscores the critical importance of fostering digital competencies in students, given the central role of technology in modern learning environments and societal development. Bridging digital inequalities and ensuring equitable access to digital technologies and opportunities can contribute to a more inclusive, innovative, and socially cohesive society.

SCHOOL LIBRARY AS A LEARNING HUB: ACTION PLAN FOR DIGITAL UPGRADING

Giannakou Anastasia
PhD, MSc, Director of the 4th General Lyceum of Ioannina «AKADIMIA»
Ioannina Greece

Voulgari Ioanna
Teacher of Religious Studies of the 4th General Lyceum of Ioannina «AKADIMIA»
Ioannina, Greece

ABSTRACT

This paper presents the implementation of a comprehensive action plan for the modernization of the school library, aiming to foster learning, creativity, and both digital and traditional reading literacy. The initiative went beyond the renovation of the physical space, focusing instead on the creation of a multifaceted and functional learning environment that integrates digital and traditional infrastructures, advanced technological tools, and collaborative teaching practices. The project was carried out with the active participation of students, teachers, and external partners, with the overarching goal of transforming the library into a dynamic hub of knowledge, innovation, and social interaction.

The main outcomes include the development of original educational and audiovisual material, the design of interactive reading promotion programs, the establishment of partnerships with cultural and academic institutions, and the integration of the library into national and international networks for the exchange of good practices. Evaluation was conducted using a combination of quantitative and qualitative criteria, such as community participation, quality of collaboration, completion of activities, use of digital resources, and user satisfaction. The results highlighted the potential of school libraries as multidimensional learning spaces that meet the demands of the 21st century, enhance digital literacy, and function as hubs of social participation and innovation.

Keywords: Digital literacy , Information literacy, Educational digital tools, Hybrid libraries, Knowledge dissemination, Technological innovation, Sustainability of practices.

VISUALIZING LEARNING: DESIGN PRINCIPLES, IMPLEMENTATION, AND BENEFITS OF INFOGRAPHICS IN THE EDUCATIONAL LEARNING PROCESS

Ioannis N. Dimitrakopoulos,
MSc, Educator, PE82 Sector
DDE Preveza – 2nd Gymnasium of Preveza
Preveza, Greece
email: jndimit@gmail.com

ABSTRACT

This scientific article explores the contribution of infographics to the learning process by examining their design principles, pedagogical applications, and effects on students' cognitive development. Infographics combine visual and linguistic elements, offering an efficient way to organize and present complex information. In recent years, their use has significantly increased as they have proven to be particularly effective in facilitating the understanding and assimilation of both fundamental and complex concepts through structured visual data representation. According to literature, cognitive learning theory integrating multiple information channels enhances memory recall and promotes a deeper understanding of concepts.

Following a primary methodological approach of literature review, the article analyzes their usage in education as well as the challenges arising from their use. Through systematic analysis of research data and theoretical perspectives, the article highlights their contribution to the learning process. Alongside, it notes potential difficulties that emerge from their use, underscoring that an overly large amount of information without necessary guidance may cause cognitive overload, adversely affecting information processing and assimilation.

Particular emphasis in the publication is placed on the use of infographics across interdisciplinary fields (natural sciences, language education, social sciences, etc.) and their significance as a tool for development, creation, and application through the use of specialized methodological tools such as Napkin and Venngage platforms. The case studies developed provide specific and measurable data on how visual graphics can support teaching, enhance understanding of concepts, and improve the learning experience.

The immediate goal of the research is to highlight the educational significance of infographics in both informal and formal educational environments. Their ability to transform complex information into comprehensible visual formats enhances cognitive engagement, inclusive learning, and reflective thinking through visual and digital literacy. Students' participation in their creation strengthens skills such as data analysis, communication, and collaboration.

The paper is directed towards the entire educational community and also challenges educators to develop imagination and creativity, aiming for a modern, structured, and technologically informed practice

THE IMPLEMENTATION OF MULTIMODALITY IN LANGUAGE TEACHING: A SYSTEMATIC LITERATURE REVIEW

Mavraganis Vasileios
Educator / Teacher PE70 & PE02,
PhD Candidate, Department of Educational Sciences and Early Childhood Education (TEEAPH)
University of Patras
Patras, Greece
email: vmavragan@gmail.com

ABSTRACT

Multimodality is considered an innovative approach in the field of education, as it integrates a variety ofsemiotic resources with the aim of enhancing learning and comprehension. It offers a more comprehensive learning experience by allowing students to engage with educational content through multiple and diverse modes of representation. This approach goes beyond written text to include visual and digital forms, which are integral elements of the contemporary world. Through multimodality, students are able to develop a deeper understanding of concepts, improve their language skills, and foster critical thinking and creativity.The aim of this study is to explore the implementation of multimodality in language teaching within primary education, emphasizing its impact on both students and educators. The research is based on a systematic review of the literature, drawing from primary sources. A total of 33 qualitative, quantitative, and mixed-method studies were selected, written in either Greek or English and published between 2000 and 2025. Keywords used in the database searches were directly related to the title and content of the research. Studies were excluded if they were not relevant to the research topic, lacked a clearly defined sample, involved a limited sample size, or did not include qualitative or quantitative data. The findings highlight the positive influence of multimodality on language instruction in primary education. The use of multimodal texts and interactive tools significantly contributes to the improvement of students' reading abilities, allowing information to be presented in diverse ways that support comprehension, memory, and knowledge retention. Students exposed to multimodal content exhibit greater engagement and interest in language learning while also developing their critical thinking skills through information synthesis and analysis. Furthermore, incorporating multimodal elements into textbooks—such as images, interactive stories, and educational software—has been shown to strengthen students' connection with language content, making learning more appealing, accessible, and effective.However, the study also identifies certain challenges in applying multimodality. Many educators lack adequate training in the use of multimodal tools and software, which hinders effective implementation in the classroom. Additionally, infrastructure limitations, restricted access to modern technological resources, and time constraints often pose barriers to integrating multimodal activities. Nonetheless, ongoing technological advancements and emerging educational policies suggest that multimodality is gaining traction and is expected to play an increasingly important role in future language education. The development of targeted training programs for teachers, the integration of multimodal strategies into instructional practice, and the improvement of multimodal educational software are considered essential steps toward the effective implementation of this approach in primary education.

Keywords: Multimodality, language teaching, primary education.

MULTILITERACIES IN SCHOOL EDUCATION: UTILIZING DIGITAL CONCEPT MAPPING ENVIRONMENTS

Totolou Angeliki
Teacher, Sociologist

ABSTRACT

This article refers to diagrammatic representations of knowledge with a particular focus on concept mapping. In the digital era, learning environments are undergoing significant transformations in response to emerging challenges. The learning process is freed from spatial and temporal constraints and is constantly evolving with the ultimate goal of upgrading the learning experience. Undoubtedly, interactivity is a central issue and a requirement at the same time. Under these conditions, the concept of multiliteracies acquires renewed dimensions and perspectives. Starting from the utilization of concept mapping in teaching and learning, the benefits of this approach will be mentioned. Concept mapping is applied across various subject areas. In this case, the field of application is drawn from the course of Social and Political Education, which encompasses a wide range of topics and concepts. Emphasis is placed on promoting meaningful learning. Furthermore, the potential uses of concept mapping are analyzed in relation to information processing and synthesis, the development of ideas and concepts, the acquisition of new knowledge, and the cultivation of critical thinking and creativity. It is worth mentioning that concept mapping enables the visualization of relationships between concepts, which contributes to an in-depth understanding of the subject. As a result, concept mapping emerges as an educational strategy that can promote innovative educational designs in digital learning environments.

Keywords: multiliteracies, multimodality, concept mapping, digital media.

ARTIFICIAL INTELLIGENCE AND ETHICS: CHALLENGES AND SOLUTIONS

Samonas Konstantinos
Teacher of Greek Language and Literature
Directorate of Secondary Education of Preveza, Gymnasio Lourou
Preveza, Greece
e-mail: samkon@sch.gr

ABSTRACT

In this article we focus on the theme of Digital Ethics, particularly in the field of Ethics in Artificial Intelligence (AI) and the challenges arising from its introduction into education. It begins with a presentation of the term AI. Then, it explores the ways AI has been integrated into education and the potential benefits it can bring to areas such as administration and management, teaching and learning—such as personalized learning, the creation of high-quality pedagogical content tailored to students' needs, timely and accurate assessment and feedback, as well as predictive interventions for students facing difficulties. Next, the article highlights the most significant challenges related to the introduction and use of AI in education, such as privacy, data protection, algorithmic bias and opacity, the digital divide, plagiarism, and broader risks to academic integrity. It then presents the ethical frameworks of deontology, utilitarianism, and virtue ethics, and examines existing codes of ethics—particularly those issued by international and transnational institutions such as UNICEF, the OECD, and the European Union—as well as the legal framework developed within the EU (e.g., the GDPR and the AI Act). The analysis reveals that ethical codes often fail to produce the desired outcomes due to various factors, such as corporate or national competition and the dependency of scientific advancement on funding from investors who may have self-serving interests. This underscores the need for stronger institutional safeguards. Finally, in the article is mentioned the role of schools in cultivating not only the knowledge and skills necessary for the creative use of AI, but also a moral conscience in its application by students as future adults. This is crucial in mitigating harmful practices and outcomes for society. It also stresses the need for teacher training in these areas so that educators can serve as role models for their students.

Patras, Greece

ABSTRACT

This study examines the concept of active citizenship in the modern digital world, focusing on the crucial role of education in shaping active, responsible and critically thinking students-citizens. Through theoretical and conceptual analysis, the transformations of citizenship in the light of digitalization, globalization and multiculturalism are explored, as well as the emergence of digital citizenship as a key dimension of modern democratic participation. Particular emphasis is placed on the connection of digital citizenship with digital intelligence, which includes cognitive, social, emotional and ethical skills necessary for safe and responsible participation in the digital public space. The study shows that education must go beyond the simple cultivation of technical skills and adopt a holistic approach, which fosters critical thinking, digital ethics and active participation. In conclusion, digital citizenship education is a key prerequisite for strengthening democracy and building an inclusive and responsible digital society**Λέξεις-κλειδιά:** ενεργός πολιτειότητα, ψηφιακός πολίτης, ψηφιακή νοημοσύνη εκπαίδευση ψηφιακού πολίτη.

ABSTRACT

The article has to do with a teaching scenario in Chemistry, aiming to mobilize and reflect on issues of pseudoscience or misleading the public, on scientific issues in a digital world full of information overload, challenges and deceptions. Based on the discovery-investigation and collaborative group method, using modern digital tools, the teaching scenario has its main goal the education of active and concerned students-digital citizens on issues of science and scientific deception. It can serve as a guide to be adapted to other Science subjects such as Biology and Physics, serving corresponding teaching objectives for students in the 3rd year of middle school and high school classes.

Keywords: science, scientific deception, natural sciences, pseudoscience, digital citizen

ABSTRACT

The education of students with visual impairments is a complex and dynamically evolving field, requiring specialized approaches to ensure effective learning, inclusion, and empowerment. Efforts to integrate students with visual impairments into regular educational environments have gained momentum. Research highlights the importance of accessibility in both the physical and digital.

Multimodality in learning refers to the fact that student's process knowledge through different sensory channels. In the case of students with visual impairments, the auditory channel takes on a leading role, as it functions as the primary means of receiving and organizing information. Furthermore, according to constructivism, learning is not a passive process but an active construction of knowledge through interaction with the environment. Digital audio tools enable students with visual impairments to interact with educational materials, explore concepts, and construct knowledge through auditory and sensory experience.

The use of digital technologies in teaching students with visual impairments has made a significant contribution to improving their access to knowledge. Audio-based tools allow for the understanding of mathematical and other scientific concepts through auditory information. Text-to-speech (TTS) software, audio labels, and interactive applications with audio guidance enhance student autonomy, while audio diagrams and descriptive narratives facilitate the absorption of complex information. In addition, touch technologies combined with audio feedback provide multisensory support, facilitating the learning process. The use of these tools promotes inclusive education, allowing the active participation of students with visual impairments in the classroom and enhancing their learning experience.

In this paper, modern audio tools that enhance the learning process are examined, with an emphasis on teaching mathematical and scientific concepts. Tools that are currently in circulation are presented and special reference is made to those that can be obtained by students and teachers for free. For the practical investigation of the effectiveness of these tools, a case study was carried out and presented. The student of the 3rd grade of the F.D. high school with partial vision loss participated in a program of enhanced mathematical teaching using digital tools. The educational approach includes the use of NVDA software for reading mathematical symbols, Desmos for audio feedback for function graphs, interactive touch applications for understanding geometric shapes, and the integration of audio descriptions into interactive learning environments. The results demonstrate improved student understanding and engagement, highlighting the importance of integrating adaptive learning technologies.

DIGITAL HIVES ON E-ME FOR TEACHING GREEK TO REFUGEE CHILDREN: ENHANCING INCLUSIVE EDUCATION THROUGH CONNECTIVISM AND GAMIFICATION

Despina Zeka-Paschou
Educator, Primary Education (PE 70),
Ministry of Education, Religious Affairs and Sports (YPAITHA)
Principal of Nea Kerasounta Primary School
Preveza, Greece
e-mail: despozeka@yahoo.gr

ABSTRACT

The integration of refugee children into the Greek educational system requires flexible and innovative approaches that incorporate digital tools and interactive learning methods. While attending face-to-face lessons remains our primary goal, students' frequent absences due to social and family factors create learning gaps. To address these challenges and leverage the digital tools provided by the Panhellenic School Network, a digital Hive was created on the e-me platform, based on Connectivism and Gamification theories as means to enhance inclusive education.

In the e-me Hive, refugee students can access educational material continuously, participate in interactive activities, communicate with their teachers, and collaborate with their classmates. At the same time, the platform facilitates parental involvement in the learning process, creating a digital educational ecosystem that transcends the boundaries of the physical classroom. Gamification is utilized through interactive quizzes, games, and challenges, which increase student engagement and motivation. These activities, tailored to the linguistic needs of refugee children, enable them to learn Greek in an enjoyable manner. Additionally, continuous feedback and self-assessment opportunities within the platform enhance students' active participation and autonomy.

Through interactive vocabulary and grammar exercises tailored to students' language proficiency levels, audiovisual materials, available digital dictionaries in languages such as Farsi and Arabic, and gamification-based activities such as quizzes and games, the platform serves as a communication tool that facilitates interaction between students, educators, and parents. Furthermore, it may also function as a language learning tool for the parents of refugee students.

The initial results indicate increased student engagement, as the digital and gamified environment makes learning more attractive. There is also an improvement in linguistic development, thanks to the multimodal approach and access to personalized learning materials. Additionally, the platform enhances students' exposure to the Greek language, even outside of school settings.

This presentation showcases how the e-me platform, through the creation of specialized Hives, functions as a dynamic tool for digital and inclusive education. The integration of Connectivism and Gamification creates an engaging, interactive, and participatory learning environment, enhancing the linguistic and social inclusion of refugee children, making learning more flexible, accessible, and interactive.

ABSTRACT

In the Greek educational reality, the transition to the new paradigm of the school for all students often appears to be hindered by terminology issues. The central focus of these obstacles is the undifferentiated rendering of the term “inclusion”. The term “inclusion”, which is a central influential concept of the new paradigm, in the Greek literature is rendered with terms such as: /ensomatosi/, /entaxi/, /symperilipsi/, /synekpaedefsi/, etc., a condition that makes communication on relevant issues difficult and often leads to a dead end for practitioners and researchers in the field. Considering the rapid developments related to the ability to access the internet via fixed and mobile devices and the emergence and spread of Artificial Intelligence (AI) in society, work and education, the educational community shows increased interest in Information and Communication Technologies (ICT) in the school/teaching context. Taking into account: (a) the systematic ranking of our country below the international average of the countries participating in the Programme for International Student Assessment (PISA), (b) the digital divide and (c) the trend of enhancing the utilization of information, services, entertainment and social interaction offered by ICT and AI, the necessary prerequisites for the implementation of material and digital design in school for all students are examined, with emphasis on the meaning of the term "inclusion". The results of our bibliographic research are presented synthetically and critically commented. The paper concludes with a discussion and relevant proposals/recommendations. The clarification of the polysemy of the term "inclusion" is proposed to be realized through a four-level/stage approach, which holistically defines and analytically describes the school for all students, both in its material and digitally supported version. On the way to 2030, the new reality makes it urgent to prioritize the transition towards education/school for all students, by ensuring adequate guarantees/resources, so that... no student is left behind. Through the effort to design and implement the new paradigm, guarantees are being claimed for the integration into the guidelines of national curricula and teacher training programs of new educational institutions, such as the Center for Applied Special Technology (CAST) in the USA, which, with centralized design and experimental implementation, will be able to support the transition to the new paradigm with options for reasonable use of technology, formative/final evaluation of the necessary services and, necessarily, reflection towards improving the new revised paradigm.

Keywords: Special/Inclusive Education, inclusion, Information and Communication Technologies, Digital Divide, Artificial Intelligence, CAST, PISA.

TEACHING GREEK IN THE INTERCULTURAL CLASSROOM USING THE DIGITAL LANGUAGE LEARNING TOOL "AKELIUS LANGUAGES"

Stavroula Kalaitzidou
Primary school teacher
32nd Athens primary school
Athens, Greece
e-mail: sk8720@windowslive.com

ABSTRACT

The non-profit organization Akelius was founded in 2007 by Roger Akelius, a Swede businessman interested in mathematics, programming and engineering. Apart from charity, helping children in need and providing refuges with medical treatment, the foundation also deals with educational issues through the digital platform "Akelius languages", which was launched in 2018. The platform is being developed by sixty programmers in Berlin, Germany and Nicosia, Cyprus, with the cooperation of UNICEF foundation. "Akelius Languages" is an app that provides an effective method to learn foreign languages, focusing in oral and reading comprehension. With this digital tool, students between 6-18 years old are given the opportunity to learn the Greek language in a faster and more playful way, while they also gain confidence and adapt more easily to the school environment. So far, the platform is available in English, French, German, Greek, Italian, Portugese, Russian, Spanish and Swedish, while it is being used in twelve countries, Albania, Greece, Italy, Poland, Mexico, Bhutan, Bosnia and Herzegovina, Lebanon, Kazakhstan, Mauritania, Cape Verde and Sao Tome/ Principe. It contains language exercises and quiz, songs, crosswords and bingo games, grammar theory, while, as it is still in the process of developing, it is gradually being enriched with mathematics, art and history activities.

According to UNICEF data, it is already used by more than 10,500 refugee children in Greece. To date, approximately 1,600 teachers in public schools and non-formal education centers have been trained in the use of the platform. In particular, in Greek public schools it has been integrated into reception classes (ZEP) but also into general classes, in primary and secondary education, when the student population consists mainly of students with an immigrant and refugee background. The way in which the platform activities will be combined with teaching is the responsibility of the teacher, as there are no ready-made lesson plans. Lesson design is left to the flexibility and creativity of the teacher. Students enter the platform using their personal tablets and headphones, and engage in the activity assigned to them, depending on the content of the day's lesson. The hardware equipment is provided by the Akelius program and is kept in each classroom, as well as provision for internet connection and printed teaching materials. The use of the Akelius application is free, there is no subscription or advertising messages. The platform works both offline and online, but an internet connection is preferable, as students can create their own personal account and monitor their progress.

The benefits of using such a platform are multiple, as the lesson becomes interactive and personalized, as students progress at their own pace, while the teacher can give more selective attention to specific students. Regarding learning outcomes, research conducted by UNICEF in Akelius classes compared to classes with the same student population, but without the use of the platform, demonstrates that there was an 8% improvement in listening comprehension, 9% in reading ability, 25% in oral expression and 34% in written language. Qualitative research has shown that by using the platform, students gained self-confidence, motivation for learning, collaboration and consistency in their presence at school. At the same time, there are benefits for teachers as well, in an era where the use of digital media and new technologies in teaching is now required. This type of blended teaching develops teachers' digital skills, contributing to a more organized and structured lesson. I have personally joined the program and am using the Akelius platform in teaching my class during the school years 2023-2024 (1st grade of elementary school) and 2024-2025 (2nd grade) with students who are entirely foreign speakers. The school is located in the center of Athens and the student population is largely refugee/immigrant. This school, along with the Athens Intercultural Education High School, are the only schools in Greece that piloted the online program for the first time during the 2023-2024 school year.

ABSTRACT

This paper explores Inclusive Education for students with Autism Spectrum Disorder (ASD) through the use of digital tools, with a particular focus on the TEACCH educational program. The main objective is to investigate the challenges faced by students with ASD in the educational system and to evaluate the contribution of digital tools in enhancing their learning experience.

The methodology employed is based on a literature review and the collection of qualitative data through discussions with experts in the education of individuals with ASD. The study examines the fundamental difficulties these students face, the structure and implementation of the TEACCH program, and the role of digital technologies in teaching.

The research findings highlight that structured educational approaches, such as TEACCH, when combined with digital tools, facilitate the learning process and promote the social inclusion of students with ASD. Specifically, applying these methods in the teaching of Robotics and Natural Sciences shows that the use of visualization and clear activity structure improves students' understanding and autonomy.

The study underscores the importance of structured approaches in the education of students with ASD, as they support communication, social interaction, and behavior. Technology plays a vital role in personalized learning and social integration, with educators being key to the effective implementation of programs like TEACCH and the use of digital tools.

In Natural Sciences, students with ASD benefit from clear, visual instructions during experiments and lab activities, while in Robotics, visual diagrams support assembly and programming. The consistent use of visual tools across both subject areas enhances the learning experience and facilitates knowledge generalization.

In conclusion, the integration of the TEACCH program with the capabilities offered by digital media represents an effective approach to enhancing the educational experience of students with ASD. Technology enables personalized instruction, fosters collaboration among all stakeholders (educators, parents, specialists), and eases students' transitions between various academic domains. Moreover, it allows children with ASD to actively participate and comprehend complex concepts through a structured digital or in-person approach. The TEACCH program is further complemented and enriched within the classroom and extended into the child's daily life through initiatives such as EarlyBird and Cygnet.

ABSTRACT

This paper aims to highlight the effectiveness of the use of WebQuests as an Inquiry-Based teaching approach aligned with the principles of Inclusive Digital Education. The exploration and implementation of this method took place within the framework of the Erasmus+ project "Mediterranean Diet for Overall Health" (MedDiet4Health), which is an approved Erasmus+ KA210 initiative involving two Vocational schools in Greece (in the field of Agriculture, Food and Environment), one General Secondary School in Slovakia and a non-governmental organization (NGO) in Turkey.

This 18-month project aimed at designing a three-modules digital course that integrates the Mediterranean Diet into daily teaching practice. The course supports the Sustainable Development Goals (SDGs), with a particular emphasis on target 4.7 and the goals 2, 12, 14, 15 and 17, contributing to the development of learners' knowledge and skills for the promotion of sustainable development and lifestyles, cultural diversity awareness and the role of culture in sustainability.

Within this context, 60 WebQuests were developed, implemented by pilot students and redesigned in alignment with the principles of Inclusive Digital Education. These WebQuests explore the Mediterranean Diet both as an element of cultural heritage and as a sustainable, healthy dietary model, encouraging commitment to its values. Additionally, 20 more WebQuests were created to support the celebration of international awareness days connected to the project themes.

The paper presents the theoretical framework, the stages of development and implementation and the assessment tools used. It also offers a reflective analysis of the teaching practices applied during the project and presents the outcomes achieved.

ABSTRACT

Inclusive digital education constitutes a central pillar of contemporary educational practice, aiming to ensure equitable access to knowledge for all learners, regardless of social or geographical limitations (Ainscow, 2020). Within this framework, the use of digital tools for teaching vulnerable social groups -such as inmates in Correctional Facilities- is of particular significance. The research project "*Museum Tours for Inmates - the ancient Greek encounters*" (*MuTourIn*), funded by a Fellowship from the Center for Hellenic Studies at Harvard University, represents an innovative initiative that makes the most out of cultural heritage and digital technology to support the education and social inclusion of incarcerated individuals.

MuTourIn is a continuation and evolution of the successful project "*Museum Whispers in the Panopticon*," which made the most out of digital platforms to deliver digital museum tours from around the world. This new endeavor focused specifically on connecting the ancient Greek cultural heritage with the correctional education. Through the combination of digital tours and interactive discussions, MuTourIn aimed to foster cognitive development, cultural understanding, and the cultivation of 21st-century skills such as critical thinking and communication (Kidd, 2019). This initiative highlights the potential of digital cultural heritage as a tool for education and social integration, bridging the gap between incarcerated populations and the broader cultural and academic spheres, while also enhancing access to learning and promoting skills such as collaboration and intercultural awareness.

Moreover, the integration of cultural heritage into the education of inmates offers multiple benefits, as it reinforces lifelong learning and builds bridges between museums and the Second Chance Schools operating within Correctional Institutions (Watkins and Mortimore, 2022). Although existing research has emphasized the positive impact of art and education on the reintegration process, the combination of museums, classical studies, and correctional settings remains a relatively unexplored field (McGregor, 2020).

The challenges encountered during the project concerned technological infrastructure, pedagogical approaches, and the need for institutional support to ensure the sustainable development of such initiatives. Nevertheless, *MuTourIn* - through qualitative data which was derived from interviews with inmates in 7 out of the 12 Second Chance Schools operating in Greek Correctional Facilities who participated in the digital museum tours- provides valuable insights that can be utilized to design sustainable strategies combining the digital cultural heritage with social inclusion.

In conclusion, the use of digital museum tours and the pedagogical application of cultural heritage form new horizons for inclusive education. MuTourIn has demonstrated that technology can serve as a bridge across social divisions, advancing both education and social transformation through engagement with culture.

TA9: The sustainable digital school

THE SUSTAINABLE DIGITAL SCHOOL: A MODEL OF EDUCATION FOR THE 21ST CENTURY

Gounari Nektaria,
EL.E.ET.P.E.A
Philologist, 1st General Lyceum of Salamina,
email: ngounari@yahoo.gr

ABSTRACT

The digitization of education and the need for sustainability constitute two critical pillars for the development of a modern educational model. This article proposes the "Sustainable Digital School" model, which integrates technology with sustainability principles to promote a holistic, inclusive and environmentally responsible education. Through theoretical analysis and the presentation of practical applications, the article explores how the incorporation of digital tools, education on climate change, and participatory learning can create a sustainable educational environment for the 21st century.

Keywords: Sustainability, digital education, sustainable school, technology in education, 21st century.

EDUCATION AND ENTERPRENEURSHIP IN THE AGE OF DIGITAL TRANSFORMATION

Dr. Cleopatra N. Vasiliou
Director of the Directorate of Primary Education of Arta

ABSTRACT

Technological developments in the field of entrepreneurship are rapid as a result of the digital transformation of the economy. Modern schools are called upon to adapt their teaching and general educational strategies within the framework of the operation of the sustainable school. In addition, entrepreneurship is an essential and necessary skill for tomorrow's citizens and benefits both their personal and professional development. Entrepreneurship education plays a key role in a country's competitiveness and the sustainable development of its economy and competitiveness. Promoting entrepreneurship in education encourages and guides students to develop an entrepreneurial spirit and shape innovative solutions. The basic idea is for students to understand basic financial concepts, such as money management, which is part of financial literacy and entrepreneurship, and to acquire skills to create their own digital business. The philosophy of a learning organization, like a school, is to learn how to learn. Students are trained to work in groups, to submit ideas and suggestions based on interests and to conceive business ideas which, through collaboration and teamwork, through the design and simulation of a simple and standard business plan that will lead to the implementation of their The purpose of this research is the literature review and secondary analysis of data and literature, through the processing of existing research and statistics related to the developments in the application of entrepreneurship in education within the context of digital governance and the recording of good practices in the field. The original idea with the use of modern innovative digital tools. thematic Create and Innovate-Creative thinking and initiative, in the field of entrepreneurship, both domestically and internationally. The research text aims to highlight the challenges that arise for schools in the era of digital governance in the field of entrepreneurship and the implementation of active citizenship through strengthening actions in combination with skills workshops.

Keywords: entrepreneurship, education, creative thinking, digital environments

THE GREEN, DIGITAL NEIGHBORHOOD OF KINDERGARTEN

Tsingerlioti Anna
Kindergarten Teacher
M.Ed. in Mathematics Education, University of Western Macedonia
33rd Kindergarten of Evosmos
e-mail: atsiggerlioti@gmail.com

ABSTRACT

This paper focuses on the participation of the 33rd Kindergarten of Evosmos in the educational program "Green Neighborhoods," implemented by the Directorate of Primary Education of Western Thessaloniki through the Environmental Education Coordinator, in collaboration with NOUS, the Institute of Digital Learning and Communication. The aim of the program is to raise students' awareness of the need to preserve and protect greenery in their immediate environment and neighborhood, and to promote their engagement in actions intended to improve the environment and enhance their quality of life. The paper presents the steps followed in implementing the program, utilizing digital tools such as Google Earth to create a collaborative digital map in which students depict their ideal neighborhood in terms of green spaces. Through inquiry-based learning and participation in playful activities, students are encouraged to develop initiative, responsibility, and action regarding their school environment. By collecting evidence from field studies, children become more sensitized and make informed decisions about the broader conditions of their neighborhood.

Emphasis is placed on the opportunities that digital tools provide for enriching the learning experience and facilitating communication among students, while also highlighting the need for a critical approach to their use. Students become familiar with digital tools and media, share their ideas with other schools, and exchange real-life experiences. At the same time, the learning experience is enhanced, and children's holistic development is supported, as they are given opportunities to develop digital skills and responsible attitudes toward technology use.

The program was implemented within the framework of transforming the kindergarten into a sustainable school, adopting a holistic approach aligned with the values of sustainability in pedagogical, social, and environmental domains.The abstract should include the focus of your paper, i.e., what your paper is about, a brief description of the steps or methodology used, the main findings of the paper, and its results.

Keywords: digital map, sustainable school, kindergarten

TA10: Best practices in the pedagogical use of digital technologies.

A NEW APPROACH TO TEACHING NEW TECHNOLOGIES BASED ON FI AND FD COGNITIVE STYLES

Maria Chatzikyrkou
International Hellenic University
Thessaloniki, Greece
e-mail: maria.chatzikyrkou@gmail.com

Apostolos Tsagaris
International Hellenic University
Thessaloniki, Greece
e-mail: tsagaris@gmail.com

ABSTRACT

This proposal aims to highlight a new approach for the effective teaching of Robotics and New Technologies. To ensure a successful process, it is proposed to diagnose the learning styles of the learners and then to provide differentiated teaching that will achieve the intended inclusion and maximize learning outcomes. For this reason, the most well-known bipolar contrast regarding cognitive learning styles will be used, the one proposed by Witkin and his colleagues (1977) and distinguishes learners into two bipolar categories, namely those who learn without depending on their environment (Field-Independent Learners = FI) and those who make learning directly dependent on their environment (Field-Dependent Learners = FD).

Witkin and his colleagues' research led to the creation of a diagnostic tool, the Group Embedded Figures Test (GEFT), which measures the presence of the bipolar FI/FD characteristics in learners, and defines which of them tend towards the first and which towards the second category. Related research has shown that FI learners prefer to learn better by utilizing traditional means compared to learners belonging to the FD category. The latter are more influenced by their social environment than by their personal motivations, as well as by praise and criticism compared to FIs, who are more productive and egocentric, solve problems through intuition and utilize "true-false" testing strategies.

The different Cognitive Learning Style that each student possesses is part of the fundamental assumption that each child is unique, which means in simple words, various differences in cognitive and social development between children. Given that these characteristics affect learning, the field of Differentiated Teaching is considered one of the most appropriate educational approaches to manage all forms of diversity in the modern classroom, which aims to offer learning for each child individually, taking into account their particularities in the construction of knowledge and teaching. Therefore, Differentiated Teaching is a modern, child-centered and promising approach that includes many innovative approaches and at the same time a challenge for researchers and educators.

Teaching new technologies on the other hand is essential to prepare students for the future, develop their skills and create a digitally literate and innovative society. Living in a digital age, where technology permeates every aspect of life, students need digital skills to succeed in education, work and society and to equip themselves with the necessary knowledge and skills to meet the demands of the 21st century. After all, new technologies offer tools and platforms that encourage critical thinking, analysis and problem solving so that students learn to evaluate information, make decisions and create innovative solutions. Finally, teaching new technologies helps students develop digital literacy, that is, the ability to use technology responsibly, safely and ethically and to protect their privacy, recognize misinformation and avoid the dangers of the internet. In summary, this proposal analyzes the components of two learning styles, those who learn dependently on their environment and those who learn independently. Then, the method of planning activities based on differentiated teaching is explained so that the learning process is effective.

Keywords: Field-Independent Learners, Field-Dependent Learners, Cognitive Learning Style

THE USE OF THE INTERNET IN LANGUAGE EDUCATION IN THE 3RD GRADE OF THE GREEK SENIOR HIGH SCHOOL (LYCEUM)

Gkaravelas Konstantinos
Assistant Professor, Department of Philosophy,
University of Ioannina

e-mail: kgkaravelas@uoi.gr

Christou Theophano
Postdoctoral Researcher, Linguistics Division, Department of Philology,
University of Ioannina
Ioannina, Greece
e-mail: t.christou@uoi.gr

ABSTRACT

This paper presents a teaching proposal developed in the context of language education for third grade students in the Greek senior high school (Lyceum) on the topic of gender-based violence, considering the requirements of the new curriculum for language education in the Greek senior high school (Lyceum). The project is based on the use of Information and Communication Technologies (ICT) in language education and is implemented through a WebQuest structured according to the model proposed by Dodge (1995). The purpose of WebQuest is to familiarize students with authentic language material and to work collaboratively and creatively on a topic that is familiar to them and sparks their interest. The first section provides a theoretical introduction to the use of the Internet in language teaching, followed by a brief explanation of the term "WebQuests" and a presentation of the six phases of this teaching proposal.

ARCHITECTURAL DESIGN AND DEVELOPMENT OF BRAILLE TRANSCRIPTION AND LEARNING SOFTWARE

Angelis Alexandros
PhD candidate University of Ioannina
Department of Informatics & Telecommunications, University of Ioannina
Arta, Greece
email: a.angelis@uoi.gr

Angeli Kalliopi
Master's Program in Data Science, Statistics and Decision Analysis
Stockholm University
Stockholm, Sweden
email: kalligeli01@gmail.com

ABSTRACT

This paper deals with the architectural design and development of a Braille code transcription and learning software, with the aim of enhancing accessibility for people with visual impairments. The software supports the transcription of Greek and English texts into Braille and at the same time offers an easy-to-use learning environment for the code. The methodology is based on the Flat Architecture, which includes: (a) the User Layer, where the user enters the text, (b) the Business Logic Layer, where the language recognition and transcription algorithms are implemented, (c) the Data Layer, using character mapping tables. The main findings of the paper are the development of an accurate and efficient transcription tool, the user-friendliness of the interface, as well as the possibility of future scalability. The final product contributes substantially to the educational and social integration of people with visual impairments, offering a modern tool for everyday use.

The learning and transcription algorithms include character validity checking, language recognition, special symbol management, and accurate Braille mapping. The interface is designed based on accessibility and universal design principles for seamless use by people with visual impairments.

The evaluation of the system demonstrated high transcription accuracy, fast response and positive feedback from users and educators, while future extensions are proposed such as support for mathematical Braille, integration of voice output and interfacing with Braille display devices.

The work significantly contributes to the promotion of educational equity and social inclusion through innovative accessibility technologies.

Keywords: Software Architecture, Braille Code, Accessibility, Text Transcription, Computer-Assisted Learning, Flat Architecture.

"INTERNATIONAL JOINT CLASSES": A CASE STUDY ON THE INTEGRATION OF DIGITAL TECHNOLOGIES IN AN INTERNATIONAL SCHOOL COLLABORATION

Antoniou Aikaterini
Educator in Nursing and Agricultural Sciences, School Principal
Day Junior High School of Neochori, Directorate of Secondary Education of Arta, Greece
e-mail: katerinaaaant@gmail.com

Griva Eleftheria
Philologist in Special Education and School Life Counselor
Day Junior High School of Neochori, Directorate of Secondary Education of Arta, Greece
e-mail: elgriva@yahoo.gr

ABSTRACT

In this paper, we present a best practice for the use of digital technologies, as implemented within the framework of the program entitled "International Joint Classes," organized by the Metropolitan Office of Education of the Republic of Korea. The program utilized communication and distance learning technologies with the aim of fostering a deeper understanding of cultural diversity and enhancing communication skills. This international, inter-school, and collaborative project involved three schools—namely, the Day Junior High and Senior High School of Neochori in Arta, Greece, and Yang Chung Middle School in Seoul, South Korea—and was an initiative of the Greek school. The program was conducted from May to December 2024. The selected topic was "World War II and its Impact on the Two Nations." The project included both synchronous online meetings and asynchronous remote teaching sessions using the materials produced by the students.

The first part of this paper highlights the significance of modern digital tools in education and teaching. The rapid development of digital and technological media has brought about substantial changes in the learning process, creating new opportunities and challenges for the educational community. Therefore, it is deemed essential to leverage and evaluate these tools in contemporary educational settings by examining their potential and contribution to enhancing teaching practices. In the second part, we present our school's contributions and the digital tools employed in the aforementioned program. These tools facilitated the creation of a dynamic online learning community that promoted collaboration and interaction through the exchange of information, historical sources, and viewpoints regarding the events of World War II. It is noteworthy that all project work was conducted in English. The main digital tools used to support interactivity and a multimodal approach to learning included:

- Padlet – A user-friendly, interactive platform for collaborative learning. It functions as a virtual bulletin board where content and multimedia (documents, images, videos, audio, etc.) can be posted and accessed at any time. It was selected as the common platform for posting group assignments by students from all three schools.
- Veed – A simple video editing tool. This was chosen by one student group to convert a PowerPoint presentation into a video, introducing team members and their local area.
- Canva – A versatile design platform that enables the creation of a wide range of interactive multimedia content, including infographics, posters, presentations, worksheets, and comics. This tool was chosen by one group to design a poster on the 1943 Kommeno Massacre in Arta.
- Prezi – A multimedia presentation software. This intuitive application requires no prior design or programming experience. One student group used it to create an engaging presentation on key dates and significant events of World War II in Greece. Another group, addressing the same topic, created a historical timeline using the Preceden tool.
- Vocaroo – A very simple audio recording tool that generates mp3 files. This was selected by students to record key terms related to World War II.

The third part presents the conclusions and evaluation of this experience, which highlighted the positive contribution of digital tools in enhancing critical thinking, collaboration, and the understanding of historical events from diverse cultural perspectives.

Keywords: international program, World War II, digital tools.

DECIDING BASED ON DATA: AN INNOVATIVE INSTRUCTIONAL SCENARIO USING THE PROJECT METHOD IN A SECOND CHANCE SCHOOL

Apostolou Georgios

Secondary Education
Filippiada, Greece
e-mail: mari.maria2@yahoo.gr

ABSTRACT

Second Chance Schools (SCS) constitute a significant educational institution aimed at adult learners, offering them a renewed opportunity to complete basic education and develop the knowledge and skills necessary for effective integration into the labor market and society. Within this context, an instructional scenario was designed and implemented using the project-based learning (PBL) method. The aim was to foster understanding of the importance of data and its role in informed decision-making.

Learners engaged with a contemporary and practical issue: how to make informed decisions based on data rather than subjective assumptions or misleading information. In an era where information is abundant yet often unreliable, the ability to analyze and interpret data is critical. Participants were trained to utilize tools such as online statistical resources, brainstorming, ChatGPT, SWOT analysis, descriptive statistics, Pareto diagrams, control charts, and Excel to process and evaluate information from various sources. The learning process began with an exploration of the importance of data and the scientific approach to truth-seeking and decision-making. Building on prior instruction in mathematics, computer literacy, and social sciences, learners acquired basic statistical skills and applied analytical practices to everyday situations. They then selected topics of personal or professional interest, collected and organized data, and used the available tools to analyze it. Through this process, they learned to distinguish reliable from unreliable sources, identify patterns and trends, and draw conclusions based on objective evidence.

Participation in the project significantly enhanced learners' self-confidence, as they witnessed firsthand the utility of data analysis and methodical thinking in decision-making. Furthermore, through collaboration and discussion, they developed skills in teamwork, reasoning, and reflective thinking. This pedagogical approach transcended the classroom, equipping learners with the competencies needed to become more active and informed citizens. The results of the implementation demonstrated strong engagement, as learners recognized the value of evidence-based thinking in both professional and personal contexts. This project can serve as a model for instructional practice that promotes critical thinking and scientific reasoning in decision-making, offering a meaningful learning experience tailored to the needs of adult learners.

THE FOREST …MY LIFE: EXPERIENTIAL LEARNING WITH DIGITAL TOOLS

Grammatikopoulou Sofia
Preschool Teacher, Head Teacher
2nd Preschool of Triadi
Thessaloniki, Greece
e-mail: sophiagram@hotmail.com

Mallidou Malessa Evangelia
Preschool Teacher
6th Preschool of Thermi
Thessaloniki, Greece
e-mail: lia2ms@gmail.com

ABSTRACT

A school-project related to the forest was implemented in the school year 2024-25. Digital tools of new technologies were included both in the didactic planning and throughout the implementation. The aim was for children to discover knowledge and become interested in the forest as an ecosystem and as sensory enjoyment of nature through experiential activities, to strengthen their environmental awareness and active citizenship. Interactive and digital media were used, highlighting the dynamic relationship between digital pedagogical and educational technologies. The methodology followed was based on a child-centred, research -based approach, combining exploration and collaborative learning.

Athens, Greece
e-mail: katsouf12@gmail.com

ABSTRACT

The present study explores the systematic integration of Artificial Intelligence (AI) in the teaching of A΄ Lyceum, focusing on the teaching approach of topics related to teleworking and distance communication. The purpose of the paper is to demonstrate how AI tools can support the acquisition of basic skills from remote collaboration while enhancing students' autonomy and creativity. The research intervention was based on a modern educational project-based learning scenario, integrating applications such as ChatGPT, automatic presentation creation systems and collaborative project organization platforms. The methodological approach, the pedagogical framework and the tools used are presented, with emphasis on the practical application of teleworking in a school environment. The results highlight the importance of AI as a tool to differentiate teaching, support metacognitive skills, and enhance student collaboration and participation. AI has also helped personalize teaching, improve communication skills, and promote professional readiness. The paper proposes prospects for the future use of AI for the teaching of complex skills, emphasizing the importance of developing pedagogical frameworks and ethical guidelines for its sustainable integration into educational practice.

ABSTRACT

The transformation of the frontal system (in which the desks are one behind the other, opposite the teacher's chair) into a lesson with children in subgroups does not give the classroom the (without competition, between the children, due to the tightening of interpersonal relationships, within the subgroup, to deal with other subgroups) student-centeredness that we seek, as the subgroups operate, anyway, competitively, towards each other. The purpose of the practice was the student-centeredness of the class as a whole, with the desks in a circle and (due to the abolition of the chair) with the teacher (from being the ruler of the class, from his chair, which he was), now, simply, the coordinator of the lesson, which will be conducted (due to the mitigation of the tightening of the children's relationships, which was intensifying, to deal with the children of the other subgroups, which will no longer exist) non-competitively, but competitively, among themselves, by the children themselves. The practice (completely his personal initiator) was applied in school units, of secondary, mainly, formal and informal, education, from 1979 (the year of his appointment as a teacher) to 2013 (the year of his retirement). Its (as a completely personal, personal practice) methodology is based on the transformation of the frontal, towards the teacher, desk placement into a circular one, abolishing the teacher's seat, making the parallel, individual, one-way, from and to the teacher, actions of the students of the frontal system group action, in which, now, they will be able, de facto, to have, everyone the same opportunity to be co-creators of the common work of the class. Initially, a sociogram is designed, obviously, for the relations of the children, in the department, by the children or even the teacher, for any use, by the children and the teacher, and a discussion follows, for the statute of the class's operation, its drafting and signing. The meeting for conducting the children's lesson is held as follows. From the previous day, the children are informed about the lesson of the day, in order to process it. After a very short, informal introduction by the teacher, the class, in effect, becomes, in a circle, an immense laboratory. Each child, having a complete picture of the actions of the others, can be a regulator of the result. The lesson is a single (not as parts of examination and delivery) discussion platform. The teacher does not have a permanent seat, but moves around, where necessary, for the best coordination of the lesson. In the circular placement of the desks, the blackboard has also been abolished. During the period of implementation of the practice, it had been replaced with cardboards, to demonstrate to others what was written on it. Now, however, the last problem that the practice faced is being overcome, with its replacement by so many computer screens, for each child. Each child will be able to write or draw or form or whatever, on their computer, and all the other children will see this, who will also be able to participate, in what this child did, interactively, for any, common, result. The product produced is captured in (shared, competitive, evolving) "books", by the children, for each lesson, for all interests, as "Free Optional Work, for home". Since the children are, as co-creators, the creators of the lesson, they are also the ones who evaluate it. The evaluation forms are collected at the end of each week, month, quarter, four-month, semester, year, to extract the average score, by the department, for each child, with the teacher having, with the sociogram as an advisor, any (if any) possibility of modifying (the average of the self-intersecting, this, evaluation) intervention. The

positive results are reflected in the scientific development of the children, which (positive comments from third parties, deposited, in the "Archive of Student Creation" of the Organization) was (also) due to this practice. However, due to the fatigue, which it entails, for the teacher, although very positively accepted, it did not, unfortunately, have an impact.

Keywords: teacherless lesson, self-regulation of the classroom, self-study, circular seating, conference lesson, cross-assessment

ABSTRACT

The image contains a multitude of information, which is perceived as a whole, the complexity of the relationships of the parts of which makes it difficult, with its complexity, in fact, to interpret it. This difficulty is greater, in the case of the need to give, in a hurry, an answer to it. This work aimed to study the ability to recognize emotional facial expressions, in their sudden projection, on the computer screen, in the context of a lesson, which the teacher should be aware of. In the research that we present in this work, (61 men and 104 women =) 165 subjects, who live in Greece, 25-55 years old, of average educational level, participated. The Ekman and Friesen series of 65 slides of faces with one (from the whole or part of the face) or more emotions (F.A.S.T., 1971) was used. The subjects had to, in a first projection, identify one (definitely, and only one) of the seven universally recognized emotions (happiness, sadness, fear, anger, surprise, disgust, contempt) and, in a second phase, with the same projection order, assign a (definitely, and only one) score, from 0 (absence of emotion) to 8 (intense presence of emotion), to each of these emotions, on prefabricated answer sheets, both times. The projection time of each slide was, progressively, 10΄΄-5΄΄ and 25΄΄-10΄΄ and the intermediate time, for noting the answers, was 5΄΄ and 10΄΄, respectively, for these phases. The data were entered into seven, as many as the emotions, aggregated tables, for each gender. From these, for each slide, the percentage of emotional meaning preferences and the average intensity attributed to them by all subjects were obtained. Then, based on the slides that accounted for 20% or more of the acceptance of the subjects of the two groups (men - women), for their specific emotional meaning, a dictionary of emotional meaning was constructed, which was attributed by each group, for each group. In this, the comparable cases, intragroup and intergroup, are shown. The statistical analysis ($\chi 2$, for intensity, and t test, for frequency) concerns the control of: a) the intensity, based on the rating, attributed, by the subjects, to each emotion, b) the frequency of recognition of emotions, and, in comparison with international standards, c) the intensity of emotions that were truly recognized, d) the frequency of emotions that were truly recognized. The results show the following: The ability to recognize emotions is, in general, good, to a comparable degree, within and between groups, deteriorating, despite the progressive ease of true recognition, which comes from practice, as the projection time decreases and the available time for this recognition decreases. People, in general, do not see very different emotions, in the face, even when it comes to different genders. Without the stress of the fast process, we make the most recognitions and true recognitions of emotions, while, with it, the score we give to the emotions we recognize is usually higher than the score we give without it. The difference, with women excelling in the recognition and true recognition of emotions, from men, without this stress, with it, seems to be essentially non-existent. In the case of the fast process, with the stress that creeps in, in the single-meaning expressions, we do better than in the multi-meaning ones, as, of course, in the slower process, without this stress. In general, the ability to recognize emotions is better without the stress of the fast process, and especially in women. With the stress of studying,

to absorb, organize and interpret, within the minimum available time, a large volume of information, our brain becomes confused, which makes it difficult for us to recognize the message being transmitted to us, resulting in, how much more so, if we are dealing with moving images, not static ones, wrong assessments.

Keywords: information fatigue, brain fog, accurate message recognition

INNOVATIVE TEACHING APPROACHES: ENHANCING INDEPENDENT LEARNING THROUGH ARTIFICIAL INTELLIGENCE AND MUSIC

Zoi, Sofia
Electronics Teacher
1st Vocational High School of Ioannina
Ioannina, Greece
email: sofzoi7@sch.gr

ABSTRACT

The experience of teaching fundamental concepts of electrotechnology to high school students has highlighted the significant difficulties faced in understanding electricity related problems. Many students exhibit gaps in prerequisite knowledge, they are unfamiliar with the methodology of Physics and struggle to develop independent learning skills through textbook study. Additionally, phone use for social media, music and games distracts them from the learning process. These observations underline the need for an alternative teaching approach that combines digital technology and the students' interests within the learning process.

Taking above factors into account, a teaching scenario was developed and implemented, leveraging modern artificial intelligence and music tools. The primary objective of this scenario is to encourage students to engage with their textbooks, familiarize themselves with the laws and theories of their study of interest in order to establish a foundation for independent comprehension without the need for auxiliary methods. This approach does not focus solely on understanding physical phenomena but primarily on developing autonomy in studying and the students' ability to seek out and interpret textbook information.

The teaching methodology is based on Lev Vygotsky's theory, which emphasizes the importance of social interaction in learning. The implementation involves the use of the SUNO application, supplemented by the Audacity and Openshot software.

The teacher (or a group of teachers) creates a music piece incorporating lyrics related to science concepts and contemporary sounds without requiring musical knowledge. Students listen to the song and watch the accompanying video. Then, they identify corresponding information in their textbooks and link it to the scientific terminology. Additionally, they complete conceptual charts, which serve as knowledge organization tools. This process evolves into students creating their own music pieces. They are divided into groups and after they study the theoretical terms of a new chapter, they compose their own lyrics and song. This activity aims to primarily strengthen students' ability to comprehend scientific concepts independently as presented in the school textbook and secondarily enhance creativity and collaboration.

This scenario was applied in teaching the units "Basic concepts of direct current" initially, followed by "Electromagnetism" to sophomore students. Findings from the implementation suggest that artificial intelligence and music can serve as learning motivators increasing student engagement and enhancing memory recall of scientific concepts.

This study highlights the importance of utilizing innovative tools in science education and proposes further exploration of similar approaches in the future. It's a dynamic scenario, that with minimal adjustments, can be easily applied on other subjects. Additionally, for younger students, it offers flexibility for an intersectional approach involving subjects such as Literature, Technology, Informatics and Music. The integration of multimedia technologies and creative activities can be an effective strategy to enhance students' learning experience and autonomy in the educational process.

Keywords: innovative teaching approaches, artificial intelligence, music, educational tools, independent learning, learning experience.

ART AND DIGITAL MEDIA IN EDUCATION: A CASE STUDY AT THE EVENING VOCATIONAL HIGH SCHOOL OF PREVEZA

ABSTRACT

This case study was conducted within the framework of the Research Project course of the first grade curriculum at the Evening Vocational High School of Preveza and addresses the use of art combined with digital media in the educational learning process. Students' engagement with art began with an introduction to world-famous painters through digital presentations and videos. Then, students recreated characteristic works of these artists as murals on a classroom's blank walls, which were previously undecorated. The reproduction of the artworks on the walls utilized a projection screen, computer, and digital applications for image editing. The activity mainly involved adult students, who constitute the majority of the school's population.

The aesthetic experience is particularly interesting, as it represents an innovative educational method that can contribute to Transformative Learning and has been applied not only in adult education but across all educational levels in recent years.

Observing a work of art during an educational process stimulates impulses and activates the learners' critical thinking. For this reason, the purpose of this action was to evaluate the implementation of learning through art, the aesthetic transformation of a school classroom with artworks, and the familiarization with basic digital tools. Aiming to highlight an alternative teaching method for adult students at the Evening Vocational High School, the study investigated students' attitudes during the activity and the contribution of art to their active participation, enhancement of critical thinking, and the potential redefinition of stereotypical views and assumptions.

The goal was to explore the extent to which learners utilize all their senses, use their imagination, draw on existing knowledge and experiences, and develop the ability to think critically during the educational intervention through the use of artworks combined with basic digital media.

Thirteen students aged between 18 and 61 participated, and observation was chosen as the methodological tool, providing an opportunity to collect data emerging from real situations through learners' statements, gaining more personal information.

The educational intervention contributed both to learners' familiarization with art and digital media. Additionally, it fostered collaboration and exchange of personal experiences. Participants managed to process their prior perceptions, think critically about them, and in some cases revise them, developing reflective dialogue. The involvement of emotions and the liberation of thought and expression led to a change in attitude towards this novel learning experience, initially met with reservation but gradually with pleasure and enthusiasm. The positive impressions gained and new knowledge acquired motivated further engagement with art, which contributes to the ability to perceive things from different perspectives and the possible redefinition of assumptions.

Keywords: Adult Education, Transformative Learning, Art, Digital Media, Critical Thinking.

DIGITAL TOOLS FOR EFFECTIVE TEACHING PRACTICE

ABSTRACT

The subject of this thesis is the presentation of five innovative web 2.0 tools that have the following characteristics: they are very easy to use and do not require special digital skills, they are completely free of charge or they have a free version with a wide range of possibilities for the user and arouse interest, which makes them suitable for integration into the learning process. As teachers who love their profession and who constantly aim to improve the quality of their teaching and enrich it with new media and modern teaching methods, we are looking for easy-to-use tools to create quizzes, exercises, presentations, new textual genres and general teaching material for our classroom. Therefore, we attend various seminars and trainings related to educational issues. Among them, we highlight the eTwinning seminars, where modern tools are presented, among other things, to be used in various ways in the learning process.

We have used several of them in our lessons and some of them we have distinguished particularly for their characteristics but also for their multifaceted pedagogical use in the learning process. These are EDpuzzle, Book Creator, Quizziz, Wordwall and Artsteps. In our work we deal separately with each of the tools and explain with examples and pictures how easy they are to use and how they can find effective application in the learning process. We emphasize their basic characteristics and comment on how they are used pedagogically.

Keywords: quizzes, multimedia digital enrichment.

THE ADVANTAGES OF ELECTRONIC BOOKS IN HISTORY TEACHING: A CASE STUDY FOR THE 3RD GRADE OF SECONDARY SCHOOL

Lefka Vasiliki

email: mtsiouri@sch.gr

ABSTRACT

In modern educational environments, the integration of digital media and tools into teaching practice is emerging as a crucial factor for enhancing the learning experience and promoting active learning. Especially in history teaching, electronic books (e-books) constitute a modern and dynamic form of digital media that can be effectively used to offer multiple benefits. These benefits include the enrichment of teaching material with multimedia elements such as interactivity, the enhancement of student-centered learning, the promotion of differentiated teaching, and the development of digital skills in students. This paper proposes, as a good practice for using digital media in the educational process, the creation and use of an original e-book for the combined teaching of various history units of history in the 3rd grade of secondary school. In particular, it presents the case of an e-book created with the Book Creator platform, designed specifically to serve as a tool for teaching the most significant historical milestones in the formation of the Greek state's borders, within the 3rd -grade history curriculum. By leveraging various multimedia elements such as maps, images, videos, voice narration, and interactive and collaborative activities, the e-book aims to make history learning more engaging and effective for students. Its ease of use, diverse interactive content creation capabilities, and flexibility in adapting to the needs of both the lesson and the student contribute to a better understanding of historical narratives, a development of historical thinking, and a critical approach to historical sources by students, as well as fostering student self-initiative and digital literacy. The conclusions from the pilot implementation of the e-book in the classroom, the students' impressions, their responsiveness, and their interaction with the book provide significant information about its overall contribution to the learning process, the understanding of the past, and the conquer of historical knowledge.

Keywords: e-book, history teaching, digital media, Book Creator, student-centered learning, multimedia elements

EXPLORING THE WORLD WITH GEOGRAPHIC INFORMATION SYSTEMS (GIS): GEOGRAPHY IN PRACTICE

Bagkou Evangelia
Teacher, Geoinformatics & Surveying Engineer – MSc. in Environment,
3rd Experimental Primary School of Evosmos
e-mail: li.mpagkou@gmail.com

Vasiloudi Angeliki
Teacher, Postgraduate Student
3rd Experimental Primary School of Evosmos, A.U.Th.
e-mail: vasiloudia@gmail.com

ABSTRACT

Education, and geography, in particular, require innovative programs and original ideas. The New Curriculum for Geography in Primary Education (2021) introduces Geographic Information Systems (GIS) into teaching practice. However, it does not provide specific guidelines for teachers on how to achieve this goal. To bring Geography into practice, we have integrated GIS into the curriculum allowing students to explore the world using these systems.

This innovative initiative will be carried out with 22 sixth-grade students at the 3rd Experimental Primary School of Evosmos, from February to June 2025. The program takes place during school hours and is integrated into the activities of the second and third school trimesters. It is carried out in collaboration between the class teacher and the ICT teacher specializing in GIS.

This study aims to present examples of activities of this innovative approach to teaching Geography. Specifically, the objectives of the program include: (a) Promoting students' spatial awareness through the use of Geographic Information Systems (GIS), (b) Developing data analysis and problem-solving skills, (c) Promoting collaboration and teamwork through the study of geographical topics; and, d) Connecting Geography to everyday life and modern societal needs.

Through these activities (data collection, creation of linear – point – polygon files, export of final maps), students engage in basic mapping functions, analyze geographic data, and create interactive maps on which they visualize the information they collect.

Expected learning outcomes include:

1. The development of skills that include the use of technology and geographic data
2. Critical thinking through information analysis and synthesis
3. Spatial awareness and understanding of the natural and man-made environment.
4. Developing basic skills in digital design programs.

Topics covered in this course include: a) The natural characteristics of Greece (mountains, rivers, seas), b) Human activities and population distribution, and c) Environmental issues (e.g. green spaces, pollution). Students will work in teams with assigned roles and apply data collection, analysis, and visualization methods.

To accomplish the goals of the program, students will use ArcGIS Online software, Geography textbooks, online maps, geographic databases, and photographic material collected by the students. ArcGIS Online software was chosen because it was considered by educators to be the most reliable design program and can be used for free for a certain period.

This initiative has not been previously implemented at our school. However, it is based on internationally recognized practices for teaching geography using modern technological tools such as Geographic Information Systems (GIS). The program is an initiative that introduces students to the use of innovative methods, adapted to the needs of the educational community for the development of skills.

Keywords: Geographic Information Systems (GIS), Interactive maps, innovative actions, ArcGIS, Geography Teaching, Elementary School

THE USE OF PODCASTS IN LITERATURE COURSES – A QUALITATIVE APPROACH

ABSTRACT

This research paper examines the use of podcasts as a modern educational tool in the teaching of literature courses. The aim of the study is to investigate the pedagogical value of podcasts, to understand how they shape the learning experience of students, as well as to evaluate their effectiveness in improving understanding and critical approach to literature, language and history. The methodology of this specific research is based on qualitative methods, including semi-structured interviews with philologists and secondary school students, as well as content analysis of selected educational podcasts. Particular emphasis is placed on evaluating interactivity, narrative approach and the degree of student engagement in the learning process through the audio experience. At the same time, factors that influence the acceptance of podcasts as a learning medium are explored, such as thematic content, quality of production, linguistic adaptation and relevance to school curricula. The findings of the research reveal that the use of podcasts in teaching can offer multiple benefits. Specifically, it enhances learning flexibility, allowing students to acquire knowledge at any time and from any environment. In addition, the narrative format and the use of audio create a more vivid and enriched learning experience, which can increase students' attention, concentration and engagement. However, challenges are also recorded, such as the absence of visual stimuli, which are critical for some teaching units, as well as the need for carefully selected and quality-controlled content. In conclusion, the research highlights the potential of podcasts as a complementary teaching tool for literature courses, highlighting the need for their integration into organized educational strategies. The creation of specialized educational content, adapted to the needs of students, is proposed, as well as the training of teachers in their effective use. With appropriate pedagogical guidance, podcasts can contribute substantially to the cultivation of critical thinking, creativity and active participation of students in the learning process

Keywords: podcasts, literature education, philology, multimodal learning, qualitative research, student engagement

BEST PRACTICES FOR INTEGRATING DIGITAL TECHNOLOGIES IN TEACHING: A HOLISTIC APPROACH

ABSTRACT

The present study focuses on best practices for integrating digital technologies into teaching through a holistic approach. Its aim is to present contemporary pedagogical strategies that leverage digital tools, highlight their advantages and inherent challenges, and propose specific applications in both the Greek and international contexts. Through the literature review, the exploration of innovative practices and the analysis of relevant policies and recommendations, the study aspires to provide a comprehensive resource for educators, researchers and educational institutions.

The methodological approach relied on an extensive review of recent research and case studies, aiming to identify current trends and innovative pedagogical practices using digital tools in education. The analysis was thematically organized, examining the implementation of technologies in blended and hybrid learning, the pedagogical potential of multimedia and interactive tools, the utilization of Virtual Learning Environments (VLEs) in teaching, as well as assessment and feedback practices through Learning Management Systems (LMS) and the role of Artificial Intelligence (AI) in enhancing personalization and optimizing the learning process.

The findings indicate that the purposeful, targeted and pedagogically informed use of digital technologies can significantly enhance active engagement, collaboration and self-regulation among learners, while also improving teaching quality and enabling real-time personalized assessment and feedback. In conclusion, it is argued that the systematic integration of digital tools within a holistic strategy framework fosters flexible, adaptive and effective learning environments.

Keywords: Digital learning tools, innovative pedagogical practices, VLEs, Artificial Intelligence, personalized learning, digital assessment systems.

ABSTRACT

The integration of digital tools into modern educational practices is a critical factor in enhancing teaching and developing STEM skills among students. Although there is no specific definition in the European Union, STEM generally refers to the fields of science, technology, engineering, and mathematics, which are considered vital for innovation, economic growth, and prosperity. STEM education emphasizes critical thinking, problem-solving, and creativity, combining theory with practical application.

In this context, this study presents the use of soil moisture sensors in combination with technological tools to enhance the learning process in the "Plant Production" course for the second grade of the Unified Special Vocational High School (E.N.E.E.GY.-L.) in Mesolongi. The program was implemented by students under the guidance of their teachers within the framework of the course's laboratory instruction.

This approach enables the collection, analysis, and visualization of real-time soil moisture data. Students actively participate in placing sensors in the school garden, recording moisture data through digital platforms and software such as Arduino and Raspberry Pi, and comparing measurements with traditional irrigation practices. In this way, they develop foundational knowledge in agronomy, informatics, and mathematics, while strengthening critical thinking and problem-solving skills.

Furthermore, this interdisciplinary approach facilitates the connection between theoretical knowledge and practical application, making learning more experiential and tailored to students' needs. Additionally, the use of data fosters environmental awareness and an understanding of the importance of rational management of natural resources, such as water in irrigation.

The study outlines the stages of designing and implementing the program, as well as the pedagogical benefits derived from using soil moisture sensors in educational practice. It also analyzes the technical and instructional tools used, the challenges encountered, and the prospects for further development of the method within the context of special education.

The results of the implementation demonstrate that integrating soil moisture sensors and digital tools into the teaching process enhances experiential learning, develops STEM and digital literacy skills, and improves collaboration between students and teachers. Consequently, it is proposed that this methodology be extended to other educational levels to create innovative learning environments that leverage technology for the benefit of education and sustainable development.

Keywords: Soil moisture sensors, digital tools in education, interdisciplinary learning, STEM strategies

eTwinning: BUILDING A STRONG COMMUNITY OF INNOVATIVE TEACHERS

Paraskevas Michael
Professor of the University of Peloponnese, Vice President of CTI "Diophantus",
Head of National Support Organization for eTwinning
Patras, Greece
email: mparask@cti.gr

ABSTRACT

eTwinning has been designated a flagship action by the European Commission with the objective of fostering educational innovation, promoting collaborative learning, developing digital skills and encouraging intercultural understanding. Since 2005, Greece has cultivated a dynamic community of teachers, schools and pedagogical students who have implemented thousands of collaborative projects, many of which have received high distinctions. The eTwinning National Support Organization cultivates competences related to ICT, AI and modern teaching methodologies through a variety of means, including its Open Online Courses, STEM activities, the Initial Teacher Education initiative and other actions. The network of ambassadors and institutional partners facilitate the dissemination of good practices and participation in international competitions, while publications and digital repositories support the dissemination of knowledge. The Greek experience corroborates the function of eTwinning as a catalyst for the transformation of educational culture and the establishment of robust learning communities at both the national and European levels.

ABSTRACT

This study focuses on assessing the "temperature" of Human Rights within the educational community, aiming to evaluate the climate in relation to human rights and the implementation of the principles outlined in the Universal Declaration of Human Rights. The objective is to highlight the importance of equality, safety, and the protection of students' rights. The methodology used involves a Google Forms questionnaire based on 25 critical statements directly related to human rights, such as safety, equal access to education, participation in democratic processes, and freedom of expression. The questions evaluate the application of these rights in everyday school life, using a scale from 1 to 4 to provide a quantitative estimate of the state of human rights. The questionnaire was distributed via participants' emails and school websites, ensuring broad accessibility.

A total of 235 students from four schools participated in the evaluation: the 1st General High School of Preveza, the Evening Vocational High School of Preveza, the 1st Vocational High School of Karpathos, and the 1st Vocational High School of Heraklion, Crete. The goal was to conduct a comprehensive review of the perceptions and experiences within the school community. Excel was used to process the responses, extract statistical conclusions, and create charts to visualize the results. The evaluation process aimed to document the prevailing climate and analyze areas that may require improvement. Particular emphasis was placed on identifying areas of discrimination based on gender, race, physical and intellectual ability, as well as on issues related to student and school community participation in decision-making processes. A significant goal was to ensure equal access to education for all members of the community and to combat inequality and discrimination.

The assessment of the Human Rights "Temperature" was combined with the use of modern digital tools, which enhanced participation and collaboration among students, teachers, and others. The digital tools used included computers, tablets, mobile phones, projectors, and the internet. Online meetings were organized via Zoom to discuss the results and exchange views. Challenges related to the use of digital media in the educational process were also acknowledged. The study highlighted the need for measures to protect personal data and privacy within the educational community. The findings suggest that the "Temperature" of Human Rights can be improved through continued education and the implementation of strategies that promote equality and acceptance of diversity. At the same time, the integration of digital tools into the educational process not only increased student participation but also strengthened communication and transparency within the community. Google Docs was used to draft a digital report of the research findings, ensuring immediate access for all participants from the four schools. PowerPoint was also used to create an interactive presentation of the report's key points.In conclusion, the study demonstrates the need for a comprehensive approach that combines the evaluation of human rights with the application of strategies and digital tools. It emphasizes the importance of ongoing efforts to promote social justice, solidarity, and respect for human rights within the educational community.

Keywords: Human rights, educational community, digital media.

PRESENTATION OF BEST PRACTICES IN THE USE OF DIGITAL TECHNOLOGIES IN TEACHING PRACTICE AND IMPLEMENTATION OF DIFFERENTIATED TEACHING AND ASSESSMENT ACTIVITIES WITH DIGITAL TOOLS, ACCORDING TO THE NEW 2023 CURRICULUM FOR THE FRENCH LANGUAGE

Sita Ntounta Evangelia
Teacher of French Language (PE05)
Directorate of Secondary Education of Ioannina, M.Ed. HOU
Arta, Greece
e-mail: evangelia.sita@gmail.com

Aggeli Dimitra
Postgraduate Student in "Policy, Administration and Evaluation in Education"
Department of Primary Education (NKUA)
Teacher of French Language (PE05), Directorate of Primary Education of Ionian Islands, M.Ed. HOU
Arta, Greece
e-mail: dimoulaaggeli71@gmail.com

ABSTRACT

"Presentation of Best Practices in the Use of Digital Technologies in Teaching Practice and Implementation of Differentiated Teaching and Assessment Activities with Digital Tools, According to the New 2023 Curriculum for the French Language"

The integration and utilization of digital technologies in foreign language education play a leading role in the implementation of the New Curriculum's objectives in a constantly evolving digital world that is rapidly moving into the era of the enormous impact of artificial intelligence tools. Their pedagogically oriented use in teaching, based on lesson planning and expected learning outcomes, enriches its content with rich authentic and up-to-date material. The learning process becomes more attractive and playful for students, who actively participate with experiential activities in digital environments, thus developing digital literacy skills as well as a range of other soft and social skills, gradually transforming the classroom into a community of creative learning.

The purpose of this presentation is to highlight the possibilities that digital tools offer for the differentiation of teaching and assessment, as well as to present specific practices and examples of their application in educational practice. Furthermore, it seeks to examine the challenges and prospects associated with the integration of new technologies in instructional design according to the New Curricula.

More specifically, our presentation will highlight that digital tools support the provision of personalized learning experiences that meet the needs and interests of each student, create flexible learning environments that allow students to learn in their own way and pace, and develop digital skills in students and teachers.

Additionally, it will highlight that the e-portfolio, as a dynamic repository of learning artifacts, emerges as a significant tool in learning assessment. By incorporating principles of authentic assessment, the e-portfolio allows for the holistic representation of the learning journey, focusing on the development of metacognitive skills and the enhancement of self-regulation. Through the collection of various artifacts, the e-portfolio promotes introspection and critical analysis, facilitating formative assessment and providing continuous feedback for improving learning.

Finally, our proposals are addressed to educators, researchers, educational policy makers, and other stakeholders, suggesting actions to promote differentiated teaching and assessment using digital tools, contributing to the development and implementation of innovative teaching practices that meet the needs of 21st-century students.

Keywords: digital tools, differentiated teaching, e-portfolio, new curricula

ABSTRACT

The teaching scenario presented was designed in accordance with the Thematic Areas and Expected Learning Outcomes of the new Preschool Curriculum, focusing on the stages of plant development (Physical Sciences), while also involving the Thematic Areas of Social Sciences and Information and Communication Technologies (ICT). The objective of the scenario is to utilize Artificial Intelligence (AI) interfaces as a tool to enhance experiential learning through interactive and collaborative activities.

The 5e didactic learning model (Engage, Explore, Explain, Elaborate, Evaluate) proposed by the new Curriculum for Preschool Education follows and is structured as follows: the learning and process begins with the introduction of an interactive voice AI through which a virtual bee appears in the classroom and asks for help from the students to learn how the plant grows. In this way, the children's interest and curiosity about the subject is activated (Engage). Then, the toddlers are divided into groups, they search for information about the growth of plants using educational digital material, while the role of the teacher is coordinating and guiding, as through targeted questions he encourages the children to formulate their initial knowledge and to better understand it by enriching it (Explore). The Interpretation phase follows, where the bee asks for further clarifications and the children, using AI tools, collaborate again in small groups and present to the plenary the result of their work and what they have learned, thus strengthening their linguistic development and promoting their critical thinking (Explain). For the Elaborate activity, digital assessment games (e.g. Wordwall, Quizizz, LearningApps) are used both for assessment and for the repetition of concepts in a playful way to capture the children's knowledge in a natural and enjoyable way. In this way, toddlers develop creative thinking and digital expression skills. The last stage, that of Assessment, is completed with self-assessment and peer-assessment activities, to cultivate metacognitive skills in students and their ability to reflect on their learning process.

In conclusion, this specific teaching scenario highlights the potential of Artificial Intelligence in preschool education, proposing a multidimensional, interactive and collaborative approach to learning. The use of innovative technologies not only enhances the learning process but also shapes the school of the future, in which digital innovation coexists with pedagogical creativity.

Keywords: Artificial Intelligence Interfaces, 5e teaching model, digital learning, early childhood education and AI.

THE USE OF DIGITAL TECHNOLOGIES IN CHEMISTRY TEACHING: A STUDY OF ELECTRICAL CONDUCTIVITY OF SOLUTIONS THROUGH PhET COLORADO INTERACTIVE SIMULATION

Tzanaki Nikoletta
Secondary Education Teacher, Chemist MSc
3rd Gymnasium of Preveza, Directorate of Secondary Education of Preveza
Preveza, Greece
e-mail: letzan@gmail.com

ABSTRACT

The integration of digital technologies into Chemistry teaching promotes active student engagement and a deeper understanding of scientific concepts. This study presents an instructional proposal for exploring the electrical conductivity of aqueous solutions, combining real experimentation with the interactive PhET Colorado simulation "Sugar and Salt Solutions". The teaching approach is grounded in Inquiry-Based Learning (IBL) and was implemented with 8th-grade students over two class sessions. In the first phase, students worked in groups to formulate hypotheses and conduct experiments with aqueous solutions of salt (NaCl) and sugar ($C_{12}H_{22}O_{11}$), recording and analyzing their results. In the second phase, they used the simulation to observe the dissociation of NaCl into ions, thereby understanding the relationship between chemical structure and conductivity.

The presented teaching intervention significantly departs from traditional instructional approaches by promoting inquiry-based learning and engaging students as active participants in the educational process. Students worked within a dialogic learning environment, developing critical thinking skills and a solid understanding of fundamental Chemistry concepts, such as conductivity and the nature of chemical compounds. The success of the intervention—structured around the 5E model (Engage, Explore, Explain, Elaborate, Evaluate)—was evident in the students' worksheets, which demonstrated high rates of correct responses and effective use of scientific terminology, indicating conceptual understanding and the ability to apply knowledge in new contexts.

At the same time, the use of both real and virtual experiments contributed to a multimodal teaching approach, making abstract concepts more accessible. The combination of these methods enhanced student participation and autonomy, especially among those who typically struggle. Students engaged actively in the learning process, developing skills in interpretation, prediction, and collaboration, and demonstrated the ability to transfer and extend their knowledge. The intervention highlights that the use of inquiry-based learning and digital tools, such as PhET simulations, can transform Chemistry instruction into a dynamic, experiential, and meaningful learning experience.

Keywords: electrical conductivity, PhET Colorado simulation, Inquiry-Based Learning (IBL), 5E model, multimodal learning.

INTERDISCIPLINARY APPROACH IN ENVIRONMENTAL EDUCATION: ENVIRONMENTAL ENGINEERING, CREATIVE WRITING, ARTIFICIAL INTELLIGENCE, AND DIGITAL MEDIA.

Toki Christina,
High school teacher, mechanical engineer, MSc, PhD
1st Technical High School of Artas

Peklari Vasiliki,
High school literature teacher, MSc
1st Technical High School of Artas

Stavros Mpardakas,
High school, electrical engineer, MSc
1st Technical High School of Artas

ABSTRACT

The interdisciplinary approach constitutes a fundamental pillar of modern educational practice, as it leverages knowledge and skills from different fields, creating a holistic learning experience. This presentation is a characteristic example of this approach, as it combines environmental engineering, creative writing, artificial intelligence, and digital media into a unified environmental educational activity.

The activity took place in a Vocational Upper Secondary School (EPAL) and focused on marine pollution, a significant environmental issue, aiming to raise students' awareness through a process of scientific understanding and creative expression. Specifically, in the first stage, students were informed about the causes and effects of marine pollution, acquiring scientific knowledge that formed the basis for the creation of their poems. Subsequently, they utilized creative writing techniques, such as selecting topic-related words, using images as stimuli for writing, and associative writing, to transform scientific information into poems. In the third stage, artificial intelligence was used to create images that reflected the content of the poems. Finally, the poems and images were compiled into an interactive digital book, which was the result of a collective effort. This collaboration highlighted the importance of interdisciplinarity, as each field complemented and enriched the other, creating a comprehensive educational experience.

The activity showcased the potential of digital tools in modern education, offering students the opportunity to express themselves creatively, develop digital skills, understand the topic through problem visualization, and enhance their environmental sensitivity. At the same time, it emphasized the importance of interdisciplinary collaboration, which allows students to address complex issues from multiple perspectives, strengthening their critical thinking. The presentation highlights the pedagogical benefits of this approach, the challenges encountered during its implementation, and future prospects for further utilization of technology in the educational process.

Keywords: Interdisciplinary approach, environmental education, creative writing, digital media.

PEDAGOGICAL USE OF DIGITAL AND TECHNOLOGICAL MEDIA IN THE TEACHING OF ENGLISH: A THEORETICAL AND PRACTICAL APPROACH

Tsiplakidis Iakovos, Special Teaching Staff, Department of Fine Arts and Art Sciences, School of Fine Arts, University of Ioannina, Greece, Associate Educational Staff of the Hellenic Open University
e-mail: itsiplak [at] uoi.gr

ABSTRACT

This paper focuses on an innovative educational design through the utilization of digital and technological tools in the teaching of English as a foreign language, which offer the potential to enhance the quality of the teaching and learning process. In this context, it proposes the pedagogical use of digital media, authentic sources, videos sourced from the internet, and Web 2.0 collaborative tools for the implementation of WebQuests. This design is proposed based on personal experience as well as research findings showing that the integration of digital and technological tools in teaching provides multiple benefits and that their effective utilisation is achievable and realistic, rather than merely theoretical.

The pedagogical use of digital media, collaborative tools and the internet for the implementation of WebQuests increases student motivation and fosters active engagement in the teaching and learning process. This is because WebQuests are grounded on topics and research areas that align with the students' interests and draw on their experiences in pedagogically sound ways. Furthermore, WebQuests encourage student initiative, support autonomous learning and a cross-curricular approach, addressing the problem of lack of engagement and indifference, since they constitute a student-centered approach. Additional benefits include the potential they provide for collaboration, the development of critical and creative thinking and inquiry-based learning, given that WebQuests encourage critical collection, analysis and processing of information and data, involving more than rote learning and quoting information. Another beneficial outcome is that they naturally integrate all language skills into teaching, that is, reading, writing, listening and reading within an authentic communicative context.

This paper focuses on the practical application of the basic principles of educational theory. We first present a brief review of the literature and research conducted in relation to the pedagogical utilisation of WebQuests, the use of online resources and videos from the internet in the context of teaching English as a foreign language. Drawing on the relevant literature, we then propose a WebQuest designed for students at the B1 proficiency level in English. The paper outlines the basic design, the implementation stages and the anticipated benefits, particularly those related to fostering collaborative learning, encouraging critical and creative thinking, utilizing authentic material and developing all language skills. Additionally, we provide guidance in relation to the effective implementation of the WebQuest, ensuring that the digital and technological tools are used meaningfully and innovatively to enhance student motivation and support language acquisition. English teachers can adapt the suggested activities and expand the scope of the proposed WebQuest, the use of digital and technological media and collaborative tools in order to suit the specific needs of their students and the broader context in which their teaching takes place.

Keywords: digital and technological tools, WebQuests, internet, English language

"GUYS, LET'S GO TO THE CHURCH!" A GOOD PRACTICE IN THE RELIGIOUS STUDIES LESSON USING MULTIMEDIA MATERIAL

Fakazis Ioannis
Educational Theologist,
5th General High School of Corfu
Corfu, Greece
e-mail: ifakazis@sch.gr

ABSTRACT

This article refers to a Religious Studies lesson that took place at Deskio High School of Parga during the 2022-2023 school year and was attended by 3rd grade students. More specifically, the thematic unit we dealt with concerned the chapter "Worship and Art in East and West", and particularly the part of the architecture and painting of the Orthodox Christian church, so we considered it appropriate to utilize relevant software. Some of the goals we set were: to recognize which style a Christian church belongs to, to know basic information about the church's iconography and its symbolism, to learn about the worship life that takes place in the Orthodox church etc. The material we used was Flora Tzanakaki's book "Let's Go to Church!", which contains a CD with software and activities.

The software includes in the main menu the basic sections: "Contents", which include 18 subsections with the main points of the presentation, so that someone can individually select the specific part they want to watch; the "Opening presentation", where the user can watch all the sections as a single presentation from the software avatar; the "360 degrees", where the possibility of a 360-degree virtual tour of the center of the temple is given; the "Activities", which contain digital activities that correspond to some of the sections presented by the avatar in the software.

The classroom lesson took place in three phases. Initially, students were briefed, given basic information about the topic and the software that would be used. The software was then shown on a video projector, with a virtual tour by an avatar in an ecclesiastical temple in Athens, providing basic information about the architecture and worship life in the Christian temple. We then proceeded to resolve digital activities existing in the software in question, related to the screening that took place earlier. Some of the activities we were engaged in had to do with: the rhythms of the temples, the orientation of the temple, the parts of the temple, the icons of the iconostasis and the illustration of the temple. In these exercises, four images are usually given, e.g. with the basic church styles (basilica, basilica with dome, cruciform with dome, catacomb), and four boxes with the names of each style. The user should drag each image with the cursor to the correct box.

The next phase was a visit to a local Orthodox church and church museum with a guided tour by the priest of the church. The students observed the church exhibits, parts of the church and the hagiographies, and they had the opportunity to ask questions and clarifications from the priest and their theologian. In the third phase, a worksheet was given where students, working in groups, answered questions about the lesson and the teaching visit that took place in the previous days.

Regarding the goals we set, we consider that they were achieved to a satisfactory degree, while the students' learning motivation also increased. We have generally utilized and continue to utilize new technologies both before and after the school year that we mention in our article (e.g. use of interactive whiteboards, use of PowerPoint, videos from YouTube etc.). In conclusion, we considered that the use of multimedia material constitutes an alternative teaching approach to the Religious Studies course in High School, which goes hand in hand with the general development of digital media in society and in education, and which can greatly contribute to the better assimilation of the teaching material by students.

Keywords: Orthodox Christian church, software, virtual tour, display, activities, visit.

TA11: Dynamic learning environments and digital educational tools

THE ESEP PLATFORM (EUROPEAN SCHOOL EDUCATION PLATFORM) AS A MEANS OF DEVELOPING DIGITAL SKILLS FOR EDUCATORS & STUDENTS – ETWINNING & ERASMUS+

Zantraveli Varvara
English Teacher - Principal - MED - eTwinning NSO Member
4th Gymnasio Prevezas
Preveza, Greece
e-mail: barbarazadraveli@yahoo.gr

ABSTRACT

The present study will focus on how the recently unified platform, ESEP (European School Education Platform), can serve as a means for promoting, developing, and cultivating the digital skills of members of the educational community.

The European School Education Platform (ESEP) is the meeting point for the educational community across Europe, including school staff, students, researchers, and policymakers. The platform also hosts eTwinning, the online community for schools in Europe. The benefits for educators are numerous. It aims at their professional development by providing access to a variety of continuous professional development courses, both online and in person, allowing teachers to enhance their skills and stay informed about the latest educational practices. It offers networking opportunities through the eTwinning community, where educators can connect, collaborate, and share ideas with colleagues from all over Europe, fostering a culture of shared learning and innovation. Lastly, it contributes to resource sharing, as it provides a rich repository of teaching materials and resources, enabling educators to access and contribute content that supports effective teaching strategies.

Similarly, the platform fosters collaborative learning among students. Through their participation in eTwinning projects, ESEP allows students to engage in joint projects with peers from different countries, promoting cultural exchange and teamwork. Additionally, it enhances digital literacy by involving students in activities that help them develop essential digital skills through the use of various online tools and platforms for learning and collaboration. Students can also obtain certificates recognizing their participation and achievements, boosting their motivation and enriching their educational profiles.

The ESEP platform has a significant impact on the educational community, strengthening the connections and collaboration between educators and students at the European level. By participating in programs such as eTwinning, teachers gain access to innovative teaching practices, while students familiarize themselves with modern technological tools, simultaneously developing communication and teamwork skills. Moreover, the platform facilitates the exchange of educational materials and best practices, supporting the continuous professional development of educators and promoting lifelong learning. Through these capabilities, ESEP plays a crucial role in shaping a unified and dynamic European educational space, where knowledge and innovation are shared and utilized for the benefit of all community members.

Despite its advantages, the use of the ESEP platform also comes with challenges. One of the main issues users face is the need to become familiar with the platform's environment, as time and training are required for its full utilization. Additionally, unequal access to technology and digital skills may pose a barrier for some educators and students, limiting their participation in available activities. Language differences can also create challenges, as communication and collaboration among users from different countries require sufficient language proficiency. Despite these difficulties, the continuous development and adaptation of the platform, along with the support provided to users, can help address these challenges, ensuring that ESEP remains a valuable resource for the European educational community.

This study will emphasize on the cultivation of digital skills, particularly through the description of specific projects in which teachers and students from the 4th Junior High School of Preveza participate during the implementation of eTwinning and Erasmus+ projects.

Keywords: ESEP, digital skills, educators, students, eTwinning, Erasmus+

DRAGGING AS A DYNAMIC MODELING OF THE TRADITIONAL, STATIC EUCLIDEAN ENVIRONMENT IN DYNAMIC GEOMETRY ENVIRONMENTS

Mastrogiannis Alexios

ABSTRACT

Traditional, static approaches offer techniques for mastering geometric concepts which can, of course, function as “scaffolds” and tools for the acquisition of knowledge. In the digital realm inhabited by today’s digital-native students, however, it becomes rather necessary to introduce and integrate technological, mediating tools as teaching media. Learning activities are designed and carried out more easily with the deployment of technology. Indeed, the learning of Geometry enjoys “preferential treatment” from Technology, since with the help of digital tools students model geometric topics and, within richly interactive learning environments, study a multitude of geometric forms.

The dynamic modeling of the traditional, static Euclidean environment through dragging (drag mode) is the most significant hallmark of Dynamic Geometry Environments. Dragging introduces motion, modification, and transformation into static Euclidean Geometry while preserving the fundamental relations and properties of figures, and it appears to be a powerful core of rich teaching and learning possibilities. The exploratory affordances of dragging constitute important cognitive supports and a strong pedagogical tool for fostering geometric reasoning, especially in the formation of hypotheses and conjectures. Constructing a figure on the screen represents an entire class of geometric objects, since, for example, when creating a circle, dragging yields infinitely many circles with a simple movement of the mouse.

This paper will present, in detail and with examples, seven different types of dragging, which students undergo during the process of solving open-ended problems and in relation to the use of the mouse: Wandering dragging, test dragging, dummy locus dragging, line dragging, as well as bound, guided and linked dragging are the critical forms of dragging, through which various representations of shapes are presented with a "cinematic" visualization.

Keywords: Dragging, Geometry, Dynamic Environments, Systems

MAPPING CULTURE AND ENVIRONMENT: A DIGITAL EDUCATIONAL ODYSSEY

e-mail: evtsioupli@gmail.com

ABSTRACT

This paper presents an innovative educational project that integrates digital tools to promote multiliteracies and experiential learning. Focusing on the cultural and environmental connections between Thessaloniki and Constantinople, the project centers around the Sustainable Development Goals 14 (Life Below Water), 15 (Life on Land), and 17 (Partnerships for the Goals). Using ArcGIS software, students created an interactive map that traces a land-and-sea route highlighting key cultural, historical, and ecological sites. Through this process, they developed digital literacy, environmental awareness, and cultural sensitivity. The program enhanced students' critical thinking and collaborative skills while fostering active citizenship and interdisciplinary understanding. ArcGIS enabled the combination of geospatial data processing with creative expression, supporting an integrated approach to education. Ultimately, the project demonstrates how the synergy of technology, culture, and environmental education can foster sustainability and cooperation. The student-created digital map serves as both a learning artifact and a public invitation to explore the shared heritage and future of these two historic cities.

Keywords: digital media, multiliteracies, ArcGIS, interactive map, critical thinking.

REINTERPRETATION OF VAN HIELE LEVELS OF GEOMETRIC THINKING UNDER THE ADVOCACY OF THE ADVANTAGES OF DYNAMIC GEOMETRY ENVIRONMENTS

Mastrogiannis Alexios
Quality Supervisor of Education

ABSTRACT

School Geometry, when presented axiomatically, assumes that students think in a formally deductive way. Another theory, however, concerning the learning of Geometry is the van Hiele theory, which today has a major influence on school Geometry, since despite the vast amount of research on geometric thinking, no proposal has attracted as much attention as the theory of the van Hiele levels of geometric thought. Indeed, the added value of the van Hiele model has been acknowledged in the description, study, and highlighting of geometric thinking. The van Hiele model consists of two main aspects. The first is a hierarchical sequence of five levels of reasoning processes and geometric thought. The second focuses on the development of students' intuition and emphasizes the learning phases, that is, the means employed by a teacher in order to increase the performance of their students through these different levels of thinking.

Research has shown that Dynamic Geometry Software supports students in the study of geometric concepts within motivating frameworks that activate and make use of the van Hiele theory. Activities based on the van Hiele levels of thought become easier and more effective with the presence of various technological tools, especially through Dynamic Geometry Software. This paper, after describing the van Hiele theory, goes on to argue in favor of Dynamic Geometry Software as advantageous tools of non-static visualization, capable of promoting students' thinking. Furthermore, it proposes—also through examples—a reformulation and reinterpretation of the five levels of van Hiele thinking, in the light of Dynamic Geometry Environments.

Keywords: Geometry, Dynamic Environments, Systems, van Hiele

TA12: The Internet of Things and education.

THE INTERNET OF THINGS IN EDUCATION: TECHNOLOGICAL APPLICATIONS, PEDAGOGICAL PERSPECTIVES AND ADOPTION CHALLENGES

Giourgas Angelos
University of Ioannina, Department of Informatics and Telecommunications
Postgraduate Student
Preveza, Greece
e-mail: pint00162@uoi.gr

ABSTRACT

This paper investigates the theoretical and technological foundations of the Internet of Things (IoT), as well as the challenges and prospects of its integration into the educational process.

Drawing on current research studies, theoretical frameworks, and empirical data, it examines the architecture and operation of IoT systems in education, and their convergence with emerging technologies such as Artificial Intelligence (AI), Cloud Computing, and Machine Learning (ML).

The study presents key IoT applications in educational settings, including smart classrooms, interactive whiteboards, wearable devices for tracking physiological and learning metrics, and automated platforms for learning analytics. It further discusses how IoT can enhance personalized learning, optimize resource management, and broaden access to educational tools.

A critical evaluation of the benefits and limitations of IoT in education is provided, with particular attention to issues such as data privacy and security, infrastructure costs, and the need for specialized technological training for educators.

Finally, the paper explores future developments in IoT adoption within the educational community, positioning it within a wider technological landscape. The transformative potential of IoT—especially when integrated with Augmented Reality (AR), Virtual Reality (VR), and blockchain—promises the emergence of more intelligent, adaptive, and secure educational environments. The systematic implementation of IoT requires the development of strategic policies, robust ethical and legal frameworks, and the establishment of sustainable technological infrastructures.

Keywords: Internet of things (IoT), smart education, artificial intelligent (AI), machine learning (ML), augmented and virtual reality (AR/VR), Blockchain.

ABSTRACT

The rapid advancement of artificial intelligence (AI) and its integration into education create new opportunities for teaching natural sciences, offering dynamic tools that enhance the learning process. This study explores the use of ChatGPT as a support tool for teaching the age of the Earth in secondary education. Specifically, it presents a teaching scenario that combines active inquiry, collaborative learning, and critical thinking, enabling students to interact with ChatGPT for searching, processing, and evaluating scientific information.

The methodology is based on a blended learning model, which combines traditional teaching with technology. In this approach, students formulate questions, analyze responses, and compare ChatGPT's information with established scientific sources. Additionally, the study investigates the challenges associated with AI use in education, such as the need for digital literacy, information reliability, and the role of teachers as mediators in the learning process. The proposed teaching scenario consists of three parts: 1. Introductory teaching, where fundamental concepts about the age of the Earth and scientific dating methods are presented. 2. Interaction with ChatGPT, where students organized into groups, pose questions, search for answers, and evaluate the information received. 3. Evaluation and feedback to compare learning progress and explore students' experience of using the tool.

The quantitative analysis of the research is based on the following data collection tools: Pre-test and post-test, measuring students' cognitive development before and after using ChatGPT. Likert-scale questionnaires to capture students' experience and their perception of the reliability and usefulness of such tools. Statistical data analysis, extracting conclusions about the effectiveness of integrating ChatGPT into teaching practices.

It was concluded that the use of ChatGPT enhanced learning engagement, encouraged an enquiry approach and the development of students' critical thinking. Through statistical analysis of the data, it was concluded that it improved the cognitive level and the degree of understanding of the concepts. However, it highlights the need for appropriate pedagogical guidance and educational policy to ensure the proper use of such AI tools in the educational process.

ABSTRACT

The COVID-19 pandemic provided (amongst its tragedy) a springboard of electronic existence for many aspects and functions of society. All possible constituents of operations, amidst lockdowns and social distancing, shifted their operations online. As such, education had to follow as well, with a high range of applicability and effectiveness, ranging from many best practices surfacing, but also many discrepancies, such as new ways to cheat, and laptops being logged into, yet unattended. The post-pandemic reality has left the world trying to mitigate and heal from many outcomes of the coronavirus, but at the same time, and especially with reference to the education sector, relinquishing a plethora of instruments that can be utilized in teaching, thus unravelling a novel range of possibilities, and opportunities, for education.

Many universities in the world where participation in class is not mandatory, are registering record-low numbers of attendance, to the point of creating two distinct segments of students and designating them as active and inactive. Simultaneously, the experience gathered from electronic means of learning can provide a readily available solution towards inclusiveness and boosting of participation, as well as continuity in teaching. Thereby the education sector has the potential to utilize tools for streaming lectures, recording them, and sharing them on privately and/or publicly accessible video/streaming platforms, yet the question surfaces as to how the issues arising may be mitigated, such as how personal data can be safeguarded, and at the same time attendance in class maximized, as distance and hybrid teaching technologies can be perceived as drawing students away from the classroom, thereby burdening the already problematic situation of low attendance.

In the plight for the utilization of technology in education, a plethora of instruments may be used, but at the same time the educational value that is carved in class must be upheld. This situation emerges as a dilemma since on the one hand technology may facilitate the streamlined delivery of the curriculum, enabling the attainment of the respective learning outcomes, yet it may be seen as a segue towards degradation of the class culture and interaction, thus maybe leading to an eventual drop in attendance. Herein lies the research gap and contribution of the present work. After the pandemic a reasonable question surfaces, as to the instruments that can be still usable to promote distance learning, hybrid classes, and the branding of education, that many educational institutions have been taking advantage of many years, even before the pandemic. Here, notable examples refer to, e.g., MIT OpenCourseWare (with 5.63 million subscribers and 7.5 thousand videos, where entire courses have been bundled in video lists and can be accessed free of charge), Harvard, Brown University, and many others, that are using technology as a means of promoting knowledge and their brand, while crucially, boosting attendance in class as well.

Insight as to the technologies that may revolutionize teaching hopefully will allow for higher engagement, but at the same time care must be given so that technology is not abused. With the help of artificial intelligence, this paper provides a framework of the most effective strategies that can boost attendance in the classroom in tandem with the use of distance learning, hybrid teaching, presenting, and collaborating, to create a toolkit for the utilization of technology in education that will abide by specific legislation governing synchronous and asynchronous learning, safeguard personal data, and at the same time boost in-class attendance. This research is important as it provides much needed focus and analysis for a topic requiring enrichment within its body of knowledge. The research focuses on tertiary education, but its results can be replicated in all arrays of teaching.

Keywords: tertiary education, hybrid teaching, education participation, e-learning, class attendance, inclusion in education.

FOSTERING PROBLEM-SOLVING IN STEM: A HANDS-ON AI-DRIVEN GAS DETECTOR PROJECT

ABSTRACT

This study explores the effectiveness of Problem-Based Learning (PBL) and Maker Education in enhancing problem-solving skills among secondary school students through the development of an AI-driven Gas Detector. By integrating Artificial Intelligence (AI) with hands-on STEM learning, this research provides practical insights into innovative educational approaches that encourage critical thinking and technical competency.

A mixed-methods approach was employed, involving 32 secondary students from Electrical, Electronics, and Automation engineering fields. Participants were categorized into three groups: Maker Learning (hands-on projects), Virtual Learning (simulations), and Classic Learning (traditional instruction). The study evaluated students' problem-solving attitudes using pre- and post-intervention assessments via the Problem-Solving Inventory and gathered qualitative insights through semi-structured interviews. While the small sample size limits broad generalization, the results provide meaningful insights into the effectiveness of AI-enhanced maker learning.

Findings indicate that while all groups showed improvements in problem-solving skills, the Maker Learning group exhibited the most significant advancements. Students reported high engagement levels and highlighted the real-world applicability of their learning experiences. Additionally, the study identified challenges such as resource constraints, instructor training, and the need for structured AI integration in educational settings. A more extensive analysis of the quantitative data is planned to strengthen the findings.

To enhance practical applicability, this presentation will include concrete examples of AI integration in the classroom, discuss best practices for implementation, and address potential challenges in scaling AI-driven maker projects. The discussion will provide educators and researchers with actionable insights for developing technology-driven, experiential learning activities in STEM curricula, with a focus on fostering both technical and soft skills in secondary education.

Keywords: Problem-Based Learning (PBL), Maker Education, STEM, Artificial Intelligence (AI), AI-driven Gas Detector.

CREATIVE STUDENTS OR CREATIVE CHATGPT? SECONDARY EDUCATION STUDENTS' PERCEPTIONS OF THE IMPACT OF GENERATIVE ARTIFICIAL INTELLIGENCE ON CREATIVE THINKING.

Giotakou Konstantina
Teacher of Greek Literature
2nd Protypo Gymnasium of Volos
Email: nadia_giotakou@yahoo.gr

ABSTRACT

A fundamental characteristic of human personality is creative thinking. Although humans are inherently creative beings, the extent to which this capacity develops largely depends on the degree of support provided by the sociocultural environment, including education. Cultivating creativity has become a primary objective for most educational systems in the 21st century. Nevertheless, schools in Greece appear to struggle with fostering the conditions necessary for students to think "outside the box." Empirical evidence suggests that creativity is enhanced through student engagement in creative writing processes, particularly when generative artificial intelligence is incorporated (AI), which opens new avenues in the complex process of writing. However, the integration of AI technology has also raised significant concerns, with many arguing that it may lead to dependency and, ultimately, to a weakening of the human element.

The aim of the present study is to investigate lower secondary school students' perceptions of the impact of artificial intelligence on creative thinking. Specifically, the study seeks to address the following research questions: 1) How do students evaluate the influence of artificial intelligence on creativity? 2) How do students perceive the appropriate use of artificial intelligence in cultivating creative thinking?

The present research adopts an exploratory, qualitative design with a phenomenological approach, aiming to understand the expectations and significance that students themselves attribute to artificial intelligence. Moreover, it is situated within the theoretical framework of self-determined learning and Vygotsky's sociocultural theory of cognitive development. Twenty lower secondary school students engaged in creative writing activities using ChatGPT. Given the limited existing knowledge regarding how students engage in creative writing with the assistance of writing tools and how instruction should be structured when using such tools, the lesson was designed as a workshop. It included specific learning objectives and activities aimed at the development of the cognitive skills of recall, understanding, application, analysis, and reflection. Upon completing the activities, participants assessed the creativity in their work using a rubric based on the criteria of imagery, voice, characters, and narrative (Mozaffari, 2013; Zedelius et al., 2018). They also completed an open-ended questionnaire and participated in focus groups.

The descriptive data were analyzed thematically and revealed that participants used AI to overcome challenges encountered during the writing process. With its assistance, they gained access to alternative ideas that nurtured divergent thinking and problem-solving skills, while also supporting emotional development through the satisfaction of psychological needs. However, the findings also indicated that not all students possessed the ability to critically evaluate outputs, generate original ideas, or maintain an authentic personal voice. A deeper understanding of the emerging potentials and limitations of AI could help educators design instruction more thoughtfully and adopt more effective strategies for enhancing creativity.

Keywords: creative thinking, artificial intelligence, student perceptions, secondary education

FOSTERING THE SOFT SKILL OF CRITICAL THINKING THROUGH AI IN PRIMARY EDUCATION

Michael Theodorou
Principal of the Primary School of Graikochori
Primary Education Directorate of Thesprotia - Greece

Principal of the Primary School of Asproklisi - Sagiada
Primary Education Directorate of Thesprotia - Greece
email: dgioka@sch.gr

ABSTRACT

This study explores the use of chatbots to foster the soft skill of critical thinking in upper primary school students. Teaching scenarios were designed across five subject areas (Language, History, Civics, Geography, and Skills Labs), utilizing a combination of three free tools: ChatGPT, Gemini 2.0 Flash, and Gemini 2.0 Flash Thinking. These scenarios were implemented in two primary schools in the region of Thesprotia, and the evaluation of the outcomes was conducted through semi-structured interviews with five educators.

The findings revealed that chatbots played a significant role in designing activities that enhance skills such as analyzing and comparing viewpoints, justifying or challenging opinions, identifying implicit messages and fake news, forming evidence-based judgments, and solving problems. Additionally, the tools generated innovative ideas that went beyond the educators' initial lesson plans.

However, limitations were observed regarding the accuracy of specific information during prompting, which was addressed through the complementary use of web searching. Overall, the study confirms the potential of AI tools as supportive mechanisms in educational practice, while also highlighting the need for critical digital literacy among both teachers and students. Lastly, the research lays the foundation for future, larger-scale programs framed within the Theory of Change.

Keywords: chatbots, fostering critical thinking, primary school

ABSTRACT

The project is a European initiative implemented on the ESEP platform during the 2024–2025 school year. Nineteen members from Greece, Turkey, Portugal, Italy, and Romania participate in the project. Its founders are the 23rd Kindergarten of Stavroupoli, Thessaloniki, and ICS di Scandale from San Mauro Marchesato, Italy.

The program focuses on the pedagogical use of Artificial Intelligence and its integration into existing learning environments and educational platforms. The starting point is a suitcase that is randomly found outside the kindergarten, filled with old photographs and personal objects belonging to a woman from an earlier era. The photographs serve as the trigger for beginning our journey—from old photographs to Artificial Intelligence. This journey introduces learners to the history of photography, black-and-white and color photography, portrait photography, street photography, and alternative forms of photography, aiming to cultivate empathy and sensitivity. These activities are combined with the possibilities offered by Artificial Intelligence tools for the enhancement, creation, editing, and transformation of images.

The Artificial Intelligence tools used in the project are the following:

ABSTRACT

The integration and application of Artificial Intelligence in recent years has been on an upward trajectory, affecting key pillars of the global economy. Its dynamic course has not left education unaffected, on the contrary, today there is a strong interest in its exploration. This research is a bibliographic article through which existing studies are utilized, with the aim of examining artificial intelligence in the field of education and more specifically identifying both its advantages and disadvantages. It is considered important to explore the field under consideration through the presence of applications such as ChatGPT and Gemini, which are frequently used by trainees.

The research findings help members of the educational community and the respective bodies to assess the necessity of a smooth transition to a new normality, ensuring every ethical issue. The rational use of ChatGPT and Gemini is essential to maintaining the balance between the dual relationship of instructor and trainee.

For the needs of this scientific work, the researchers used secondary research through the literature, which refers to a systematic method of review and critique regarding the scientific field under consideration, helping to identify current knowledge, gaps and future research directions. A systematic search was carried out in reputable databases, libraries, electronic repositories and other scientific sources to collect research on artificial intelligence in education with the ultimate goal of evaluating its advantages and disadvantages.

email: lapkl@yahoo.gr

ABSTRACT

The study examines the applications of Artificial Intelligence (AI) in primary education, focusing on improving the learning process, personalizing education, and supporting teachers. Through a literature review and analysis of existing applications, the main uses of AI are highlighted, including personalized learning, automated assessment, intelligent assistants, and educational games.

Particular emphasis is placed on AI's role in developing language skills ,integrating students with special with special needs, and creating interactive learning environments. As part of the study, a teaching scenario for sixth-grade students is presented, where AI tools such as ChatGPT, Language Tool , Book Creator and Imagine support the writing process, enhancing students' creativity and digital skills.

The findings indicate that AI contributes to differentiated learning, increased student engagement, and the development of 21 st-century skills. However, challenges such as ethical considerations, data privacy, and the teacher's role in AI-driven education are acknowledged. Despite these challenges ,AI in education offers significant opportunities for modernizing teaching practices and enriching the learning experience.

ABSTRACT

Nowadays, millions of students worldwide do not have a safe school environment, as in schools around the world children and adolescents learn to live in fear as a consequence of school bullying. The relevant study highlights the severity and complexity of the social phenomenon called school bullying. In the last decade, mainly as a result of rapid digitization, mobile applications and computers have had a decisive impact on children's lives as students live and learn through them to a significant extent. The aim of this study is to enhance our understanding of how smart, interactive technologies address learning and empower applications users in the fight against bullying.

Keywords: School bullying, artificial intelligence, anti-bullying applications.

ABSTRACT

The rapid advancement of Artificial intelligence (AI) has brought significant changes to the use of digital media in everyday education, introducing numerous opportunities as well as challenges that require further exploration regarding AI's role in teaching and learning. AI-powered tools are reshaping pedagogical approaches by enabling personalized learning experiences, intelligent teaching systems, and adaptive assessments. However, these developments raise concerns about data privacy and ethical dilemmas.

In Cyprus, the integration of AI into the educational system remains at an early stage, despite the growing desire and strong interest in improving teaching methods. This research examines both the perspectives of the global educational community and the level of familiarity of Cypriot educators in primary, secondary, and higher education regarding the potential integration of AI into the educational landscape. The questionnaire, completed by the stakeholders, highlights perceptions regarding the concept of AI, the level of familiarity with AI tools, the emotions triggered by a possible integration, and the degree of willingness to adopt AI in educational environments. Additionally, it includes questions about the advantages and disadvantages of AI tools in education. It is worth noting that many educators are concerned about whether the appropriate infrastructure for integrating such tools into educational settings currently exists or how soon it could be developed. Moreover, most educators wish to have the right to accept or reject AI integration, as they are the direct transmitters of knowledge.

The adoption of AI tools requires the proper preparation of educators, which underscores the urgent need for seminars and conferences where educators can share their perspectives, experiences, and concerns. The insights obtained from this research contribute to the broader dialogue on digital transformation in education, outlining strategic directions for the responsible and effective integration of AI into the educational system.

ABSTRACT

Artificial intelligence (AI) in education has evolved in recent years into one of the most dynamic and fast-growing research domains. Its increasing integration into educational processes has created new opportunities for innovation in teaching and learning, but also exposed issues including ethics, academic integrity, and effective pedagogy. This study conducts a comprehensive bibliometric analysis of global research activity on AI in education, aiming to map the evolution, emerging trends, key thematic clusters, and future directions of the field. The dataset comprises relevant publications indexed in the Scopus database from 2016 to 2024, analyzed using the Bibliometrix R and VOSviewer software. The findings indicated an exponential growth of academic interest in scientific interest after 2019, with dominant research themes such as applications of large language models (LLMs), AI ethics, learning personalization, and academic integrity. This research study contributes to a comprehensive understanding of the current research and to the formation of a contemporary view of the cognitive field, providing useful suggestions.

Keywords: Artificial intelligence, education, bibliometric analysis, Scopus database

PERCEPTIONS OF FUTURE EDUCATORS REGARDING THE UTILIZATION OF ARTIFICIAL INTELLIGENCE IN EDUCATION

Bassounas Athanasios
Educational Consultant in Informatics
Directorate of Secondary Education of Ioannina
e-mail: basounas@sch.gr

ABSTRACT

The utilization of Artificial Intelligence (AI) is one of the main fields of interest in the recent years, for both educators and educational researchers. The present study explores the perceptions of future educators regarding the potential of AI for both teachers and students, the challenges and risks associated with its use and the conditions necessary for the effective and beneficial integration of AI into all aspects of the learning process. The research was conducted among students of the Annual Pedagogical Training Program (E.P.PAI.K) of the Higher School of Pedagogical and Technological Education (A.S.PAI.T.E.), representing various fields and with various levels of teaching experience. These students are potential future educators in Primary and Secondary school education. Data collection was carried out using an anonymous online questionnaire with both closed (Likert scale) and open-ended questions. The questionnaire gathered demographic data, information on the technological proficiency of the students, their familiarity with digital technology and AI and its applications, their opinion regarding the use of AI by teachers and students and the consequences it may have and, finally, the prerequisites for effective and safe utilization.

The research findings indicate that the future educators are highly familiar with digital technology and particularly AI and they often use AI applications. They believe that AI can support educators in lesson planning, development of instructional material and as a means to attract and engage their students' attention. They also acknowledge that AI can be beneficial for students (to a lesser extent compared to teachers), mainly in familiarization with technology and knowledge acquisition. However, the participants of the study recognize risks and challenges associated with AI integration in education. A significant proportion of the respondents expressed their concern about that fact that AI could hinder and diminish students' critical thinking skills, as well as fostering dependence on technology and isolation from authentic human interactions. Other risks are plagiarism and intellectual property violation. Moreover, most future educators fear that AI might diminish the role of the teacher. Finally, nearly all future teachers emphasized the necessity of establishing clear policies for the ethical and effective use of AI in education. They also strongly advocated for systematic training and ongoing support to equip educators with the skills required in this evolving technological environment.

ABSTRACT

This study examines the scholarly output on digital career guidance and counselling through a quantitative bibliometric approach. A corpus of 167 publications from 1998 to early 2025 was analyzed using descriptive statistics, keyword co-occurrence, trend-topic methods, and thematic mapping to elucidate publication dynamics, author collaborations, and conceptual structures. Results show a stable annual publication rate, an average of 10.8 citations per document, and a mean of 3.7 authors per publication, with only 14.4% of papers involving international co-authorship. Journal articles emerged as the predominant dissemination venue, supplemented by conference proceedings and book chapters. Trend-topic analysis reveals an intellectual progression from institutional and infrastructure concerns (2001–2005), through e-learning and computer-assisted instruction (2005–2012), to sector-specific applications in medical education (2010–2014), culminating in recent interest in affective, motivational, and artificial-intelligence paradigms (2022–2023). Thematic mapping identifies *humans*, *mentoring*, and the *internet* as well-developed (motor) themes, while AI-related terms and chatbots emerge as new topics. These findings delineate a mature research domain with shifting thematic emphases. Future studies may advance global collaboration, examine the ethical dimensions of AI-mediated counseling tools, and address digital inequities within career guidance systems.

ABSTRACT

Learning disabilities are a neurodevelopmental disorder that affects a significant percentage of students worldwide, creating academic and socioemotional challenges that can impact adulthood. Although learning disabilities cannot be fully resolved, individuals living with them can significantly enhance their abilities with the help of appropriate teaching methods and support tools. Early detection of learning disabilities and provision of appropriate intervention are paramount not only to support students with learning disabilities in addressing their academic needs but also to enhance their social and emotional well-being, their proper development and their quality of life. Artificial intelligence offers innovative capabilities to support students with learning disabilities by providing personalized digital tools and learning strategies tailored to their specific educational needs. The aim of this study is to examine, through a systematic literature review, the most recent applications of artificial intelligence that have been developed to support students with learning disabilities and their effectiveness in improving their academic performance. Through the literature search in the Scopus, PubMed, and Google Scholar databases, a limited number of studies were identified regarding the role of artificial intelligence in the education of students with learning disabilities. However, the aforementioned studies demonstrated that artificial intelligence can enhance the educational path of individuals with learning disabilities and facilitate the learning process, improving their academic performance, reducing the challenges and inequalities they face and thereby providing equal opportunities for success in the educational field. The systematic review of the existing literature, combined with the findings of the study, highlights significant gaps and needs in the integration of artificial intelligence in the education of students with learning difficulties. Specifically, for the further development of artificial intelligence in education, it is essential that applications focusing on the learning needs of school- aged students with learning disabilities and not only university students with learning disabilities be developed. Additionally, the research primarily focuses on dyslexia, leaving other learning difficulties unexplored, highlighting the need for further studies. Moreover, the lack of research regarding teachers' perceptions underscores the necessity of investigating their role in the integration of artificial intelligence into teaching. Finally, it is recommended that further research be conducted on existing applications with a view to improving personalization algorithms and ensuring optimal performance in the education of students with learning disabilities.

Keywords: Artificial intelligence, learning disabilities, personalized learning, digital tools, learning strategies, personalized interventions.

ARTIFICIAL INTELLIGENCE IN EDUCATION POSSIBLE OBSTACLES AND RISKS

Petsiou Charikleia
Education Consultant for Mathematics
Secondary Education Directorate of Ioannina
Ioannina, Greece
e-mail: harapetsiou@yahoo.gr

ABSTRACT

When integrating Artificial Intelligence (AI) into the field of education, various challenges and potential threats are likely to arise. Despite the promising potential of AI, its reckless application carries significant risks. The main areas of concern include dilemmas such as algorithmic bias, lack of transparency, privacy, human communication and the development of critical thinking. In addition, there are practical obstacles related to the logistical infrastructure and teacher training.

The research approach of the paper is qualitative and is based on semi-structured interviews with 23 primary and secondary education teachers from various parts of Greece, of various specialties, who have experience with popular AI chatbots. Concerns related to misinformation, role distortion and student dependence on AI systems were highlighted. The research concludes that there is a need for a prudent and responsible approach to the adoption of AI, accompanied by the formulation of appropriate policies and guidelines, in order to maximize the benefits and minimize the negative impacts.

ABSTRACT

This paper explores the comparative potential of two digital approaches in the learning process: traditional information search and the use of prompts in artificial intelligence language models. Focusing on classroom applications, it examines how these practices affect cognitive engagement, the development of 21st-century skills, and students' and teachers' attitudes toward knowledge.

By drawing on case studies from teaching Computer Science, Mathematics, and Environmental Education, the study highlights the opportunities and limitations of each approach. The methodology combines qualitative analysis of AI-integrated teaching scenarios with a systematic review of peer-reviewed academic literature.

Findings reveal that traditional search demands strong filtering and source evaluation skills, yet it is time-consuming and prone to misinformation. Prompting, in contrast, delivers immediate, personalized, and explanatory responses, fostering inquiry and metacognition. However, overreliance on AI-generated content can hinder learner autonomy.

The study concludes that a blended pedagogical approach is most effective. It recommends integrating both search and prompting practices within thoughtful, digitally supported educational frameworks that empower students as critical and creative knowledge constructors.

ABSTRACT

This paper presents the methodology, results, and ongoing work of the AISE project (Artificial Intelligent platform to support Students by assessing their performance skills through predictive models created from their writing skills), funded under the Erasmus+ program. The project aims to apply state-of-the-art AI methods, especially retrieval-augmented generation (RAG) combined with Large Language Models (LLMs), for the automatic evaluation of student essays across three dimensions: Content, Organization, and Language. Essays were collected from secondary education students in Greece, Cyprus, Serbia, and Croatia, processed, and assessed using a modular AI pipeline. The results demonstrate high alignment with human ratings, especially in the Content dimension, while highlighting challenges in assessing linguistic subtleties. The AISE project paves the way for scalable, transparent, and personalized feedback systems in educational environments.

Department of Accounting and Finance, University of Ioannina
Preveza, Greece
e-mail: phadgop@uoi.gr

ABSTRACT

This paper focuses on the role of AI as a valuable tool in English language learning, assisting teachers in their multifaceted roles. Generative AI can assist in the creation of vocabulary/grammar/speaking exercises or dialogues (in an "open" curriculum), or the adaptation of existing ones (in "fixed" curricula), based on the teaching situation and learners' profiles. However, it is important to state that AI-assisted activities need to conform to methodological criteria. The AIATAC framework was inspired by the fact that trainee English teachers at Master's level at the Hellenic Open University reported using AI to design image-enhanced task sheets, as part of their lesson planning. Content analysis of such lesson plans was conducted, and the results were evaluated as positively correlated with increased student motivation and participation in class. Subsequently, the AIATAC framework was conceptualized as a result of the realistic need to extend and apply AI-assisted task adaptation or creation, in a principled manner, conforming to the methodology of the teaching of English as a Foreign Language. The AIATAC framework can also be applied to the teaching of English for Specific/Academic Purposes (ESP/EAP) or even EMI (English as a Medium of Instruction). This possibility is currently under consideration at the University of Ioannina, as part of teaching ESP at the Department of Accounting and Finance, which involves integrating AI into the synchronous (class/IT lab) and asynchronous (self-study/ecourse) components, using generic or more specific AI applications. The AIATAC framework can best be implemented in a laboratory with the required equipment, offering students access to applications and online tools. In the paper, it is analyzed how this pilot framework can be used in a methodologically appropriate way.

Keywords: English language teaching, generative AI, context-specific, task creation/adaptation, AIATAC framework.

COMPARATIVE USABILITY EVALUATION OF MECHATRONIC SYSTEMS

Apostolos Tsagaris
International Hellenic University
Thessaloniki, Greece
e-mail: tsagaris@gmail.com

Maria Chatzikyrkou
International Hellenic University
Thessaloniki, Greece
e-mail: maria.chatzikyrkou@gmail.com

ABSTRACT

This paper studies the interaction of children aged 5-12 years with a modern mechatronic system by comparing the results obtained from three usability assessment tools. The mechatronic system is an autonomous robotic vehicle that was built with the help of the Lego Mindstorms EV3 Education educational package. The construction is used by 100 children aged 5-12 years in three scenarios of different difficulty and then each of these children answers three questionnaires. The first questionnaire that assesses usability is the SUS (System Usability Scale) and consists of 10 questions, the second is the USE (Usefulness, Satisfaction, Ease of Use) which consists of 30 questions which are divided into four sections and assess usefulness, ease of use, ease of learning and satisfaction respectively. The third questionnaire was created and adopted from previous research (Tsagaris, 2023) and consists of 20 questions divided into four sections assessing effectiveness, efficiency, satisfaction and ease of use.

The survey included a sample of 100 children, aged 5-12 years (5-6 48%, 7-8 26%, 9-10 16%, 11-12 10%), of whom 84% were boys and 16% were girls, of whom 48% reside in western Thessaloniki and 52% reside outside Thessaloniki. From the results of the first questionnaire (SUS), one concludes that the use of the mechatronics system creates the will for frequent use (94% Agree), is not complicated (80% Agree), exudes confidence during use (98% Agree) is easy to learn (70% Agree), and that for the younger ages of 5-6 years, unlike children 11-12 years, the assistance of a technician is required to use it.

According to the results of the second questionnaire (USE), in its first section assessing Usability, 92% agree that it helps them be more efficient, 98% agree that it is useful and 98% also agree that it does everything they expected it to do. In its second section assessing Ease of Use, 92% say that it is easy to use, 94% agree that it is user-friendly, 96% state that it is flexible and that they can recover from mistakes quickly and easily. In its third section assessing Ease of Learning, 90% easily remember how to use it and 80% state that it is easy to learn and use. The fourth and final section of the second questionnaire assesses Satisfaction, with 100% stating that they are happy with the interface, 96% saying they would recommend it to a friend and 98% saying it is great.

As for the third questionnaire, in the first five questions assessing Effectiveness, 96% disagree that mistakes are made during interaction, while 100% agree that the interface works as expected. In its second section, which concerns Efficiency, 100% agree that interaction is easy and 92% agree that there is freedom of movement for the user. Satisfaction is what is assessed in the third section of the questionnaire, with 100% agreeing that operating the system is not tiring and that changing the command is easy, while in the fourth section, which assesses Ease of Use, 96% state that it is flexible in selecting movements, 100% that the commands are memorable, and that training is easy.

Wedosave: FORGOTTENBABYSYNDROME – ROBOTIC LIFE PROTECTION SYSTEM AGAINST FORGOTTEN BABY SYNDROME

Nikolaos Avgoulas
Computer Science Teacher PE86
Deputy Principal of the 11th Primary School of Kalamaria
e-mail: navgou11dim@gmail.com

ABSTRACT

Wedosave: ForgottenBabySyndrome is a robotic application designed and programmed by the 6th-grade students of the 11th Primary School of Kalamaria. It includes appropriate automation to prevent incidents of Forgotten Baby Syndrome.

The project lasted six weeks, during which the students became familiar with the MICROBIT microcontroller and its programming environment. They worked in groups of four and followed targeted activities aimed at understanding how the device functions and exploring its capabilities to solve the given problem.

Forgotten Baby Syndrome refers to situations in which a driver accompanying a minor — especially an infant — may forget the child's presence in the car cabin and leave, placing the child in a hazardous environment, particularly during the summer months.

The robotic setup includes weight sensors fitted to the child's seat and a temperature sensor for measuring the interior temperature of the vehicle. There are also alerting devices such as a mobile phone and smart watch to notify the guardian, along with mechanisms to activate the car alarm so that a passerby may help remove the child from the vehicle and bring them to a cooler environment.

Additionally, an automated mechanism was constructed to open a window and allow fresh air to cool the child until the guardian or a passerby can intervene and remove the child from danger.

All the components — such as the window mechanism, sensors, and alert systems — are built using Microbits, which communicate with each other via radio waves.

Wedosave offered multiple educational benefits as it was based on: · Constructivism, as students documented, designed, built, and analyzed various aspects of the problem-solving process.

- Collaborative learning, as they worked in teams of 3 to 4, · Interdisciplinary approach, incorporating knowledge from physics and electric circuits, biology, and the human body's cooling mechanisms.
- Project-based learning, progressing through various stages (design, analysis, construction, and presentation).
- Personalized learning, as students could choose which part of the project they wanted to focus on more.

Due to the significant impact of Wedosave, apart from its presentation at the Student IT Conference of the Regional Directorate of Central Macedonia and the Student Robotics Festival of the Experimental High School of the University of Macedonia and the Secondary Education Robotics Festival of the Prefecture of Pella, the students also had the opportunity to give interviews to various media outlets, gaining experience and confidence in their efforts and abilities.

Keywords: Forgotten Baby Syndrome, STEM, Microbit, robotics, programming.

INTEGRATING ALGORITHMIC THINKING AND PROGRAMMING INTO SECONDARY EDUCATION THROUGH EDUCATIONAL ROBOTICS: A CASE STUDY BASED ON THE NEW GREEK CURRICULUM OF IEP

Angelos Rondogiannis
Computer Science & Music Educator (PE86 – TE16)
Department of Computer Science Education,
2nd Experimental General Lyceum of Lefkada, Greece
email: arondo@sch.gr

ABSTRACT

This article presents a case study exploring the integration of algorithmic thinking and programming in upper secondary education through educational robotics. The intervention is grounded in the new national Informatics curriculum developed by the Greek Institute of Educational Policy (IEP), focusing on the thematic area "Algorithmic Thinking – Programming of Computing Systems" and specifically the sub-topic "Programming of Robots and Hardware."

Through a scenario based on the use of Arduino microcontrollers and simulation platforms such as Tinkercad, students were guided in constructing and programming automated systems. The approach blends simulation with physical computing, fostering students' engagement with real-world technological applications. Emphasis was placed on constructivist and experiential learning, collaborative project work, and the cultivation of core digital skills.

The study was implemented during the 2023–2024 academic year with 11th-grade students, highlighting increased engagement, improved programming literacy, and enhanced problem-solving and collaborative abilities. Findings suggest that educational robotics serves as a powerful medium for delivering key computing concepts while promoting creative and critical thinking.

CROCUS CULTIVATION ALGORITHM – EXPLORING NATURE'S STEPS THROUGH PROGRAMMING

Antigoni Tsirou
Computer Science Teacher, MSc
Directorate of Primary Education of Kozani, Hellenic Ministry of Education and Religious Affairs
Kozani, Greece
e-mail: tsirouant@gmail.com

ABSTRACT

The project titled "Crocus Cultivation Algorithm – Exploring Nature's Steps through Programming" presents an innovative teaching approach for primary school students that combines programming with the exploration of natural phenomena. The core focus is the development of algorithmic thinking through experiential, visual, and tactile learning, using a digital layout that depicts the stages of saffron (Crocus Kozanis) cultivation.

Drawing on her experience in computer science, the educator designed and printed a visual layout illustrating each cultivation stage of the crocus plant. When placed on a classroom table, students are prompted to identify the specific stage indicated by the teacher and construct the corresponding algorithm. Before programming the Bee-Bot robot, the teacher introduces command cards (created by herself) that represent movements such as "forward," "backward," "right," "left," "pause," "start," and "reset." These cards are arranged sequentially next to the layout, offering a visual representation of the steps required for cultivation.

The methodology is implemented through hands-on activities that actively engage students in designing and executing the algorithm with the robot. Beyond enhancing technical skills, the activity fosters critical thinking and collaboration. The key findings indicate that linking theoretical knowledge with practical application through experiential learning improves students' understanding of algorithmic concepts and promotes teamwork.

Moreover, results show that the use of visual and tactile tools contributes to creating an engaging learning environment where students develop problem-solving skills and gain confidence in applying technological solutions. This approach enables learners to connect natural processes with programming, highlighting the importance of sequence and structure in a multidimensional learning context. Additional observations confirm the method's positive impact on creativity and educational outcomes.

Keywords: algorithmic thinking, programming, experiential learning, visual learning, tactile learning, collaboration, crocus cultivation.

TA15: Gamification in education

STUDY OF THE EFFECTIVENESS OF INNOVATIVE TEACHING INTERVENTIONS FOR LEARNING THE BOHR ATOMIC MODEL AND THE PERIODIC TABLE

Adramerina Aikaterini
PhD Candidate
Department of Chemistry, Aristotle University of Thessaloniki
Thessaloniki, Greece
email: katerinaadra@gmail.com

Koutalas Vasilios
Laboratory Teaching Staff
Department of Chemistry, Aristotle University of Thessaloniki
Thessaloniki, Greece
email: bkoutalas@chem.auth.gr

Charistos Nikolaos
Assistant Professor
Department of Chemistry, Aristotle University of Thessaloniki
Thessaloniki, Greece
email: nicharis@chem.auth.gr

ABSTRACT

Topics such as Bohr's Atomic Model and the organization of elements in the Periodic Table continue to pose considerable challenges in the teaching of Chemistry, particularly for students in the first year of upper secondary education. In response to this pedagogical difficulty, the present study explores the impact of alternative teaching strategies compared to traditional instruction, employing digital interactive environments, tabletop educational games, and robotic systems. It examines the extent to which these approaches contribute to students' conceptual understanding of Bohr's Atomic Model and the Periodic Table and enhance their active engagement in the learning process. The research design was structured in two phases, beginning with a pilot implementation for the refinement and adjustment of the tools, followed by the main. Analysis of both quantitative and qualitative data reveals that game-based strategies significantly enhance not only cognitive achievement but also students' participation compared to traditional instruction. Although the robotics-based intervention was promising, it did not yield similarly high learning gains. These findings underscore the need to redefine Chemistry instruction by adopting teaching models that respond to diverse student learning styles. The comparison of these innovative interventions with traditional instruction reveals clear differences in both performance and motivation, offering valuable research-based insights for the transformation of Chemistry teaching practices.

Keywords: Chemistry, gamification, instructional interventions, digital tools, robotics, Bohr's Atomic Model.

LEARNING ABOUT THE MACEDONIAN STRUGGLE

Maria Kikidou
School Principal, English Language Teacher

President of the Yessios Museum (NPO)
Edessa, Greece
Email: contact@yessiosmuseum.com

Design, implementation, and evaluation of educational museum programs has been a core priority for the Urban Non-Profit Organization "Yessios Museum - The Macedonian Struggle and Edessa."

More specifically, within a multisensory environment—the Museum's galleries—and an interactive educational framework that utilizes and highlights the value of New Technologies (ICT) and Web 2.0 tools, an initiative was undertaken to promote the cultural skills of secondary school students. This was achieved through engagement with the museum's collection, local history, and cultural heritage.

The design of the educational program "Learning about the Macedonian students aged 13–17, was based on various methods, techniques, approaches, and environments. Particular emphasis was placed on the principles of the game-based learning approach (Domnus, 2010); consequently, a digital educational escape room was developed. The design followed the three fundamental stages of the task-based learning approach—pre-task, main task, and post-task (Willis, 1996). Furthermore, the program incorporated alternative evaluation methods to record the emotional engagement of the participating students.

Keywords: game-based learning, museum educational programs, educational escape rooms.

DESIGN AND DEVELOPMENT OF A VIRTUAL REALITY EDUCATIONAL APPLICATION FOR THE TEACHING OF "DE STIJL" DESIGN MOVEMENENT

e-mail: pkyratsis@uowm.gr

ABSTRACT

This case study is part of a broader research project of the University of Western Macedonia that concerns the combination of innovative technological tools and educational methods in order to improve learning outcomes and enhance the learning process.

The research was conducted at the Department of Product and Systems Design Engineering and focuses on the design and development of a digital application in a virtual reality environment, aiming to work as a supportive educational tool for the teaching of design movements. The proposed application introduces virtual reality technology to educate students of the department on the De Stijl design movement. The educational process is enhanced by utilizing game-based learning strategies that serve specific educational goals. The final application resembles a virtual reality game, based on the logic of educational escape rooms. The educational content is harmoniously integrated into the overall design of the application, through the creation of specially designed quizzes and puzzles that users are required to solve. The ultimate goal is for students, through interaction with objects in the virtual environment, to become familiar and better understand key historical facts, aesthetic criteria and the main design principles of the design movement

The application was designed according to a methodological framework that adopts elements from design thinking and creative process for the development of new products. The design was guided by the potential use of virtual reality technology and the integration of gamification as a basic learning method.

The application was tested on the premises of the faculty. The early evaluation process involved an initial sample of 8 students of the department. The methodology followed included the completion of questionnaires and the answering of knowledge-based questions related to the educational subject, before and after using the application. The results showed a significant improvement in learning outcomes regarding student performance. Out of a total of 10 questions, the average number of correct answers was 6.63 before using the application and 9.00 after its use (increase of 35.75%). There was also an increase in students' positive opinion on the integration of virtual reality technology into the learning process, before and after using the application (increase of 15.15%) as well as their opinion on educational games (increase of 8.82%). Regarding the overall experience, the results showed that students evaluated their experience with the application very positively, with an average score of 4.5 (90%) on the 5-point Likert scale. As for the excitement factor, students rated it at 4.38 (87.50%). In terms of how motivating and engaging the experience felt, the rating was 4.63 (92.50%).

Overall, the initial evaluation findings show a highly encouraging prospect for creating an engaging educational experience that significantly stimulates students' interest and enthusiasm for the educational subject. This study is expected to contribute to the ongoing research in the field of technological advancements and the implementation of innovative practices in educational settings, aiming to optimize the learning experience and learning outcomes. It explores and proposes creative ways to combine immersion technology tools with game-based learning methodologies while focusing on specific educational goals.

Keywords: Learning methodologies, immersive technologies, virtual reality, gamification, product design.

WHEN HISTORY BECOMES A GAME: UTILIZING ARTIFICIAL INTELLIGENCE AND GAMIFICATION IN HISTORY TEACHING.

Dr. Evángelos Sitas
Teacher PE02
1o Junior High School - DSE Aitolokarnanias, Greece
e-mail: vagsit@gmail.com

ABSTRACT

Most students have always maintained that History is a difficult subject, and that success comes through memorization of the curriculum. This paper proposes a new approach that aims to improve student engagement by freeing them from the shackles of frontal narration and memorization. We will propose methods for integrating AI into gamified teaching activities and examine whether the use of these mechanisms can improve student engagement and cognitive performance compared to traditional teaching methods.

Initially, the students' needs were analyzed, and the educational objectives were determined. Then the gamified activities were designed. With the help of artificial intelligence, we adapted and improved the existing activities. Two groups of students participated in the research and their division into an experimental group and a control group was done randomly. We compared the results of the groups using diagnostic and final assessments. The pilot implementation showed increased engagement and improved student performance compared to traditional methods.

In recent years, gamification has emerged as a modern pedagogical approach, which in its simplest version, using challenges, rewards and leaderboards, has been shown to improve the learning experience. Today, artificial intelligence is perhaps one of the biggest trends in the field of digital technology and is increasingly evolving as the technology of the future, revolutionizing both the way we teach and the way we learn. The combination of these two can offer significant benefits to education in general and to the teaching of history in particular.

Λέξεις – κλειδιά: gamification, artificial intelligence, history teaching, innovative pedagogies.

GAMIFICATION AND DIGITAL STORYTELLING AS TOOLS FOR DEVELOPING SCREENING ACTIVITIES FOR PRAGMATIC DEFICITS IN CHILDREN

Koskeridou Marina

e-mail: toki@uoi.gr

ABSTRACT

Pragmatic skills are fundamental for children's social interaction and academic success. Traditional screening methods can be unengaging for young learners, prompting interest in digital, game-based alternatives. This study explores the feasibility of the digital activities, combining gamification and digital storytelling, as a screening tool for pragmatic deficits in primary school children.

We designed and developed the interactive digital activities using PowerPoint, integrating narrative elements and game mechanics to assess various aspects of pragmatic competence. Six children aged 8–12 years participated, each with parental written consent. Individual sessions were conducted in supportive environments, and usability, engagement, and overall experience were evaluated through structured interviews.

Children responded positively to the digital activities, reporting high levels of interest and engagement. Most found the interface intuitive and the activities enjoyable, especially the interactive dialogue component. Minor technical or usability issues were noted by a few participants, but did not detract significantly from the experience.

Initial findings of this study suggest that a digital activities format may offer a child-friendly, engaging approach for preliminary screening of pragmatic skills. As this was a feasibility study with a small, non-clinical sample, further research with larger and more diverse groups is required to validate the tool's effectiveness and expand its application in educational and clinical settings.

Keywords: Pragmatics, interactive screening, feasibility study, gamification, digital storytelling, children

GAMIFICATION IN SECONDARY EDUCATION: BENEFITS, IMPLEMENTATION AND CHALLENGES

Chatziantonakis Dimitrios
Secondary Education Teacher, PE 82. Ms, Med.
1st Vocational High School of Nea Ionia, Volos, Greece
e-mail: dxatzh@gmail.com

ABSTRACT

Modern educators constantly seek innovative teaching approaches that enhance the learning process and engage students. One of the most widely adopted techniques is gamification, which incorporates game elements, mechanisms, and characteristics into non-game contexts. Through the use of badges, points, leaderboards, and challenges, gamification aims to increase student participation, boost motivation, and improve interactivity in the educational process. In secondary education, the implementation of gamification can contribute to the creation of a more engaging learning environment, enhancing both student involvement and teaching effectiveness. At the same time, educators tend to have a positive attitude toward its application, recognizing the benefits of its integration.

This study focuses on the applications of gamification in secondary education in Greece, examining both the benefits and challenges associated with its implementation. Initially, a literature review was conducted, analyzing research studies and articles that present gamification applications in secondary education, both in general and special education settings. The findings highlight the advantages and potential of gamification in diverse learning environments, demonstrating its association with increased student engagement, higher learning motivation, and improved interaction between students and teachers.

Subsequently, a quantitative study was conducted through a questionnaire survey involving 45 secondary education teachers from various disciplines in the Magnesia and Larissa regional education departments. The objective of the study was to identify the main challenges that educators face when implementing gamification in their teaching practices. The findings reveal that despite educators' positive attitudes, significant barriers hinder the adoption of gamification. Specifically, the key obstacles identified include the lack of teacher training, insufficient technological infrastructure, large class sizes, and limited instructional time.

The study concludes that the successful integration of gamification in secondary education requires institutional support, an upgrade of school infrastructure, and targeted teacher training. These factors are essential to fully harness the potential of this technique for the benefit of the learning process.

ABSTRACT

This paper presents an innovative educational software, D_Read-Narrate, designed to support the language, reading and narrative skills of monolingual but mainly bilingual children (8-12 years old) attending Greek public primary schools. As part of the D_Read-Narrate project, software was developed using parts of iRead, an already developed software (https://iread-project.eu/) under the Horizon 2020 funding program to promote the reading skills of students with dyslexia, beginning readers and students learning English as a foreign language. Our aim is to present the design of the software and how it works and to analyze an exemplary lesson plan for its use in educational practice. This software was developed in the framework of the project: "Digital applications for teaching reading and narrative skills in multilingual Greek primary school classes D_READ-NARRATE". This project is carried out within the framework of the National Recovery and Resilience Plan Greece 2.0, funded by the European Union – NextGenerationEU (Implementation body: HFRI). It aims to develop a set of educational web applications that improve the language skills of primary school students learning Greek as a second language (L2). The software includes educational tools (digital classrooms, assessment, assignment of tasks), language assessment software before, during and after use, and student profiles with stored performance data and personalized feedback. From March 2025, the software will be used in public primary schools with reception classes and in schools with many bilingual pupils (e.g. schools for intercultural education) to evaluate its effectiveness.

ABSTRACT

This paper is focused on the teaching of fundamental concepts of Data Structures and Algorithms through the development of an interactive Virtual Reality (VR) educational environment. The aim is to enhance conceptual understanding through experiential and experimental interaction, leveraging the capabilities of VR technology.

Virtual AlgoLab is an educational VR game, implemented on the Unity platform, which includes a virtual space with four independent minigames. Each minigame has been designed to reflect and highlight a fundamental concept of computer science: linked lists, nodes, Hamilton cycles, and binary search. The user interface is ergonomic and simplified, with the aim of supporting navigation by novice users with no previous experience in VR systems.

The game's functionality focuses on actively engaging users through navigation, selection, and interaction with objects and concepts that correspond to algorithmic processes or data structures. The design was based on pedagogical principles of active learning and conceptual transfer in digital environments.

To assess the effectiveness of the game in achieving its purpose, tests were conducted with elementary school students and university students. It was observed that VR Algolabs successfully attracts the interest of all age groups, while users who evaluated it did not have any difficulty in understanding the objective and theoretical background of each minigame.

ABSTRACT

The integration of virtual laboratories (VLs) into secondary STEM (Science, Technology, Engineering, and Mathematics) education is transforming traditional teaching practices by providing interactive, cost-effective, and flexible learning environments. This study investigates the instructional approaches, benefits, challenges, and prospects of VLs in enhancing scientific learning. VLs simulate real lab environments, enabling students to conduct experiments digitally, manipulate variables, and visualize complex phenomena—promoting engagement, motivation, and inquiry-based learning. Despite their advantages, limitations such as the lack of tactile experience, the need for teacher training, curriculum alignment, and digital access disparities remain significant. A blended learning approach combining physical and virtual labs is recommended to ensure comprehensive skill development. With emerging technologies like AI, augmented reality, and collaborative platforms, the future of VLs in secondary STEM education appears promising. Overall, VLs have the potential to play a critical role in preparing students for higher STEM education by fostering conceptual understanding and essential 21st-century skills.

ABSTRACT

Distance examinations, introduced during the COVID-19 pandemic and still in use at the Hellenic Open University (HOU), constitute a process that requires continuous redefinition. These examinations not only introduce new challenges but also demand alternative assessment strategies to ensure the validity and reliability of results. Key issues include student identification and invigilation processes, the selection of exam formats and questions, and the alignment of these with learning objectives.

In this context, technology has played a pivotal role in this transformation, integrating tools such as similarity detection software (Turnitin) and specialized invigilation systems. At the same time, the emergence of Artificial Intelligence (AI) amplifies these challenges, requiring more sophisticated approaches to prevent non-authentic student participation. For instance, the Open-book examinations, widely adopted in the Master's Program Education & Technologies in Distance Teaching and Learning Systems – Educational Sciences (ETA), highlight critical thinking as the primary factor of evaluation. Focusing on these skills constitutes a cornerstone of the educational process and reflects contemporary requirements.

The paper aims to present and systematically analyze the implemented processes, highlighting both benefits and challenges through the case study of the HOU Master's Program 'Education & Technologies in Distance Teaching and Learning Systems – Educational Sciences (ETA)'. Furthermore, it discusses the evolution of assessment methods, emphasizing the importance of ensuring that students engage meaningfully and demonstrate the knowledge and skills acquired during their courses.

Methodologically, this paper examines the assessment practices applied in the HOU Master's Program ETA between 2020 and 2025, covering eleven semesters. It explores exam design and evaluation strategies and the way they aligned with technological and pedagogical advances. The study investigates how instructors adapt to the integration of tools such as Turnitin to prevent plagiarism, and AI applications to promote authentic student engagement. Furthermore, the implementation of some of the practices adopted within the framework of the format of these distance exams is being investigated.

email: siliatrv@gmail.com

ABSTRACT

Specific Learning Disabilities (SLDs) are neurodevelopmental disorders that affect core academic skills, making the implementation of individualized and inclusive educational approaches essential. The integration of digital technologies into contemporary educational practice, particularly during and after the COVID-19 pandemic, has introduced new opportunities for supporting students with SLDs, while simultaneously revealing persistent inequalities related to access and pedagogical use of digital tools.

The aim of this study is to examine the effectiveness of digital technologies in supporting students with SLDs and to critically explore the challenges associated with digital accessibility and educational inclusion. Methodologically, the study is based on a systematic review and secondary analysis of data drawn from international reports published by organizations such as UNESCO, the OECD, and the European Commission during the period 2020–2023, adopting a comparative perspective across different categories of SLDs.

The findings indicate higher levels of adoption and technological maturity for digital interventions targeting dyslexia compared to other learning difficulties, such as dyscalculia. At the same time, a significant digital divide and a lack of specialized teacher training are identified in the Greek educational context when compared to other Western countries. Overall, the study highlights the need for a comprehensive digital strategy grounded in the principles of Universal Design for Learning, aiming to ensure equitable access and meaningful educational inclusion for all students with Specific Learning Disabilities.

Keywords: Specific Learning Disabilities; digital technologies; digital divide; distance education; inclusion

TA18: Social networks and education

SOCIAL NETWORK AND EDUCATION

Koulis Ioannis
Director of the 9th Primary School of Arta
Directorate of Primary Education of Arta
Greece
e-mail: janniskoulis@gmail.com

ABSTRACT

Social networking platforms have become an integral part of contemporary life, influencing nearly all sectors, including education. Their incorporation into the educational process has opened new horizons, while at the same time posing significant challenges. The present paper aims to examine this relationship, analyze the relevant legal framework, and propose guidelines for the appropriate use of social networks within the educational environment.

More specifically, the rapid advancement of technology and the widespread integration of digital platforms into everyday life have transformed the ways in which individuals learn, communicate, and collaborate. Within the educational context, social networks offer opportunities for interactive learning, collaboration, and access to rich educational resources. However, their use is not without risks. Issues such as privacy protection, data security, cyberbullying, and the need for digital literacy constitute major concerns that require careful consideration and effective management.

For this reason, the paper explores both the opportunities and the challenges arising from the use of social networking platforms in education. Its objective is to highlight how these platforms can enhance the learning process, facilitate communication between students and educators, and promote innovation in teaching practices. At the same time, the legal and ethical dimensions of social media use are examined, with particular emphasis on the protection of students' personal data and rights.

The discussion also focuses on the responsible use of social networks, proposing guidelines and good practices that can be adopted by educators and educational institutions. Emphasis is placed on the benefits of digital literacy, the importance of raising students' awareness of online risks, and the role of educators as mentors in the digital era. Furthermore, the paper investigates how social networks can contribute to the development of a more inclusive and equitable educational system by providing access to knowledge and resources for students from diverse social and geographical backgrounds.

In conclusion, this paper seeks to offer a comprehensive approach to the relationship between social networks and education, combining theoretical analysis, practical applications, and legal perspectives. Through collective reflection and the exchange of ideas, it aims to outline a roadmap for the safe, responsible, and effective use of social networking platforms in education, for the benefit of both students and the educational community as a whole.

EXPLORING THE INNOVATION OF HARVARD'S "OUT OF EDEN LEARN" ONLINE LEARNING PLATFORM: A CASE STUDY IN A PRIMARY EFL CLASSROOM

Dermitzaki Kyriaki
English Language Teacher, M.Ed.
4th Primary School of Preveza
Preveza, Greece
e-mail: kdermitz@gmail.com

ABSTRACT

The emergence of new technologies and their infinite applications in all aspects of our lives, have affected the educational systems globally. In the Greek state school context many educators feel that the time has come to embrace new media pedagogies in their everyday lessons, not as a mere technological tool, but as a vehicle to amend their teaching approaches, promoting continuous professional development among fellow teachers and 21st century competences among students through their inspiring collaboration in Communities of Practice and Learning. The present study discusses the design, implementation and evaluation of our engagement in the English language classroom of the 4th Primary School of Preveza with the unique online learning community of "Out Of Eden Learn" (OOEL) of Project Zero in the Graduate School of Education in the University of Harvard. More specifically, the results of our participation in the various learning journeys designed by the Harvard researchers team since our initial "Skills Labs" pilot phase in 2020 on a national level and the international collaborations in the following years, revealed very positive results of students' intrinsic motivation enhancement as well as promotion of multiliteracies, fostering inclusive, digital and critical thinking skills in an interconnected, culturally and linguistically rich learning environment.

ABSTRACT

This study examines the implementation of RQDA, an open-source software for qualitative text analysis, in the systematic analysis of educational counseling sessions. Eight recorded sessions, each approximately one hour in duration, were transcribed, imported into RQDA, and systematically organized through the software's project interface. Inductive thematic coding produced five types of visualizations: code frequency bar charts, thematic maps, code co-occurrence networks, verbal tree diagrams, and word clouds. The qualitative thematic analysis showed that the sections concerning the implementation of an action plan, the provision of information, and timely response accounted for over 85% of all codings, highlighting the dominant emphasis on practical guidance and real-time support. Less frequent codes, such as listening skills, relationship building, and emotional reassurance, highlighted secondary emotional dimensions. Co-occurrence networks confirmed strong relationships between action planning and information sharing, while word visualizations revealed recurring linguistic patterns of collaborative decision-making. The results demonstrate the ability of RQDA to enhance the transparency and repeatability of qualitative analysis, as well as to be effectively integrated into statistical procedures in mixed-methods research. Within the framework of future studies, it would be advisable to adopt mixed-method designs, combining in-depth qualitative data with quantitative measurements, to deepen the understanding of counseling processes and enhance methodological rigor.

Keywords: RQDA, Qualitative Analysis, Open Source Software Tools, Educational Consulting

VISUALIZATION OF PHYSICAL QUANTITIES OF ELECTROSTATIC FIELD, SPATIOTEMPORAL VARIATIONS OF WAVES, ATOMIC ORBITALS, AND DETERMINATION OF FUNCTIONAL CHARACTERISTICS OF CIRCUITS THROUGH SOFTWARE

Varsamis Agisilaos
Teacher of Physics (M.Sc., Ph.D.), Header of School Physics Laboratory
6th General Lyceum of Larissa
Larissa, Hellas (Greece)
e-mail: avars@sch.gr

ABSTRACT

The purpose of this work is to demonstrate the usefulness of scientific software in understanding, calculating and deepening the concepts of the physical sciences, through combinatorial and animated visualizations. It is particularly important especially for physical quantities and concepts that are abstract and there is no direct supervision over them (e.g., the field quantities, atomic and wave phenomena). All of the above is done with the using of the MAPLE and MATCAD software. Additionally, a powerful alternative proposal for the study of electrical circuits is given through the TINA simulation software in relation to the classical laboratory and its effectiveness is demonstrated, especially in cases where the laboratory activity cannot be carried out due to endogenous problems.

In the first part of the paper, the characteristic physical quantities of the electrostatic field are created and depicted, such as the intensity, the equipotential curves or surfaces, dynamic lines in two and three dimensions for a single charge, as well as, for a combination of charges.

In the second part of the paper, wave phenomena are presented in the plane and in space, such as the spatiotemporal propagation of a wave of constant amplitude, but also with damping, the spatiotemporal production of a standing wave, the spatiotemporal production and evolution of beats and waves interference.

In the third part of the paper, atomic orbitals are produced and designed. The atomic orbitals s, p, d, f and the hybrid sp^2 are depicted in the plane and in space, as well as, density diagrams and various sections of them in space.

In the last part of the paper, the study of electrical and by extension electronic circuits is presented, through the POSTPROCESSING feature of the electrical and electronic circuit simulation software TINA.

Keywords: Electrostatic Field, Waves, Atomic Orbits, Electrical Circuits.

EDUCATION AND DIGITAL MEDIA- INSPIRATION FOR THE IONIAN POET THROUGH "KALLIPATEIRA"

Giannouli Sofia
Philologist, PE02 (Secondary Education Teacher)
1st Model Junior High School of Preveza with Lyceum Classes
Preveza, Greece
e-mail: alexandropoulosalekos@yahoo.com

ABSTRACT

This paper examines the application of innovative pedagogical approaches in Ancient Greek language instruction, focusing on the combined use of traditional teaching and digital tools for the analysis of Pausanias' text "Kallipateira" and Lorentzos Mavilis' poem, also titled "Kallipateira."

The aim of this work is to highlight how modern technology can be integrated into the teaching of Ancient Greek, enhancing the learning experience and broadening the possibilities of understanding ancient texts. Specifically, it seeks to present how digital tools and artificial intelligence contribute to the analysis, comprehension, and retention of literature, while simultaneously strengthening students' cognitive skills.

The objective is to explore the synergistic use of traditional teaching methods with contemporary technology to bolster the learning process and underscore the significance of digital technology in modern education. The integration of technological tools, such as artificial intelligence (AI), chatbots, and text analyzers, offers personalized explanations and facilitates the understanding of the historical and literary elements of the works. This approach not only enhances text comprehension but also contributes to the development of critical thinking and the strengthening of students' digital literacy.

The application of Howard Gardner's Theory of Multiple Intelligences through digital tools fostered the development of various types of intelligence, enhancing students' linguistic, logical-mathematical, spatial, social, and intrapersonal intelligences. Specifically, tools like Google Docs strengthened linguistic intelligence, Google Sheets and Excel enhanced logical-mathematical intelligence, while Google Earth contributed to the development of spatial intelligence. Collaborative learning through tools such as Padlet and Trello enhanced social intelligence, promoting students' collaborative skills. Concurrently, reflective tools like Mind Maps and Journals strengthened intrapersonal intelligence, fostering personal reflection and self-awareness. The use of tools such as PowerPoint for presentation, the internet for research, and e-Class for managing and monitoring the learning process strengthened students' digital skills, offering a comprehensive and contemporary approach to learning. This implementation of innovative technologies highlights the importance of digital technology in education, broadening learning opportunities and preparing students for their future in the digital world.

Keywords: Ancient Greek, Kallipateira, Literature, Digital Media.

TEACHING HISTORY USING DIGITAL MEDIA: PRESENTATION OF A TEACHING PLAN

ABSTRACT

Teaching history is a particular pedagogical challenge, requiring critical thinking, interpretation of historical sources, and connecting the past and present. The use of digital media provides new opportunities in this direction, making historical knowledge more interactive and accessible to students.

The integration of technology into history education includes the use of interactive maps, virtual representations, multimedia material, digital archives, and educational platforms. These tools allow students to explore historical events through visualised data, analyse primary sources and participate in experiential activities. For example, geographic information systems (GIS) and applications such as Google Earth enable historical mapping, facilitating understanding of the spatiotemporal context of events. In addition, virtual and augmented reality (VR/AR) technologies enable "digital visits" to historical sites, enhancing the experiential approach to history.

Multimedia stuff, like documentaries, interactive videos, and historical archives, offers a multimodal teaching approach that meets different learning needs. At the same time, digital storytelling enhances students' creative participation, allowing them to construct their own historical narratives by combining sources, images, and videos.

Gamification is another innovative teaching mechanism, as it incorporates elements of challenge, reward, and collaboration. Platforms such as Kahoot!, Quizizz, and Mission US allow historical knowledge to be assimilated through interactive activities, increasing students' interest.

Despite the possibilities offered by technology, there are challenges that require careful management. The reliability of digital sources, the development of a critical approach to information, and the training of teachers in the use of digital tools are key factors for the successful integration of technology into history teaching.

In conclusion, the use of digital media in teaching history is not simply a technological modernisation, but a pedagogical upgrade that enhances critical thinking, experiential learning and a deeper understanding of the historical past. With the proper use of these tools, history becomes more accessible and appealing, shaping active and conscious citizens.

This paper examines the role of digital technologies in teaching history, focusing on contemporary methods that utilize interactive maps, virtual representations, multimedia material, and gamification tools through the presentation of a two-hour teaching plan for a sixth-grade history class on the topic: "The second siege and the exodus of Messolonghi."

The integration of digital technologies into the teaching of the module contributed significantly to strengthening historical thinking and active student participation. The use of interactive maps and virtual representations facilitated understanding of the spatiotemporal context of events, while multimedia material and digital storytelling promoted experiential and creative learning. In addition, the use of gamified activities enhanced interest and content assimilation. At the same time, students developed critical analysis skills for digital sources. However, challenges emerged related to the management of teaching time and the need for systematic training of teachers in the use of digital media.

Keywords: history teaching, digital media, interactive learning, virtual representations, gamification, technology in education

THE VIDEO COURSE AS A MEANS OF TEACHING AND ASSESSMENT IN VOCATIONAL EDUCATION. DESIGN AND IMPLEMENTATION OF A VIDEO COURSE IN VOCATIONAL HIGH SCHOOL COURSES

ABSTRACT

This paper provides an in-depth exploration of the video lesson as an essential digital teaching and assessment tool in vocational education. It advocates for the integration of video lessons by VET teachers, emphasizing their potential to enhance existing educational practices.

The paper presents a range of software options for creating video lessons, showcasing their versatility and pedagogical advantages while acknowledging challenges such as potential technical issues and the necessity for adequate training. The development of a video lesson is demonstrated using the Ted Ed platform, which enables educators to create interactive lessons by embedding questions and educational resources directly within the video content.

The study examines two video lessons designed for Vocational High School students: one focused on "Oral Hygiene" and the other on "Automotive Engine Cooling Systems." This methodology allows teachers to evaluate students' progress and engagement while also facilitating self-assessment for the students themselves. Feedback was collected through a questionnaire completed by students after the lessons, providing valuable insights into the effectiveness of this teaching approach and points for improvement. The conclusions underscore the significance of video lessons in vocational education and affirm their efficacy as a teaching tool.

THE INFLUENCE OF CHARLES BAUDELAIRE ON THE POEMS: "ITHACA" BY C.P. CAVAFY AND "JOURNEY TO KYTHERA" BY KOSTAS OURANIS THROUGH DIGITAL STORYTELLING

Dr. Kopsaris Kosmas
Director of the 2nd Gymnasium of Preveza
e-mail: kkopsaris@hotmail.com

ABSTRACT

The aim of this specific presentation is to detect and capture the intertextual aspects of Baudelairean poetry in emerging Greek poets through digital storytelling. Initially, the importance of storytelling, its contribution to the educational process, as well as the basic elements that govern narratology will be explained. The basic principles of digital storytelling, the stages of its creation in relation to the learning benefits at the level of recruitment will be examined.Methodological tools for utilizing digital storytelling will be presented, with the main goal of students acquiring an expansive perspective and understanding of literature at a comparative and intertextual level. Emphasis will be placed on the selection of appropriate digital tools that highlight the idea of the journey to utopia as a key means of visual storytelling with strong cinematic resonances. The concept of travel is catalytic as a motif for activating creative imagination. On this basis, Baudelairean poetry launched ground probes into the activation of the invisible mechanisms that hold the cosmic order together. Baudelaire's constant echo is evident in modern and postmodern Greek poetry in issues related to escape to the hereafter as a non-place, constituting a potential field of alternative experience of being. Baudelaire poetically marked the eternal transition within the crowd. He determined the destiny of modern man, condemned to the vigorous struggle of opposing forces, to the border between light and darkness, to the search for inner fullness and emptiness, to the claim of a smooth tomorrow that would counteract the collapse into the depths of existence. Through digital storytelling in literature, students will be able to assimilate in a highly creative way the importance of travel as a means of inner search and at the same time familiarization at the level of external reality with hitherto unexplored fields. The impact of digital storytelling on poetry marks the activation of the magic of poetic images to the fullest, creating a unique poetics of technology. The expected goals of this specific presentation are related to cultivating a broad perspective in students and, at the same time, familiarizing them with poetry as a timeless field of inspiration.

Keywords: digital storytelling, narratology, iconographic storytelling.

THE APPLICATION OF DIGITAL MEANS FOR DISTANCE TEACHING OF TECHNICAL SUBJECTS: APPLICATION STUDY FOR ROAD DESIGN COURSE

ABSTRACT

Distance learning and the examination of higher education courses are challenging tasks for both teachers and students. The qualitative and quantitative characteristics of the information to be communicated make the investigation and use of the most appropriate digital media necessary. In addition, the reduced and sometimes non-existent interaction between teachers and students and the limited, therefore, feedback throughout the educational process require the implementation of innovative teaching procedures. The recent mandatory implementation of all teaching activities in higher education and not only because of the pandemic, has highlighted the weakness of the system of teachers and digital media in order to maintain a level of study equal to that prevailing in the pre-pandemic era. At the same time, however, it was also an opportunity, especially because of the extended duration of distance education, to develop tools and procedures that will be able to offer an increased level of knowledge at any time. Besides, the realization of distance education in secondary education in the event of an extraordinary or unforeseen event has recently been legislated by the Ministry of Education, Religious Affairs and sports as well as the possibility of distance training in higher vocational schools (former Institute of Vocational Training (IVT)). In higher education, distance assessment of students under conditions has been in force for three years, which was recently applied in many universities during the final exams of the fall semester of the academic year 2023-2024. It is therefore possible that distance learning will be repeated in the future and hence it is necessary to look for methods that will deliver the expected result.

This paper describes how the educational process was covered, including the final assessment of students, in the context of a higher education course taught at the Department of Civil Engineering of the University of Thessaly and related to the Highway Engineering. This course is included in the study guides of the Departments of civil and rural and surveying engineering both in Greece and abroad. Both the technical means and the methodology applied throughout the academic semesters are analyzed and statistics on student performance are presented before and during the period of the distance learning process. It is worth noting that within the framework of this course the students developed a particularly demanding semester theme concerning the integrated study of a road project with weekly progress monitoring sessions and strict intermediate progress dates using a design program.

The research showed that during distance learning, the initial interest in developing the semiannual theme was high but fewer students than in other years completed it. In addition, during the first distance examination period, the percentage of successful students was particularly high, which decreased to pre-pandemic levels in the following examination periods.

The project aspires, among other things, to contribute to those fellow teachers who seek an effective process of distance delivery of lessons and conducting examinations using digital media. What has also been shown in the context of the research is that with the available digital media in universities, the levels of knowledge offered both qualitatively and quantitatively during the distance and in-person teaching and examination of this course and others with similar requirements and way of teaching, based on the percentage of students who received a promoted degree, may be similar.

Keywords: Distance teaching, distance evaluation, semester theme, digital media.

ORGANIZING THE MUSIC LESSON WITH PADLET

Michailidou Matina
Music Science Educator
6th Junior High School of Kozani
Kozani, Greece
email: tiniomi22@gmail.com

ABSTRACT

The integration of digital technologies into teaching practices constitutes an integral part of modern educational reality, offering new possibilities for organizing and enriching the learning process. In this context, the present work focuses on the use of the digital platform Padlet as a tool for managing and enhancing the teaching of Music in secondary education.

Padlet is an interactive online application that allows the creation of collaborative digital boards, where teachers and students can post multimedia content such as texts, images, videos, and audio files. The flexibility of this tool makes it particularly suitable for the Music course, as it enables the creation of collective projects, the posting of student recordings, the exploration of musical genres, and collaboration in compositional and analytical musical tasks.

Specifically, this work presents best practices for utilizing Padlet in Music teaching, with an emphasis on the creation of interactive activities (interactive maps of musical genres, posting of recordings and exchange of opinions, collaborative music composition, research projects on composers and musical movements, creation of interactive quizzes and games, analysis of musical works and listening with comments, digital portfolios of music assignments, creation of an electronic classroom), all of which enhance the learning experience.

The prerequisites for creating a Padlet by the teacher involve setting up an account on the platform through registration with an email or via a Google/Microsoft account, selecting the appropriate plan (free or premium version), connecting with students (access via invitation code, link, or integration into a learning management system, e.g., Google Classroom, Microsoft Teams), setting privacy and collaboration preferences (public, password-protected, private), and adapting the layout (various formats such as grid, timeline, map) to fit the needs of the lesson.

The use of Padlet in the Music classroom provides a dynamic and collaborative approach to learning, enhancing student engagement and fostering creativity and critical thinking. Moreover, the use of multimedia content allows the adaptation of instruction to different learning styles, facilitating differentiation and personalization of the educational process.

This work will present the Padlets that have been created in recent years for the needs of the Music course in all three grades of Junior High School. Each academic year, every class has its own Padlet, where data related to the annual project and weekly teaching content is posted.

Padlet is a particularly useful digital tool for organizing the Music course, allowing the development of a more participatory and creative educational experience. Through the presentation of these best practices, the importance of integrating digital technologies into teaching practices is highlighted, contributing to the shaping of a modern and effective learning environment.

Keywords: teaching, Music lesson, digital tools, Padlet

SOPHOCLES' ANTIGONE IN PRESCHOOL EDUCATION: DIGITAL TOOLS AND PEDAGOGICAL APPROACHES.

Papageorgiou Foteini
Early Childhood Educator, MSc
Eighth Nursery School of Ioannina

Damani Aikaterini
Educator PE 60,MSc, Phd
Primary Education Consultant of Arta

ABSTRACT

Ancient Tragedies in preschool education can be an important teaching tool. Teachers must integrate them into everyday educational life and incorporate them into the curriculum. The benefits of Drama, as a teaching method, are multiple. First of all, Drama can offer teachers the opportunity to reach students who have difficulty following the educational process, which is based on traditional methods, increasing their interest in what is happening in the classroom. In addition, it has been shown that it connects students with themselves and others, transforms the traditional learning environment and challenges students to approach knowledge in a different, multi-sensory way, which integrates students as a whole within the educational process and utilizes knowledge, experiences, and emotions throughout the process. Emotion, which is at the heart of drama, is often ignored in education. However, an educational process that relies only on logic and isolates emotion cannot offer students a holistic cognitive act and, by extension, a holistic education.

This paper focuses on investigating the role that Sophocles' Antigone approach can play in Preschool Education, utilizing digital tools to enhance the learning experience. The aim is to highlight the values of the play – Free Will, Religion and its relationship with the City, Unwritten Divine Laws, Justice, Duty, Love – and to search for teaching practices for teaching them to preschool children. The methodology of the work is based on the use of digital tools, such as interactive presentations with images, videos and audio, digital games that enhance the understanding of the values of the play, as well as applications such as Puppet Pals and Toontastic, which allow children to create and narrate their own versions of the story. In addition, digital design is utilized as a tool of expression and reflection, giving children the opportunity to visually capture their ideas and feelings. The findings of the study show that the integration of digital tools in the teaching of Antigone in preschool education enhances children's active participation, promotes creative thinking and facilitates the understanding of abstract concepts. The results highlight the importance of interactive learning and the use of technology in shaping an attractive and pedagogically effective teaching environment.

THE CORRELATION BETWEEN DIGITAL LITERACY AND COMMUNICATIVE LANGUAGE ACTIONS IN FOREIGN LANGUAGE LEARNING. GERMAN LANGUAGE: EXAMPLES FROM TEACHING PRACTICE WITH PRIMARY SCHOOL STUDENTS

Dr Papadimitriou Evangelia
Senior Fellow Teacher
University of Thessaly
Volos, Greece
email: evpap@uth.gr

Harmanta Argyroula-Arietta
German language Teacher in primary education
Halkida , Evia
email: ariettaharma@gmail.com

ABSTRACT

Teaching of foreign languages has been significantly transformed by the Common European Framework of Reference for Languages (CEFR), which is an international guideline that categorizes language proficiency into three main levels: A (basic user), B (independent user), and C (proficient user). It also defines learning outcomes as can- do-statements at the end of a learning process. Consequently foreign language educators can structure their teaching focusing on the learning objectives, learning strategies and assessment, which are defined by descriptors of communicative activities at each proficiency level. According to Common European Framework of Reference for Languages, which prioritizes learning outcomes approach and diverse methodological strategies, foreign language teachers have the flexibility to continually update and enrich course content focusing on applied communication and on the individual learner's interests, needs and achievements.

Therefore, in the last few years integrating digital literacy into everyday communicative and linguistic activities has become essential. The updated CEFR (2020) includes learning outcomes related to digital competencies. Given that digital tools also shape and transform students' social and educational environment, it is important for teaching to explore key questions such as: How does the integration of digital tools support the alignment of digital activities with learning objectives and the development of personalized learning in foreign language education? How can digital tools, (for example educational platforms or interactive games) can promote metacognitive skills like self-regulated learning or self-assessment? How can language teachers use these tools to support effectively differentiated instruction or blended and distance learning? In what ways can digital literacy increase student interaction, collaborative learning in foreign language teaching?

The presentation will conclude with concrete examples showcasing their implementation of digital tools in German language teaching to 5th-grade students at Level A (Beginners).

Keywords: German language, primary school, digital literacy, communicative language activities, digital competencies, differentiated instruction.

DIGITAL PATHWAYS TO ANTIQUITY: TEACHING ANCIENT GREEK THROUGH EPIGRAPHY AND EDUCATIONAL TECHNOLOGY

Rosidou Dimitra
Philologist, M.A. in Language Teaching and New Technologies in Language Communication and M.A in Ancient Greek Philology. Member of DiGIA research project.
Aristotle University of Thessaloniki
Thessaloniki, Greece
email: rosidoudimitra@gmail.com

ABSTRACT

In recent years, there has been a growing scholarly interest in examining both educators' and students' attitudes toward Classical Studies, as well as the impact of using technological tools—such as educational applications, digital educational games, software, and other platforms—in the teaching of philological subjects. This interest arises from the observation that students often show low motivation for learning Ancient Greek language and literature. It has long been acknowledged—over the past five decades—that the integration of *Information and Communication Technologies* (ICT) into educational systems offers multiple benefits, but also presents notable challenges.

The theoretical framework of this study is based on the view that the engaging environment of digital games and the flexible learning environment enabled by successful ICT integration can serve as sources of learning motivation.

This paper focuses on the potential use of digital media in teaching the Ancient Greek language, aiming to familiarize students with both the language and the culture through the study of Ancient Greek inscriptions. Without such inscriptions, our understanding of ancient Greek civilization would be incomplete and potentially distorted, as literary and historical texts alone cannot fully capture the complexity of the ancient Greek world.

Inscriptions, as primary and direct sources, provide invaluable information and are often preserved in better condition than other written records due to the durability of the materials on which they were inscribed. Ancient Greek epigraphy, more specifically, concerns the study of inscriptions written in the Greek language and alphabet on hard materials such as stone, marble, pottery, wood, bone, or metal.

The aim of this study is to demonstrate how digital tools can facilitate access to and interpretation of inscriptions, thereby enhancing students' engagement with the Ancient Greek language and deepening their connection to the ancient world.

The methodology follows a multidimensional approach, combining theoretical research with practical application. Initially, a literature review was conducted on the teaching of Ancient Greek and the use of digital media. Subsequently, an educational program was designed and implemented, focusing on the development of digital learning objects—such as the *Phrasikleia*—which can be adapted for use at all levels of education, including university students of Philology. These activities are carried out within the framework of the DiGIA research project, based in the Department of Philology at Aristotle University of Thessaloniki.

Through interactive engagement, students develop critical thinking and linguistic skills, while gaining a deeper appreciation of the historical and cultural significance of inscriptions. At the same time, direct contact with authentic epigraphic material opens up new pedagogical possibilities, making the study of Ancient Greek more accessible and engaging.

Keywords: Ancient Greek epigraphy, Ancient Greek language, digital learning object

USE OF DIGITAL TOOLS IN EDUCATION

Vasiliki Sarkatzi
Mathematics Teacher (PE03), Informatics Teacher (PE86), MEd, MSc
Principal of the 3rd General Lyceum of Trikala "Odysseas Elytis"
Trikala, Greece
email: sarkatzikiki@gmail.com

ABSTRACT

The paper addresses the integration of digital tools in education and how they influence teaching and learning. The introduction highlights the use of digital tools such as educational platforms (e.g. Google Classroom), interactive courses (e.g. Kahoot!), educational videos (e.g. YouTube), and collaboration tools (e.g. Microsoft Teams). These tools enhance learning, facilitate communication and collaboration, and enable personalized learning experiences for each student.

In the literature review, the paper analyzes the role of Information Technology and ICT in education. It refers to the need for students to acquire basic knowledge about technology and ICT, while at the same time developing critical thinking and social behavior skills. Despite students' familiarity with digital technologies, research data shows that students do not fully utilize the potential of ICT in the learning process. Therefore, education must incorporate activities that enhance critical thinking and problem-solving skills.

The paper also examines the learning theories that influence the integration of ICT in the educational process, such as behaviorism and constructivism.. It also presents the evolution of the integration of ICT in education, from the use of mass media to their full integration into the educational process.

A significant part of the paper concerns Mobile Learning (m-learning), which uses portable devices such as mobile phones and tablets to support learning, while highlighting the importance of collaboration, critical thinking and lifelong learning. It is characterized by interactive elements, personal adaptation and immediate feedback, enhancing the effectiveness and interaction in the learning process. Finally, the paper refers to the use of Artificial Intelligence (AI) in education, which offers personalized learning experiences and supports the educational process with the help of algorithms and neural networks.

Overall, the integration of digital tools and ICT in education offers many possibilities for improving teaching and learning, but requires a careful approach to their effective utilization.

ABSTRACT

The increasing use of educational videos in teaching creates new challenges and opportunities for improving the learning process. Automated summaries of educational videos, based on machine learning algorithms, offer an innovative tool that can be utilized for enhancing comprehension, student self-assessment, and feedback from educators. This work explores the ways in which automated summarization of educational videos can contribute to the more effective organization of the educational process.

The integration of educational videos in teaching may have helped educators; however, their comprehension can be demanding at times, particularly when the content is technical or of long duration. Automated summarization of a video can provide students with a brief and comprehensive presentation of its main points, facilitating information absorption and reducing cognitive load. Additionally, students can use the summaries for previewing content before viewing or for quick review after video completion, thus enhancing comprehension and memorization of basic concepts. We must not forget that students live in an era of rapid technological development and in the age of "speed" where they are bombarded daily with dozens of brief pieces of information in text format (Twitter) and video (shorts, TikTok). A relatively short summary of an educational video, beyond its educational nature, appears to better match the information pattern that students receive daily, making it more accessible and attractive compared to a long-duration video.

The main benefits for students include quick material review as well as better understanding of key points. Comparing an automated summary with the summary that students have created on the same topic can help them identify any oversights, misunderstandings, or gaps in their comprehension. This process enhances their metacognitive skills and helps them become more autonomous in their learning. They can also utilize summaries to quickly review the basic points of a chapter before examinations.

From the educators' perspective, automated summaries can be utilized as a feedback tool or for personalizing instruction. Educators can review the generated summaries to identify which video points challenge students and adjust their teaching approach accordingly. Furthermore, the ability to generate summaries at different levels of detail allows for differentiated instruction, responding to the needs of students with different levels of comprehension, different readiness levels, different interests, and generally different learning profiles. Another important application concerns accessibility. Automated summaries can support students with learning difficulties or those who prefer written information over auditory information, especially when the video is in a foreign language and subtitles can be incorporated into the summary. By providing a concise version of educational content, students can better understand key points, even if they struggle with direct processing of spoken language. Additionally, both students and educators can quickly identify the most important points of a video, save time, and improve the learning experience. For summary extraction, software (Chasanis et al., 2014) was used on educational videos from the Electrical Engineering Department and the Health Department, and overall student acceptance exceeded 80%.

In conclusion, automated generation of educational video summaries constitutes a powerful tool that can enhance the educational process on multiple levels. It helps students organize knowledge, self-assess, and improve their skills, while simultaneously offering educators useful means of feedback and instructional differentiation. The integration of these tools in modern education can lead to a more flexible, effective, and accessible learning environment.

Keywords: video summarization, educational video, self-assessment

TA25: Digital storytelling in teaching practice

THE CONTRIBUTION OF DIGITAL STORYTELLING TO LITERATURE IN SECONDARY EDUCATION: THE CASE OF THE PLATONIC ALLEGORY OF THE CAVE

Dr. Kopsaris Kosmas
Director of the 2nd Gymnasium of Preveza
e-mail: kkopsaris@hotmail.com

ABSTRACT

The aim of this specific presentation is to convey the catalytic concepts that underlie the allegory of the cave through digital storytelling. Initially, an overview will be given of the importance of literary education in the 21st century, as well as the importance of literature in the modern era as a means of utilizing new literacies. Reference will be made to the extent to which digital storytelling can contribute to the familiarization, creative deepening and assimilation of themes governed by strong conceptual divisions, such as knowledge-ignorance, light-darkness, bonds-freedom, theoretical life as opposed to active-practical life. The role of students in the design and successful implementation of this specific educational scenario will be emphasized. The Platonic myth of the cave constitutes an inexhaustible reservoir of inspiration for modern creators. Methodologically, digital storytelling is applied during the reading phase of the allegory and at a second level in the post-reading phase so that students can make complex critical associations and intertextual approaches. For a diagnostic approach through digital storytelling, students were assigned tasks, such as constructing a timeline capturing the stages of disengagement using the online tool timerime or creating a multimedia poster using the online tools popplet or glogster.

On this basis, the retelling of the Platonic allegory of the cave through the tools of digital storytelling contributed significantly to the students' understanding of its difficult philosophical concepts, making philosophical narrative more understandable and contributing to the consolidation of the concept of representation in literature, as well as more specific narrative means and techniques, such as dialogue or imitation.

At the same time, digital exploitation through this specific case is useful for understanding the deeper and universal meanings inherent in Plato's allegory of the cave as a literary genre that communicates with numerous works of modern literature. Therefore, the Platonic echo is related to the possibility of self-realization when the current reality crushes self-activity and heterodetermines the individual. Through a digital narrative, students, like every reader, have the opportunity to be initiated into the sanctuaries of Plato's cave, following the prisoners on the uphill path towards the freedom of existence. This implies that through a digital representation, students are able to internalize and fully grasp a theoretical model that may seem particularly difficult and inaccessible to them.

In summary, through digital tools, students become active markers of a represented story, they experience the Platonic allegory, having the sense of a personal contribution to the transition of the prisoners from darkness to light. The philosophical journey thus turns into a personal journey to the full knowledge of the cosmic mechanism as the missing point and at the same time the ultimate goal of the Platonic allegory of the cave.

Keywords: digital storytelling, Platonic allegory

DIGITAL STORYTELLING AS A CRUCIAL PEDAGOGICAL FRAMEWORK FOR ENHANCING THE FUNCTIONAL MANAGEMENT OF FRIENDLY RELATIONSHIPS IN STUDENTS FROM A SPECIAL PRIMARY SCHOOL

ABSTRACT

Storytelling is a fundamental dimension of human culture. It is a natural way of communicating and organizing experiences over time. Its power lies in its ability to evoke emotions, because it inspires the imagination, attracting more and better interest than any other form of information. Particularly, in the educational context, storytelling helps students to express themselves better, to develop their imagination and vocabulary, as well as facilitating the externalization of emotions, the development of empathy, critical thinking, and social skills.

Digital storytelling employs multimedia applications, such as text, sounds, music, comics and video. Over the past 25 years, it has evolved into a particularly powerful cognitive tool and teaching medium. By combining the ancient art of storytelling with the capabilities of technology, it provides a multi-sensory learning environment. In Special Education, digital storytelling contributes to the activation of interest and the facilitation of the achievement of learning objectives, constituting an important teaching and learning tool, especially in language instruction.

This paper presents a teaching proposal based on a digital fairy tale entitled “Two friends, what friends!”, which was designed and authored by a Special School teacher, for students with disabilities and/or special educational needs. Through the study of this specific story, students are given the opportunity to develop their linguistic and social awareness, as well as to learn about the true human wealth, by highlighting the high values of friendship, acceptance and mutual support. Given that students in Special Schools have difficulty making friends, such interventions are considered necessary for their integration, their healthy social development, as well as for their overall development as active and equal citizens.

Keywords: Digital storytelling, friendship, Special Education

DIGITAL STORYTELLING AS A TOOL FOR CULTIVATING CRITICAL THINKING IN STUDENTS

Dr Ntoka Aglaia
Supervisor of Quality in Education, DIPE of Arta
Consultant for Primary Education
Primary Education Directorate of Arta

ABSTRACT

This literature review examines in depth the relationship between digital storytelling and the development of critical thinking in students. The aim of this study is to highlight how the creation, analysis, and evaluation of digital narratives can significantly enhance students' ability to assess information critically, formulate valid arguments, and solve complex problems creatively.

The methodology followed is based on a systematic literature review, with selection criteria including relevance to the field of digital storytelling and critical thinking, publication in reputable scientific journals, and the chronological proximity of the studies (last decade). The sources include theoretical articles, empirical studies, and meta-analyses focusing on the educational applications of digital storytelling.

This review covers a wide range of research studies and examines the applications of digital storytelling in various educational settings, from primary to higher education. It delves into the challenges and opportunities arising from the integration of digital storytelling into educational practice, as well as its impact on the development of 21st-century skills, such as collaboration, communication, and creativity.

Among the key thematic areas analyzed are the precise definition and fundamental characteristics of digital storytelling, the theoretical frameworks linking storytelling to critical thinking, specific applications of digital storytelling in education, the tools and techniques used for creating and analyzing digital stories, and the outcomes of digital storytelling in developing critical thinking skills. Additionally, challenges and recommendations for the effective integration of digital storytelling in education are explored.

The contribution of this review lies in highlighting both the key findings of existing research and the existing gaps. Specifically, it is found that digital storytelling positively impacts critical thinking, but more empirical studies are needed to examine its long-term effects and its adaptation to different educational environments.

In summary, this literature review concludes that digital storytelling is a highly promising tool for fostering critical thinking in students. The creation and analysis of digital stories can significantly enhance active learning, collaboration, and the development of skills essential for success in the modern digital world. The effective integration of digital storytelling in education requires appropriate training and support for educators, access to modern technological tools, and the creation of a supportive learning environment that encourages innovation and creativity.

ABSTRACT

Today's children live in a digital world and new technologies are an important element of children's culture. Prensky (2006) used the term "digital natives" to refer to today's children who speak the digital language of computers, video games and the internet. In contrast, those who were not born in the digital age are considered "digital immigrants" because they have adopted many aspects of ICT, just like those who learn a second language later in life. (Nikolopoulou, 2018).

In the context of education, the benefits of digital technology are particularly emphasized, as computers offer children access to new, unknown worlds and stimulate their thirst for learning.

A special place in the field of preschool education and Special Education is occupied by storytelling, which effectively contributes to learning. After all, learning is effective when it is offered to children in a multimodal, enjoyable and entertaining way.

With the emergence of new technologies, a new form of storytelling was created, digital storytelling (Digital Story telling), from which children derive many benefits, acquire further skills and not just a simple acquaintance and familiarity with computers. They interact with their classmates, creating relationships of intimacy and trust, express themselves creatively and acquire digital skills.

TA26: Educational assessment using digital media and tools

THE USE OF EYE-TRACKING TECHNOLOGY FOR THE ASSESSMENT OF PRAGMATIC SKILLS IN CHILDREN: A SYSTEMATIC REVIEW

Gargala Vasileia
PhD Candidate,
Department of Speech and Language Therapy,
University of Ioannina,
University Campus B', 45500, Ioannina, Greece
e-mail: v.gargala@uoi.gr

Toki Eugenia
Professor,
Department of Speech and Language Therapy,
University of Ioannina,
University Campus B', 45500, Ioannina, Greece
e-mail: toki@uoi.gr

ABSTRACT

Pragmatic competence is a crucial component of social communication, especially during childhood. Children with Pragmatic Language Impairment (PLI) or other Neurodevelopmental Disorders (NDDs) often present with deficits that affect their social integration. Eye-tracking technology offers an innovative and objective assessment tool, enabling the recording and analysis of eye movements and attentional focus during communication tasks. This systematic review, conducted according to PRISMA 2020 guidelines, analyzes 43 relevant studies (2019–2025) from PubMed, aiming to evaluate the application of eye-tracking in the detection of early pragmatic indicators. The findings suggest that eye-tracking technology can identify subtle early differences in children's social-communicative abilities, thereby contributing to timely diagnosis. Reduced duration of social gaze and limited use of smiling during interaction are associated with increased symptoms in children with autism and difficulties in processing social cues. The use of eye-tracking enhances diagnostic validity, supports early intervention, and is proposed as a tool to be integrated within therapeutic and educational programs.
This technology offers new perspectives for improving the quality of life of children with neurodevelopmental disorders through targeted and evidence-based intervention.

ABSTRACT

The organizational and administrative reconstruction of the modern Greek school unit has as its main objective the smooth and efficient operation of the unit, in its internal context of operation, but also in the wider social fabric that exists and evolves. The use of Information and Communication Technologies (ICT) is a recurring reality and can offer, through practical and modern technological tools, more efficient and effective performance of human resources. Without affecting what type of organization it will be, i.e. whether it serves a school or a company, an efficient and reliable management information system, (MIS) is always a great investment for the organization. Its evaluation at regular intervals to judge the return on this investment is necessary.

An essential role of Educational Information Systems is to reduce, in the phase of planning individual measures of educational policy, the lack of certainty by providing information that can be used to make the right decisions in the right way. In other words, the benefits implied by the use of educational information systems are linked to the increase in the efficiency and effectiveness of the administration and educational staff of any school organization. Efficiency is related to the ability to make decisions correctly. Effectiveness refers to the ability to make the right decisions. Therefore, making the right decision does not mean making the right decision.

Educational Information Systems do not directly provide standardized decisions to users, nor do they suggest a pre-designed way of making decisions that ensures success. They serve the persons involved with educational issues in the decision making process by providing a range of selected information that are the outputs of processing appropriate data entered into the computer. Therefore, the person who will be considered to make some important decisions, from the field of education, will rely not only on the information provided by the information system, but also on his/her experience, judgment and intuition. Finally, one issue to be considered is the functionality of the existing information system and the need to rebuild or expand it.

The aim of this paper is to present the potential of information systems to provide a productive and efficient way to serve the needs of school structures. They are a useful tool in the hands of the administration, as they are able to know at any time the programming that has been carried out as well as all the important information related to it.

Keywords: Information technology, Digital reconstruction, Educational information systems.

THE CONTRIBUTION OF INFORMATION SYSTEMS IN EDUCATION: EVALUATING THE EFFECTIVENESS OF MYSCHOOL

Kotzamouratoglou Georgios
Secondary Education Teacher, Educator in Electrical Engineering and Economics
1st Vocational Training Center of Preveza, Secondary Education Directorate of Preveza
Preveza, Greece
email: kotzamou@sch.gr

ABSTRACT

The digital era and the integration of information systems in organizations have led to significant changes in the management of educational structures, with information systems playing a crucial role in educational administration. This paper evaluates the contribution of Myschool information system to Greek education, its effectiveness, advantages and disadvantages, as well as proposals for its improvement, based on a literature review.

Myschool is an integrated system that allows the centralized management of information regarding infrastructure, students, teachers, and school unit processes. Its implementation has significantly improved educational administration by reducing bureaucracy, increasing transparency, and facilitating decision-making. The key benefits of using Myschool include the effective management of student records, the reduction of workload, and instant access to attendance, grading, and monitoring data. Digitalization has accelerated data processing and storage, providing a comprehensive overview of the educational status of each school unit. Additionally, Myschool enhances communication between teachers, parents, and administrative staff, offering continuous updates on student progress.

Despite its advantages, there are issues regarding the need for further simplification, facilitation, and automation of tasks within Myschool platform. Many teachers and administrative staff struggle to use it effectively due to a lack of training. This highlights the need for interface and functionality improvements to make it more user-friendly. The lack of guidance and training results in reduced efficiency and limited use of the system's capabilities. Further automation in data entry and updating processes would help reduce the workload for educators and administrators. The ability to extract data in a specific format from other programs (e.g., Excel, timetable software) would facilitate the faster input of large data volumes (such as laboratory equipment) or the easier entry of school timetables generated by other software. Ideally, Myschool should also include a timetable generation feature. Additionally, functionalities such as recording meeting minutes or automatically identifying teacher shortages and surpluses would assist in better planning for the upcoming academic year.

Furthermore, integration with other government platforms could streamline tasks, reducing the need for multiple data entries and enabling instant data validation. The system appears to be less capable in data analysis compared to international systems. A comparison of Myschool with systems such as SIMS (UK) and PowerSchool (USA), along with the examination of existing studies, revealed that the Greek system lags in data analysis and adaptability to school needs.

To enhance Myschool, proposed improvements include the addition of data analysis tools, integration with other platforms, and the development of a more user-friendly environment. Continuous user training, strengthening security mechanisms, and enabling data retrieval from other applications, are also crucial for optimizing the system's usage. Additionally, differentiated access for teachers, students, and parents could further enhance Myschool's role.

In conclusion, Myschool has played a significant role in modernizing Greek education by providing new tools for managing and analyzing educational data. However, for it to offer even more benefits, continuous system development, user-oriented adaptation, ongoing training, and improved data security and accessibility are essential. The future development of Myschool can significantly contribute to improving the effectiveness and quality of educational administration in Greece and enhancing teaching processes.

Keywords: Information systems, educational administration, Myschool, Digital data management.

EVALUATION OF THE MYSCHOOL PLATFORM: TEACHERS' VIEWS, PROBLEMS AND IMPROVEMENT STRATEGIES

Gaki Vassiliki
Chemist, PE04.02 & Computer Scientist PE86

Preveza, Greece
email: iliasde66@gmail.com

ABSTRACT

This research focuses on the use of the MySchool platform by teachers and analyses their views on its functionality, its impact on school administration and the problems they face when using it. The aim is to investigate teachers' use of the platform, evaluate its functionality, and identify the problems and needs that arise during its use. It aims to understand how teachers perceive the contribution of the platform to the educational and administrative process of the school, to highlight differences in views between new and experienced teachers, as well as principals, and to suggest strategies for enhancing functionality and resolving the technical issues they face.

The research, which was carried out at a national level, is part of my thesis in the framework of the postgraduate program "Business and Organization Management" of the Department of Accounting and Finance of the University of Ioannina. The research is based on a sample of 143 teachers, of which 75 are women and 68 are men. The majority of the participants are aged 36-50 years old, hold a postgraduate degree, work in secondary schools and have not been trained in the Myschool information system and have no experience of using other information systems.

The results show that teachers' views on the MySchool platform are generally positive, with most of them finding it easy to use and the experience positive. However, variations in the evaluation of the platform are identified, mainly focusing on technical problems, such as difficulty in compatibility with other systems. Despite these difficulties, teachers acknowledge that MySchool contributes significantly to school data management and administrative tasks, although the survey shows that it has not significantly reduced their administrative burden.

Teachers express the need for new features on the platform, such as the possibility to request certificates online and receive real-time notifications, which would greatly facilitate their daily work.

The research concludes that there is a need for technical improvements to the platform and its integration with other digital applications and systems in order to enhance its overall functionality and better serve the needs of teachers and the school community. Suggestions for improving MySchool include developing new tools and optimising existing ones to enhance the efficiency and usability of the platform in the educational process.

Keywords: myschool, research, functionality, user perceptions.

DIGITAL TRANSFORMATION AND EDUCATION: THE CONTRIBUTION OF MANAGEMENT INFORMATION SYSTEMS MYSCHOOL

Gaki Vassiliki
Chemist, PE04.02 & Computer Scientist, PE86
Evening Vocational High School of Preveza
Preveza, Greece
e-mail: iliasde66@gmail.com

ABSTRACT

The paper focuses on the study and analysis of Management Information Systems in the field of education, with particular emphasis on the MySchool system in Greece. Its aim is to examine the role of these systems in the effective management and storage of school data and their contribution to the digital transformation of the educational system. The paper highlights the importance of Management Information Systems, such as Student Information System, Learning Management System, Decision Support System, etc., in enhancing administrative and academic processes, supporting strategic decision making and achieving greater transparency and efficiency in educational institutions.

The methodology used includes a review of the literature on Management Information Systems in education, the analysis of the Greek MySchool system, as well as the reference to international studies and examples from other countries. There, the challenges associated with the implementation of these systems, such as resistance to change, lack of qualified staff and technological limitations are evaluated.

The findings of the study show that Management Information Systems, such as MySchool, contribute significantly to the better management of student and school data, as well as to the facilitation of administrative processes. At the same time, the integration of scattered systems into a single platform enhances transparency and efficiency, allowing for continuous monitoring of learning performance, teacher evaluation and improved strategic decision-making. During the COVID-19 pandemic, MySchool helped support electronic communication, demonstrating the necessity of digital technology in education.

Overall, the paper highlights the importance of Management Information Systems in the educational process, recognizing their advantages in the development of educational systems and strategic decision making, while highlighting the challenges associated with their implementation. The success of these systems depends on their appropriate support, training and adaptation to the current needs of education.

Keywords: Digital transformation, Management Information Systems, MySchool, education.

QUALITATIVE EVALUATION OF OPSYD AS AN EGOV SYSTEM FOR EDUCATION MANAGEMENT

ABSTRACT

This qualitative study evaluates OPSYD (Integrated Information System for Primary and Secondary Education), an e-Government system integral to the management of personnel in Greek Primary and Secondary Education. OPSYD, classified as a human resources management information system, enables two-way interaction between educators and regional Education Directorates, allowing electronic application submissions, document uploads, and formal requests. The research, conducted between February and June 2024 through structured interviews in the regions of Epirus and Peloponnese, involved 15 non-permanent teaching staff and 7 administrative personnel from regional education directorates. The interviews aimed to document user interactions, identify difficulties, and gather suggestions for improving administrative processes.

Key findings reveal that the primary concerns are not technical issues with OPSYD itself, but rather challenges stemming from administrative procedures and their implementation, particularly the fragmentation across multiple information systems. This user group advocates for a single information system or automatic data transfer between systems and suggests allowing file updates at any time, not solely during open calls. Administrative personnel reported significant time waste due to repetitive data entry across different systems like MySchool, eDataCenter, and the Human Resource Register, none of which interoperate for automatic data synchronization.

The study concludes that designing and implementing interoperability solutions between existing information systems is imperative to enable mass data input and automated synchronization, thereby reducing processing times and allowing staff to focus on substantive tasks. It also proposes enhancing communication capabilities to facilitate timely error correction for applicants. Recommendations include decoupling document updates in OPSYD from call announcements, allowing continuous submission, and integrating AI-supported chatbots, supervised by human experts, to provide guidance to applicants. Furthermore, incorporating specialized knowledge for assigning educational specialties into the eDiplomas system would ensure automatic and accurate updating of educational specialties directly from universities.

Keywords: OPSYD, e-Government, Human Resources Management, Education Management, Administrative Procedures, Interoperability

REPORT ON THE FIRST SIX-MONTH EXPERIENCE FROM THE IMPLEMENTATION OF THE TEACHERS' ASSOCIATION DIGITAL BOOK OF ACTIONS IN SCHOOL UNITS: FROM THE CONSOLIDATED ADMINISTRATIVE RELATIONSHIPS OF TEACHERS TO THE CONSOLIDATION OF THE DIGITAL BUREAUCRACY

ABSTRACT

The law on the introduction of the "Digital Teachers' Association Register" (No. 3446/16-05-2024 – Government Gazette 2988/B/28-05-2024) on May 28, 2024, and its implementation in September 2024 in schools, marked significant qualitative and quantitative changes in school administration. For those schools that implemented and applied the law and incorporated it as a "digital management" tool within their administrative procedures, they encountered underlying contradictions and conflicts of time, contradictions during implementation, but also challenges from the benefits. The implementation of this law marked a transition from the established standardized practices of the Associations' procedures to a new regulatory reality, which introduced elements and characteristics of digital transformation into the school unit, recognized by all teachers. This article, which is part of the fruitful academic dialogue of the Conference on a dynamic relationship between digital media, administrative care, and educational work, is presented in the form of a "report" and reflects experiences, difficulties, and prospects from this new reality. The presentation, from the perspective of the administration and management control of schools, does not gloss over, especially those points of the application of the law on the "Digital Book of Teachers' Association Proceedings," which acted as an obstacle to the smooth implementation of administrative work, nor does it ignore the ominous prospect of establishing collegial relationships in subordinate and hierarchical relationships that reinforce digital bureaucracy, rather than facilitating the exercise of administrative work. Above all, however, it does not hide the fact that, ultimately, superficial information is not enough for the digital transformation of schools; rather, investment is needed in the digital literacy of all members of the school community, without exclusion or bias. However, this is not a matter of legislation, but of a comprehensive, authentic, transformative administrative policy for all schools.

ABSTRACT

The digital transformation of education has radically redefined the role of educational leaders, who are now required to navigate complex environments, develop new competencies, and shape strategies that meet the demands of 21st-century education. This paper explores the main challenges, emerging innovations, and transformative practices that are reshaping educational leadership in the modern digital age.

A key challenge is the digital divide, which creates inequalities in access to technological infrastructure and digital learning opportunities. Simultaneously, increasing concerns about data privacy require the implementation of strict policies and the appointment of data protection officers within schools. The need for ongoing professional development emerges as a critical factor for the effective integration of technology in teaching, while the adoption of emerging technologies such as artificial intelligence, cloud computing, and big data demands strategic planning and targeted training.

In response to these challenges, educational leaders adopt innovative approaches, such as data-driven decision-making, which enhances the effectiveness of educational interventions and policies. Adaptive and transformational leadership fosters flexibility, collaboration, and the creation of transparent, cooperative educational environments. At the same time, tools like online learning platforms and micro-credentials are being leveraged to strengthen teachers' digital literacy and support their professional advancement.

Particular emphasis is placed on transformative practices such as personalized learning, which uses technology to tailor educational content to students' needs and interests, thereby boosting engagement and achievement. Equally important is collaborative decision-making, which promotes the involvement of all stakeholders—teachers, students, and parents—in shaping school strategy, fostering a sense of trust and shared ownership. The paper highlights examples of innovative approaches implemented in schools and educational networks, underscoring the potential of modern leadership models.

In conclusion, educational leadership in the digital era requires a redefinition of strategies, strengthening of professionalism, and the adoption of a culture of continuous learning and adaptation. Educational leaders must lead with vision, blending expertise, collaboration, and technological integration to meet the demands of contemporary education. This paper provides a conceptual framework and a set of practical tools that contribute to the scientific and professional dialogue on education in the age of digital transformation.

EDUCATIONAL DIGITIZATION: CHALLENGES, OPPORTUNITIES, AND ITS IMPORTANCE FOR MODERNIZATION AND EQUALITY IN THE EDUCATIONAL PROCESS

Ntentes Ilias
Economist, PE80 & Electronics, PE84
1ºGeneral Higj School of Preveza
Preveza, Greece
email: iliasde66@gmail.com

ABSTRACT

This paper examines digitisation in education, focusing on understanding its basic concepts, its historical development, global trends, its importance and its application in public education, as reflected in the relevant literature. It aims to provide a comprehensive overview of the various dimensions of digitisation in education, as well as the challenges and opportunities arising from the use of technologies in educational processes. In addition, it aims to highlight the importance of digitisation for modernising education and enhancing students' skills, while examining its impact on equity and accessibility in education.

First, the paper examines the definition and scope of digitisation in education. Some of the main features of digitisation include the integration of digital tools and resources, such as e-platforms, digital textbooks and online learning platforms, which enable teaching and learning in a variety of environments and formats. Digitisation extends to many areas, such as the storage and distribution of materials, the interaction between students and teachers and the possibility of customised learning pathways for students.

The process of digitisation started with the introduction of computers in classrooms and gradually evolved with the use of online tools and platforms. Today, digitisation is promoting the development of new pedagogical models that combine interactivity and personalisation of learning, allowing students to interact with the teaching material and actively participate in the educational process. Through these tools, it is possible to better organise and monitor the educational process and to ensure the proper functioning of schools.

A key element of the work is the analysis of digitisation in education, which strengthens students' digital literacy skills, preparing them for the demands of the 21st century and the modern labour market. The development of skills such as critical thinking, creativity and problem-solving is becoming imperative to ensure the smooth integration of students into the information and technology society. In addition, digitisation offers the possibility of effective management of the educational environment, both at administrative and pedagogical level, making educational processes more efficient, flexible and adapted to modern needs.

This paper then focuses on enhancing equity in education by ensuring that educational resources are accessible to all students, regardless of socio-economic status or geographical location. The COVID-19 pandemic has accelerated this process, making digital solutions essential to ensure uninterrupted education in challenging circumstances. The increased reliance on digital technologies during the pandemic highlighted their fundamental importance for the adaptation and effectiveness of the education system in emergency situations. Today, digitalisation is recognised as a critical element for the modernisation and evolution of education, contributing to the transformation of the educational process in the era of digital transformation.

Keywords: Digitization, education, modernization.

THEORETICAL APPROACHES TO THE PERCEPTION OF INFORMATION SYSTEMS USERS EDUCATION MANAGEMENT

Ntentes Ilias
Economist, PE80 & Electronics, PE84
1st General High School of Preveza
Preveza, Greece
email: iliasde@hotmail.com

ABSTRACT

This paper aims to analyze the theoretical approaches related to the acceptance and adoption of new technologies in the field of education, with particular reference to Educational Management Information Systems (EMIS). Its main purpose is to investigate the parameters that influence the use of these systems by their users, such as teachers, school principals, and other educational stakeholders, as well as to analyze the theoretical concepts related to their usage, through the Technology Acceptance Model (TAM), the Unified Theory of Acceptance and Use of Technology (UTAUT), and Rogers' Diffusion of Innovations Theory.

The objective of the study is to understand the factors that affect the acceptance of Educational Management Information Systems by their users, and to explore the strategies required to enhance the effectiveness of these systems in the educational sector. The paper focuses on examining the implementation of EMIS in various educational environments, analyzing the challenges and difficulties users face, and the potential impacts these challenges may have on the adoption and effectiveness of such systems.

The methodology followed aims to investigate theoretical approaches and evaluate their application at a practical level. Additionally, the study seeks to identify the barriers users encounter during the implementation of EMIS and to analyze strategies that could strengthen their adoption. Central to the discussion is the need for effective user support and training, as well as the improvement of infrastructure necessary for their successful implementation.

The study focuses on analyzing parameters associated with the positive or negative impact of user perceptions regarding the usability and usefulness of Educational Management Information Systems. It also examines the importance of social influence and facilitating conditions in the acceptance of these technologies.

This research presents important findings and proposals for improving EMIS in order to enhance efficiency and equity in education through the use of new technologies.

THE ATTITUDES AND PERCEPTIONS OF PRIMARY AND SECONDARY EDUCATION EXECUTIVES IN THE GREEK EDUCATION SYSTEM, ON THE ADMINISTRATION OF EDUCATION AND THE INNOVATIONS THAT ARE IMPLEMENTED

Paschodimas Georgios
Secondary Education Teacher, PE11 Physical Education
Preveza, Greece
email: g.paschodimas@yahoo.gr

ABSTRACT

This research was carried out for the needs of writing the teacher's Thesis in the context of completing the Postgraduate Program entitled "Administration & Organization of Educational Units" at the International Hellenic University, which was completed in June 2024.

The study presents important findings regarding: the profile, perceptions of educational executives on educational administration, the needs and challenges they face, as well as the priorities for improving the educational system.

For the needs of publishing research data at the 1st International Scientific Conference of Preveza entitled: "Digital Media in Modern Educational Reality, Positions, Contrasts, Challenges and Prospects", results of the study that deal with the evaluation of the use of digital media as innovative practices in educational administration, with the aim of upgrading administrative procedures and improving communication within the educational organizationwere sought.

This study explored, among other things, how digital transition can contribute to reducing bureaucracy, saving time and resources, as well as enhancing transparency and collective decision-making. A quantitative methodology was used to carry out the research, collecting data through structured questionnaires distributed to teachers and administrators from various levels of the education system. The sample was selected purposively to ensure the representativeness of the population and to capture different perspectives on the use of digital media in daily administrative practice. The data analysis was carried out using statistical methods, allowing conclusions to be drawn about the effects and challenges that accompany the integration of digital technology.

Keywords: digital media, educational administration, innovation, digital transition, vocational training.

DIGITAL MEDIA AND MANAGEMENT OF EDUCATIONAL UNITS

Chalvantzis Vassilios, PE79.01
Director of Preveza Music School
Preveza, Greece
email: billchalv@gmail.com

ABSTRACT

The integration of digital media in educational management has significantly changed the way schools and academic institutions operate. With the rapid advancement of technology, digital tools have become essential for school principals, teachers, and administrators, enhancing communication, decision-making, and overall effectiveness. This paper explores the role of digital media in educational management, highlighting the benefits, challenges, and best practices for effective implementation.

Digital media includes a wide range of technological tools, such as social media platforms, learning management systems (LMS), cloud-based collaboration tools, and data analytics software. Platforms such as Google Workspace for Education and Microsoft 365 Education enable real-time collaboration, document management, and task organization, offering a comprehensive solution for school management.

One of the key advantages of digital media in school management is its ability to facilitate instant and transparent communication. Applications such as Zoom, Microsoft Teams and Google Meet support online meetings, ensuring seamless interaction between school staff, students and parents. In addition, social networking platforms such as Facebook, Twitter and LinkedIn help educational institutions communicate with their communities, share updates and promote their activities.

Learning management systems (LMS) such as Moodle, Google Classroom and Blackboard have revolutionized education management by simplifying course management, tracking and sharing resources. Teachers can organize lesson plans, distribute assignments and monitor student progress through these tools, making the process more transparent and efficient.

Data analytics plays a crucial role in modern educational management. Tools like Google Forms, Microsoft Forms, and Power BI allow administrators to collect and analyze data related to student performance, engagement, teacher effectiveness, and resource allocation. Using predictive analytics, school administrators can identify trends, proactively address challenges, and improve academic outcomes.

In addition, digital media supports participatory governance by encouraging collaboration between teachers, students, and stakeholders. Tools like Slack, Trello, and Asana offer platforms for effective project management, task coordination, and improved teamwork.

Despite their numerous advantages, the adoption of digital media in educational institution management presents several challenges. Data security and privacy are major concerns, which is why solutions like GDPR Compliance Tools (OneTrust, TrustArc) are required to manage personal data. In addition, the digital divide is a problem, as not all educational institutions have equal access to technological resources. Resistance to change among teachers and administrators can also hinder the successful implementation of digital tools. Providing adequate training and professional development programs is crucial to overcome these barriers. By investing in training programs and technological solutions, educational institutions can fully utilize digital tools, ensuring their effective and sustainable integration into school administration.

In conclusion, digital tools have revolutionized the management of educational institutions by improving communication, enhancing decision-making and streamlining administrative tasks. While challenges such as data security, the digital divide and resistance to change remain, adopting strategic policies and investing in professional development can ensure the successful integration of digital tools into education. As technology continues to evolve, educational institutions must embrace digital transformation to create more effective, inclusive, and adaptive learning environments.

Keywords: Digital media, educational unit management.

TA28: Teachers' professional development through the use of new technologies

SELF-TRAINING OF TEACHERS USING E-LEARNING-LAMAP IN THE FRENCH EDUCATION SYSTEM

Grivopoulos Konstantinos
Physics teacher,
Neochorion General high school
Messolonghi, Greece
e-mail: kgrivop@gmail.com

ABSTRACT

The e-learning platform Lamap was created to meet the training needs of French teachers in the field of science education. The platform's administrators and trainers offer kindergarten teachers, primary school teachers, and secondary school teachers a series of video tutorials for learning and consolidating the inquiry-based science education, but also address topics of broader interest, adapted to the school level that each user-educator is interested in. In particular, the page on digital self-training course "démarches d'investigation" helps prepare teachers for student-centered teaching of natural sciences using the investigative method, familiarizing them with its individual stages. Users of the platform have access to scientific and educational material. In addition, they interact with their colleagues to exchange experiences, opinions, ideas, etc., through forums organized by topic. In this way, teachers develop professional skills from a distance at a time of their choosing and at their own pace.

The text is structured as follows: the introduction is followed by a definition of the concepts of self-education, learning communities, and the inquiry-based science education. Next, the architecture of the e-learning lamap platform is presented, along with how it works in the self-training and interaction of teachers.

Keywords: self-education, inquiry-based science education, digital e-learning tool-Lamap.

THE GENDER DIMENSION IN THE UTILIZATION AND USE OF DIGITAL TECHNOLOGY (BY TEACHERS, MALE AND FEMALE) IN SECONDARY EDUCATION

Efstathiadou Anna
Teacher PE02 Philology
1st Ptolemaida High School
Kozani, Greece
email: annitaefkoz@gmail.com

ABSTRACT

Since the 1980s, a decade in which New Technologies gradually made their presence apparent in many areas of human activity - in work, in education, in science, in politics - until today, gender differences have been observed in the access, use and exploitation of Information Technologies. The qualitative improvement of educational systems, the equal provision of digital skills, the reshaping of the educational system through digital transformation is a goal of strategic importance for the European Union and, of course, for Greece.

Modern research shows that gender, as a social construct, continues to be a significant factor of inequality in the field of digital technology. This is because stereotypical perceptions regarding the relationship between gender and new technologies reflect the widespread view that digital skills are a male field of action rather than a subject of women's occupation and specialization. Teachers themselves, both men and women, consider their students to be more capable than their female students in using and exploiting the potential of digital technology. Female teachers have lower expectations and limited confidence in their ability to integrate and use digital technology in everyday teaching practice.

This paper attempts a bibliographic overview of gender differences regarding the degree of utilization and use of digital technology by secondary education teachers in the educational process during the last two decades, especially, with the complete "penetration" and prevalence of ICT in all areas of human activity and expression, especially after the pandemic period. The COVID-19 epidemic crisis had serious consequences for education and training and created new data in the educational reality.

Specifically, gender differences are examined in terms of the attitudes and perceptions of female teachers towards the ever-increasing use of technology in education, the understanding of the urgent need to acquire digital skills for more effective adaptation to modern educational data, the digital skills possessed by female teachers compared to their male colleagues, their knowledge of digital tools (software, platforms, applications), and the degree of utilization of a wide range of digital technologies in the learning process and any changes that have occurred over the decades.

Keywords: gender differences, digital technology, teachers in secondary education, digital skills, digital literacy

THE PROFESSIONAL AND SCIENTIFIC DEVELOPMENT OF TEACHERS AS A CRITICAL DIMENSION AND PROSPECT OF ARTIFICIAL INTELLIGENCE CAPABILITIES

Mastrogiannis Alexios

Katsiopi Paraskevi
Primary School Principal
Primary Education of Aitoloakarnania
Agrinio, Greece
e-mail: voulakats@gmail.com

ABSTRACT

The training of teachers constitutes a key factor for the substantial upgrading of the quality of education. A well-trained teacher can significantly improve their pedagogical and teaching skills, enhance their scientific self-awareness, professional confidence, and enthusiasm, thereby creating the conditions that will enable them to respond more fully and successfully to the diversity and heterogeneity of their students' needs. The continuous scientific and professional development of teachers is considered essential not only for novice but also for experienced educators, since, apart from everything else, it strengthens both their passion and the effectiveness of their multifaceted and complex role. Although difficulties have been observed in changing teachers' teaching practices and beliefs, the value of targeted training programs is widely acknowledged—provided, of course, that these bridge the gap between theory and practice, as the great John Dewey had already emphasized back in 1914.

In today's digital era, teacher training is more necessary than ever. Beyond enhancing and optimally transforming the processes, dimensions, and parameters of teaching and learning, it can also highlight and provide new pedagogical skills to practicing educators—skills essential for creating interactive and constructive learning environments that respond to contemporary socio-economic and technological conditions. Towards meeting this challenging modern educational demand, the use of Artificial Intelligence (AI) in teacher training emerges as an indispensable digital mediation, as it can offer innovative and radical opportunities for supporting their professional and scientific development. AI can provide teachers with rich opportunities for microlearning and lifelong learning, analyze large volumes of educational data, suggest targeted pedagogical and instructional interventions, create personalized and differentiated teaching plans as well as realistic scenarios, and provide continuous and objective feedback. From now on, AI will play a significant role and share in building an effective training model, capable of supporting teachers in their demanding and multifaceted role, thereby ultimately enhancing the overall quality of educational work and consolidating the positive impact of the students' learning experience.

In this direction, the present study will present practical applications of AI, which can support the professional and scientific development of teachers and contribute significantly to the reform of the educational process, as well as to the constantly sought improvement of the quality of education.

Keywords: Artificial Intelligence, training, development, teacher

DIGITAL PROFESSIONAL DEVELOPMENT & EDUCATION: THE TEACHER IN THE TECHNOLOGICAL AGE

Poulios Christos
Education Counselor (PE81), M.Ed., MSc
Directorate of Secondary Education (DDE) of Ioannina

ABSTRACT

The professional development of teachers is an integral component of quality education, while rapid technological advancements create new opportunities and challenges. This study examines the contribution of digital professional development to enhancing teachers' instructional practice through the use of innovative tools such as distance learning, online training platforms, communities of practice, and artificial intelligence. The analysis is based on a literature review and presentation of selected case studies from the European and Cypriot educational contexts.

Keywords: digital professional development, teachers, distance learning, artificial intelligence, professional growth.

PERCEPTIONS AND ATTITUDES OF PRESERVICE SPEECH THERAPISTS TOWARD EYE-TRACKING TECHNOLOGY IN THE DIAGNOSIS AND SUPPORT OF READING SKILLS

Peklári Vasiliki
Philologist in Special Education, MSc,
PhD Candidate,
Department of Speech and Language Therapy
University of Ioannina,
Ioannina, Greece
e-mail: vpeklari@uoi.gr

Toki Eugenia
Professor,
Department of Speech and Language Therapy
University of Ioannina,
Ioannina, Greece
e-mail: toki@uoi.gr

ABSTRACT

This study explores the use of eye-tracking technology for the diagnosis and intervention of reading difficulties, focusing on the perceptions of undergraduate students in the Department of Speech and Language Therapy at the University of Ioannina. The aim of the study is to record the extent to which students perceive the benefits of this technology, their attitudes towards its integration in clinical speech and language therapy practice, and the challenges they may encounter during its application. The sample consists of 49 undergraduate students (M:5, F:44) who voluntarily participated by completing an anonymous questionnaire. The results indicate that students recognize the significant contribution of eye-tracking technology in enhancing diagnostic accuracy and developing individualized therapeutic interventions. However, several challenges are identified, such as the high cost of equipment, the need for specialized training, and the difficulty of incorporating the technology into established intervention practices. Preservice speech therapists recommended future research to further investigate the integration of eye-tracking technology in the education of speech therapists and related professionals, aiming to strengthen the clinical skills of future practitioners and to support the effective use of this technology for the early detection and intervention of difficulties affecting reading skills.

Pyrgos Ilias, Greece
e-mail: panagiotisandrouts@gmail.com

ABSTRACT

This research paper examines the application of Augmented Reality (AR) and Virtual Reality (VR) in the teaching of English language through physical activity in upper secondary and lower secondary schools in western Greece.

The impact of digital technologies on improving language skills and enhancing motor engagement was evaluated using a sample of 65 students and 15 teachers. Based on the principles of active learning, the project included interactive scenarios in which students practised language skills through physical and collaborative activities.

The results showed significant improvements in participation, language proficiency (vocabulary, pronunciation) and memory through movement. Additionally, enhanced social interaction and cooperation were observed. Notwithstanding the favourable outcomes, certain challenges were identified, including the substantial cost of the necessary equipment and the necessity for teacher training in the use of these technologies.

Therefore, combining AR and VR with physical activity emerges as an innovative educational practice with potential application in wider educational settings.

Keywords: Digital media, AR, VR, English language, physical activity.

INTRODUCTION

The rapid development of Information and Communication Technologies (ICT) has had a significant impact on the emergence of new fields of application for innovative teaching approaches, which enhance the learning experience in an experiential and interactive way. The integration of Augmented Reality (AR) and Virtual Reality (VR) within the educational process is a particularly dynamic area of development, as these technologies facilitate the simulation of realistic situations and the immersion of students in environments characterised by increased interaction and cognitive engagement (Radianti et al., 2020). In the field of language education, particularly English language instruction, AR and VR technologies have the potential to facilitate the creation of multimodal environments that allow students to engage in authentic, realistic linguistic interactions. Research has demonstrated that such environments promote active participation, enhance motivation, and foster both communicative skills and linguistic autonomy in students (Chen, 2016; Godwin-Jones, 2018).

Concurrently, the correlation between language learning and physical activity aligns with the tenets of experiential and embodied learning, according to which physical movement serves as an enhancer of cognitive processing and memory (Shapiro & Stolz, 2019). The integration of movement-focused activities within the context of language education, particularly in conjunction with AR and VR technologies, fosters a multidisciplinary approach to learning, thereby enhancing both the linguistic and motor skills of students (Ferrer-Torregrosa et al., 2015).

This paper focuses on exploring the contribution of Augmented and Virtual Reality technologies to English language learning through physical activity, analysing the theoretical framework, pedagogical benefits and practical applications of this approach. The primary objective of the present study is to examine the role of AR and VR technologies in educational practice, with an emphasis on their interdisciplinary use in the field of language and physical education. The integration of these elements appears to be associated with increased active student participation, the development of problem-solving skills, and the enhancement of learning through experiential training (Radianti et al., 2020; Bacca et al., 2014).

The present research aims to evaluate the effectiveness of virtual and augmented reality technologies in improving language communication and developing motor skills. Previous studies have shown that such learning environments enhance multisensory engagement, leading to a better understanding of concepts and vocabulary (Chen, 2016; Parmaxi, 2020). The study also examines the attitudes and perceptions of students and teachers towards the use of these technologies in educational practice, with particular reference to Dunleavy and Dede's (2014) finding that acceptance of such tools is directly related to their integration into teaching and pedagogical use. Furthermore, the study seeks to identify the key challenges and conditions necessary for successfully implementing VR and AR technologies in teaching practice (Shin, 2021). Obstacles such as equipment, technical support, and teacher training are critical factors affecting the efficacy of such interventions (Liu et al., 2017).

THEORETICAL FRAMEWORK

The integration of VR and AR technologies in the educational process has emerged as an innovative approach to enhance learning, especially in fields that require experiential engagement and active participation, such as language education and physical education (Radianti et al., 2020). VR and AR technologies offer rich multisensory experiences, enabling students to interact with 3D environments and actively participate in experiential learning scenarios (Dede, 2009). As posited by Dunleavy and Dede (2014), augmented reality functions as a cognitive enhancer, furnishing information at the point of action and thereby reinforcing the connection between theory and practice. Conversely, virtual reality facilitates complete immersion in a digital environment, rendering it conducive to situational simulation, kinesthetic practice and experiential learning (Slater & Wilbur, 1997). Conversely, AR integrates digital components into the physical environment, thereby facilitating a more robust connection between theoretical concepts and practical applications (Billinghurst et al., 2015).

In the field of language education, the integration of VR and AR technologies fosters the development of authentic communicative environments which provide students with the opportunity to hone their language skills in virtual scenarios that emulate real-life contexts, thereby enhancing interactive communication and fostering cultural empathy (Lin & Lan, 2015). As asserted by Godwin-Jones (2016) and Chen (2016), such technologies have been shown to facilitate participatory learning and vocabulary development, while concomitantly enhancing students' motivation and engagement in the learning process.

In a similar manner, in physical education, the use of VR and AR technologies facilitates the simulation of sporting activities and the comprehension of kinesiological concepts through visualisations and interactions (Gao et al.,

2020). These digital applications allow students to engage in practice in controlled environments, thereby providing safety and the ability to monitor performance with real-time feedback (Flynn et al., 2018). Furthermore, research has demonstrated that the integration of such technologies has been shown to enhance motor learning, motivational engagement and improve students' physical self-concept (Barkley et al., 2019).

Acceptance on behalf of the teachers as well as their attitudes towards these technologies play a pivotal role in the success of their integration in the classroom. The Unified Theory of Acceptance and Use of Technology (UTAUT) model developed by Venkatesh et al. (2003) underscores the significance of factors such as expected performance, the effort of use, social influence, and facilitating conditions in influencing teachers' intention to adopt new technologies. Concurrently, as asserted by Rogers (2003), the adoption of innovation is favoured when technology is perceived to be compatible with the needs, values and culture of the users. Consequently, the training of teachers and the enhancement of their technological competence have become necessary conditions for the successful integration of VR and AR technologies into educational practice (FitzGerald et al., 2013).

However, the implementation of these technologies is not without its challenges. Issues related to high equipment costs, lack of technical support and the need to customise the curriculum constitute major constraining factors (Radianti et al., 2020). Teachers have expressed reservations regarding the efficacy of these technologies, and some have encountered challenges in designing suitable teaching scenarios with VR/AR, particularly in school settings with restricted access to digital resources (Dunleavy, 2014).

METHODOLOGY

Statistical analysis

The initial data analysis was performed using Microsoft Excel software for the purpose of organisation and preliminary processing. The statistical analysis was conducted using SPSS software (version 25). As part of the descriptive analysis, qualitative variables were recorded using absolute and relevant frequencies, while quantitative variables were described using mean values and standard deviations.

RESULTS

Demographic characteristics

Table 1.
Demographics of the participating teachers (N=15)

Questions	N	Percentage / M ± SD
Sex		
Male	8	53.3%
Female	7	46.7%
Age	15	40.53 ± 7.873
Years of teaching experience	15	14.53 ± 7.782

The present research study is comprised of a sample of 15 teachers and 65 students from lower secondary (gymnasio) and upper secondary (lykeio) schools within the jurisdiction of the Regional Directorate of Primary and Secondary Education of Western Greece (PDEDE). The demographic characteristics of the teaching staff are presented in detail in Table 1. Of the total number of participating teachers, 8 were male (53.3%) and 7 were female (46.7%). The mean age of the teachers was calculated to be 40.53 years (Standard Deviation = 7.873), while the mean years of teaching experience was 14.53 years (Standard Deviation = 7.782).

In addition, the demographic characteristics of the students are presented in Table 2. Of the total 65 students, 34 were female (52.3%) and 31 were male (47.7%). The majority of them attend lower secondary school (53.8%), while 46.2% attend upper secondary school. The mean age of the participating students was 15.34 years (SD = 0.94).

Table 2.
Demographics of the participating students (N=65)

Questions	N	Percentage / M ± SD
Sex		
Male	31	47.7%
Female	34	52.3%
Grade level		
Lower secondary school	35	53.8%
Upper secondary school	30	46.2%
Age	65	15.34 ± 0.94

Table 3 presents data on the training and experience of teachers in relation to the use of AR and VR technologies. Of the total 15 participants, 5 (33.3%) have attended seminars or workshops related to the use of these technologies in education. With respect to the level of experience, the majority of teachers (53.3%) reported having "a little" experience, while 26.7% reported "moderate" and 20.0% reported "a lot" of experience.

Table 3.
Teachers' experience in using AR/VR technologies

Questions	N	%
Have you attended any seminars or workshops on using AR/VR technologies?		
Yes	5	33.3%
No	10	66.7%
Do you have experience in using AR and VR technologies?		
A little	8	53.3%
Moderate	4	26.7%
A lot	3	20.0%

Evaluation of AR/VR technologies

In order to ascertain the impact of the AR/VR programme on teaching practice, teachers were invited to respond to a series of questions. Responses were recorded using a four-point Likert-type scale (1 = Not at all, 2 = Not really, 3 = Yes, to some extent, 4 = Yes, to a great extent), with higher values indicating greater positive impact. The mean values and standard deviations are presented in Table 4 and Graph 1. Teachers' opinions indicated that the most significant impact was found in the activation and participation of students, which was rated at a high level (M = 3.47). The impact of the programme on enhancing cooperation and communication among students was also rated at a satisfactory level (M = 3.00). Conversely, the enhancement in pronunciation (M = 2.80) and vocabulary (M = 2.67) is evaluated as favourable, albeit to a lesser extent.

It is noteworthy that the majority of teachers (86.7%) consider that the simulations employed during the programme reflect authentic communication situations. In relation to the extent to which AR/VR technologies contribute to the enhancement of the teaching process, 46.7% of respondents indicated that these technologies enhance it 'a lot', 40.0% considered the enhancement to be moderate, and 13.3% consider that these technologies enhance teaching 'very much'.

Table 4.
Mean values and standard deviations of teachers' views on the impact of AR/VR technologies on teaching and students

Questions	Mean Values	Standard Deviation
Did you notice an improvement in collaboration and communication among students during the use of AR/VR activities?	3.00	0.378
Did you notice an improvement in student engagement and participation in the lesson during the use of AR/VR activities?	3.47	0.640
Did you notice an improvement in students' vocabulary skills during the use of AR/VR activities?	2.67	0.617
Did you notice an improvement in students' pronunciation during the use of AR/VR activities?	2.80	0.775

Graph 1.
Mean values and standard deviations of teachers' views on the impact of AR/VR technologies on teaching and students

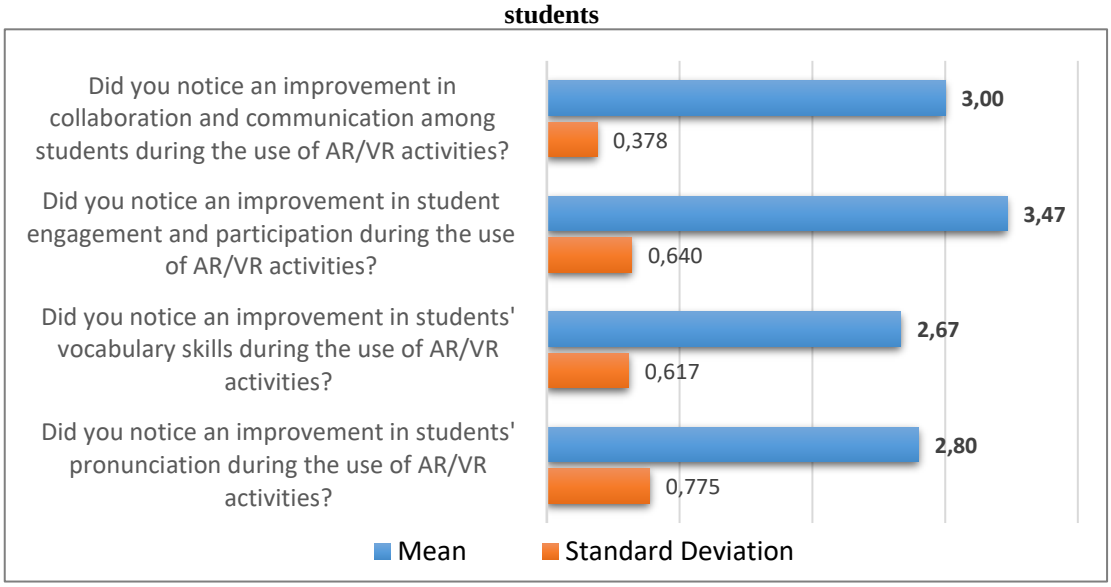

Table 5.
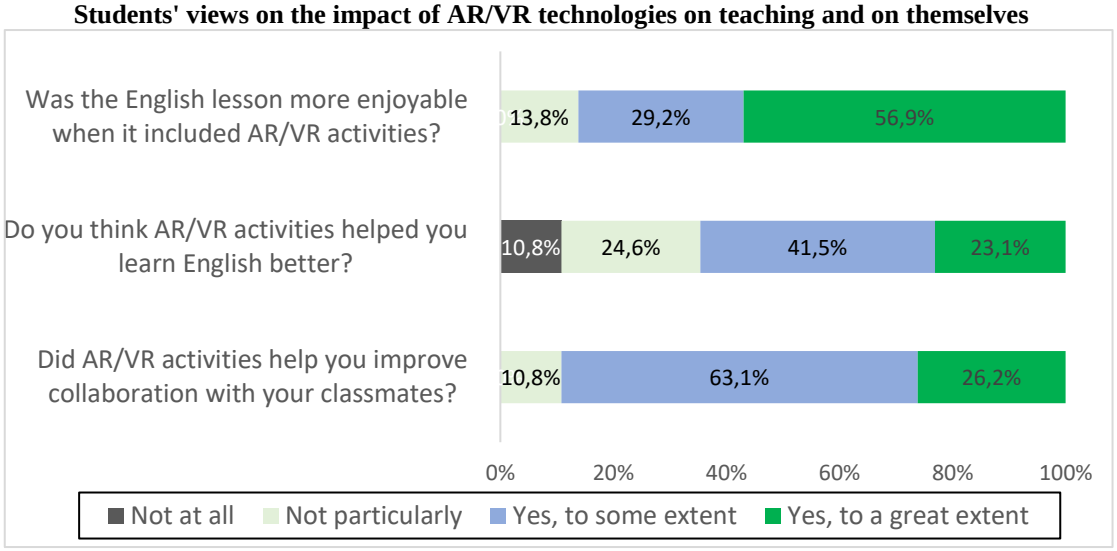
Teachers' views on enhancing teaching with AR/VR technologies

Questions	N	%
Do you think that the simulations used reflect real communication situations?		
Yes	13	86.7%
No	2	13.3%
Do you think that AR/VR technologies enhance teaching?		
Moderately	6	40.0%
A lot	7	46.7%
Very much	2	13.3%



Concurrently, the data presented in Table 6 indicates that the majority of students found the English lesson more enjoyable when it incorporated activities using AR/VR technologies. The majority of participants provided a positive evaluation of the experience, with many reporting that it was highly enjoyable. Furthermore, a considerable proportion of students indicated that these activities contributed to enhanced English language learning, although agreement with this statement was not equally unanimous. In conclusion, the majority of students conceded that the use of AR and VR technologies contributed to some extent to improving collaboration with their peers.

Table 6.
Students' views on the impact of AR/VR technologies on teaching and on themselves

Questions	Not at all	Not particularly	Yes, to some extent	Yes, to a great extent
Was the English lesson more enjoyable when it included the AR/VR activities?	-	13.8%	29.2%	56.9%
Do you think AR/VR activities helped you learn English better?	10.8%	24.6%	41.5%	23.1%
Did AR/VR activities help you improve your cooperation with your classmates?	-	10.8%	63.1%	26.2%

As demonstrated in Table 7, the majority of students evaluated the activities employing AR/VR technologies as more interactive and enjoyable in comparison to conventional English teaching methods. Specifically, 40.0% of students rated them as "much more" interactive, while 30.8% rated them as "more" interactive. 27.7% of respondents found no substantial difference, while only one student reported finding them "less" interactive and fun. Furthermore, a significant proportion of participants (87.7%) indicated their preference for teaching with AR/VR technologies, should they have the option.

Graph 2.
Students' views on the impact of AR/VR technologies on teaching and on themselves

In conclusion, the vast majority of teaching staff (93.3%) reported encountering challenges during the programme's implementation. These challenges were predominantly related to the cost of required equipment or the lack of adequate technical support. A comparatively smaller proportion of 6.7% of respondents indicated that they did not face such difficulties. With regard to the need for further training in the effective use of AR/VR technologies within the classroom setting, a divergence of opinion amongst teachers is evident: 66.7% of respondents expressed the view that training is not necessary, while the remaining 33.3% considered it to be important for the optimal use of these tools in the educational environment.

Table 5.
Students' preferences towards teaching with AR/VR technologies

Questions	N	%
How interactive and fun did you find AR/VR activities compared to traditional teaching methods?		
Less	1	1.5%
Almost the same	18	27.7%
More	20	30.8%
Much more	26	40.0%
If you could choose between traditional teaching and teaching with the additional use of AR/VR technologies, which would you prefer?		
Traditional teaching?	4	6.2%
Teaching with AR/VR?	58	87.7%
I am not sure	3	4.6%

Graph 3.
Students' preferences towards teaching with AR/VR technologies

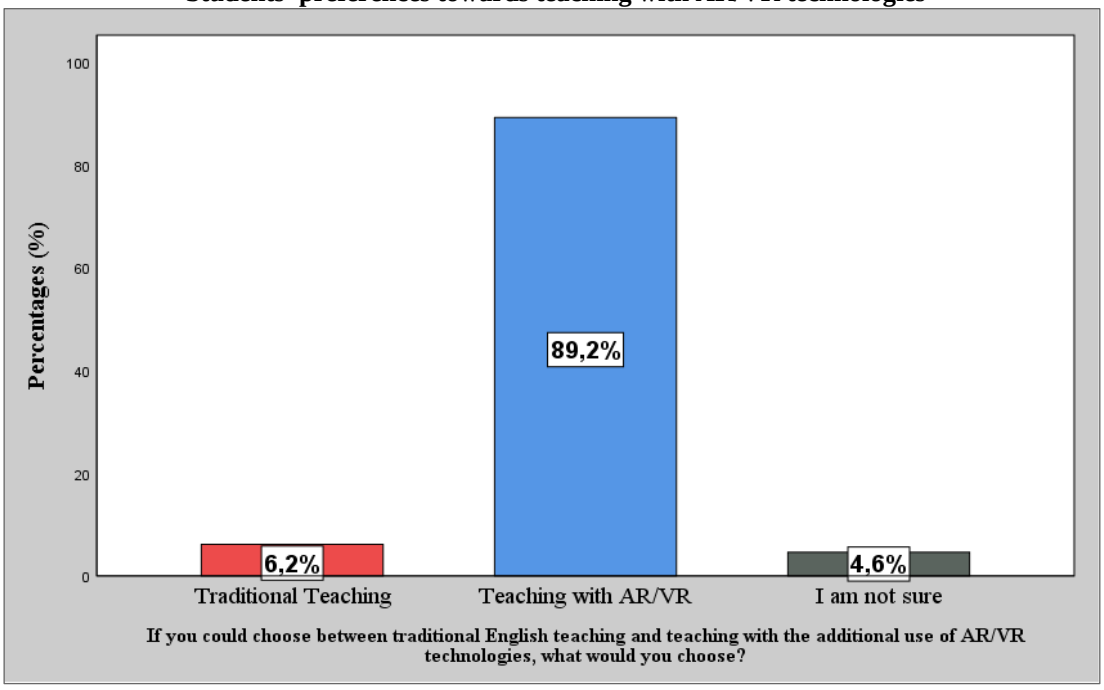


Table 8.
Difficulties encountered when using technologies and need for additional training

Questions	N	%
Did you experience any difficulties in terms of equipment costs or technical support?		
Yes	14	93.3%
No	1	6.7%
Do you think it is important for teachers to receive additional training on how to use AR/VR technologies effectively in the classroom?		
Yes	5	33.3%
No	10	66.7%

MAIN FINDINGS – CONCLUSIONS

The integration of VR/AR technologies has been demonstrated to enhance the learning experience, thereby improving participation, interest, language and social skills among students. In particular, a substantial improvement was observed in English comprehension and use, with a particular focus on oral communication, a finding that is corroborated by previous studies (Lin & Lan, 2015; Chiu et al., 2022). At the same time, the cultural simulations facilitated by VR have been demonstrated to foster intercultural empathy, thereby enhancing acceptance and respect for diverse cultural expressions as posited by Schott & Marshall (2018).

The findings of this study indicated that VR activities of a physical-motor nature had a particularly positive effect on students' cooperation and social interaction, which is in line with the results of Bonner & Reinders (2020). Participants expressed heightened interest and motivation during the lesson, identifying the approach with VR/AR technologies as more engaging than conventional teaching, consistent with the findings of Merchant et al. (2014).

However, the implementation of these technologies is not without its challenges. It has been documented that there are difficulties in adapting some students to the demands of the new technological environments. Furthermore, there are shortcomings in the equipment of some schools, and there are varying levels of technological competence among teachers. The efficacy of implementation appeared to be contingent on the provision of adequate teacher training, thereby corroborating the conclusions of Fowler (2015) and Makransky & Lilleholt (2018).

The findings of the research demonstrate that the use of VR and AR in the educational process serves to enhance the interdisciplinary and experiential nature of learning, thereby linkikg language, culture and physical activity within an integrated learning environment. The efficacy of language teaching is enhanced by its foundation in realistic, experiential communication scenarios, while physical education activities that employ simulations foster teamwork, social interaction and student motivation. The comprehensive use of these technologies necessitates the provision of suitable technological equipment, comprehensive and sustained pedagogical training for educators and institutional endorsement from educational policy.

RECOMMENDATIONS

The integration of virtual and augmented reality technologies within educational curricula necessitates meticulous strategic interventions both at the level of educational policy and teaching practice. Firstly, it is imperative to establish systematic training programmes for teachers, which should focus not only on the technical aspects of equipment management but also on pedagogical approaches that maximise the learning value of VR and AR technologies. The training programme should be designed to develop skills in designing experiential and multimodal learning scenarios.

Concurrently, substantial support of school units with the requisite technological equipment, such as virtual reality headsets, devices compatible with augmented reality applications, and specialised software, is imperative to ensure equitable access to digital learning experiences for all students. Infrastructure is a prerequisite for the successful implementation of these technologies on a large scale.

Moreover, the incorporation of VR/AR technologies into interdisciplinary teaching programmes, integrating language, physical education and intercultural education, has the potential to facilitate the holistic development of students. The cultural simulations provided by VR environments have been demonstrated to engender empathy, respect for diversity and acceptance of cultural difference, thereby enhancing intercultural awareness.

The development of social skills through group VR activities in the context of physical education or cooperative learning is of particular importance. These activities have been demonstrated to enhance social cohesion, interaction and collective problem solving.

In order to evaluate the effectiveness of interventions, it is necessary to create systematic evaluation tools that capture the progress, challenges and effects of VR/AR technologies on the learning process. It is finally proposed that pilot projects be implemented at varying levels of education, encompassing both primary and secondary education. The objective of this initiative is twofold: firstly, to conduct a comprehensive study of the varied needs of students according to their age group; and secondly, to formulate educational policies that are both evidence-based and targeted.

TEACHING QUANTUM THEORY IN SECONDARY EDUCATION: THE DOUBLE-SLIT EXPERIMENT AND THE DEVELOPMENT OF AN ICT-BASED EDUCATIONAL SCENARIO FOR 9TH GRADE STUDENTS

Maria Magaliou
Physics Teacher - PHD candidate, Department of Pedagogy and Primary Education,
National and Kapodistrian University of Athens
email: mvpmag@gmail.com

ABSTRACT

Quantum physics, despite its perceived complexity, forms the foundation of numerous modern technologies shaping our daily lives. From the computers we use to medical diagnostic imaging, quantum theory is integral to contemporary living. However, in Greece, its teaching in Secondary Education is primarily limited to students preparing for university entrance exams, thus excluding a significant portion of the student population from engaging with these fascinating concepts. Quantum theory raises profound questions about the nature of reality, knowledge, and the role of the observer. The double-slit experiment, an iconic phenomenon illustrating fundamental quantum concepts and philosophical implications, is notably absent from the Greek secondary school curriculum. Yet, teaching it can be a powerful tool not only for fostering scientific understanding but also for developing critical thinking.

This paper proposes a teaching scenario for 9th-grade students (third year of Gymnasium, in the Greek system) that leverages Information and Communication Technologies (ICT), specifically educational videos and PhET Colorado simulations ("Wave Interference," "Quantum Wave Interference"), to introduce the double-slit experiment. The scenario aims to promote active student participation, develop critical thinking skills, and connect scientific knowledge with broader philosophical and societal questions.

The core research question explored is: How can a teaching scenario utilizing ICT enhance the instruction of the double-slit experiment in Secondary Education, and how do students perceive and accept the teaching of quantum topics through these tools? Specifically, the research focuses on evaluating the effectiveness of ICT in teaching quantum concepts like wave-particle duality and how these technologies assist students in achieving a more accessible and meaningful understanding of the Double-Slit Experiment.

Preliminary findings from the pilot implementation of the scenario with 9th-grade students indicate that introducing basic quantum concepts at this age is feasible. The integration of ICT appeared to significantly increase student interest, enhance participation, and contribute to the development of a deeper understanding of quantum phenomena, particularly wave-particle duality as manifested in the double-slit experiment. While these initial results are encouraging, further large-scale research is required to fully assess the effectiveness of ICT and investigate the factors influencing student acceptance and comprehension of these abstract scientific domains.

Keywords: Quantum physics, Teaching scenario, Double-slit experiment, Information and Communication Technologies (ICT), Critical thinking

INTRODUCTION

The emergence of quantum physics in the early 20th century marked a profound paradigm shift in the understanding of the nature of reality. Fundamental concepts such as energy quantization, wave-particle duality, inherent uncertainty, superposition, and entanglement were introduced, revealing a universe governed by rules radically different from those of deterministic classical physics. In the classical world, knowing the initial conditions allowed for precise prediction of future states. In contrast, quantum mechanics describes the world in terms of probabilities, where uncertainty is an integral characteristic at a fundamental level. These revolutionary ideas not only reshaped science in depth but also profoundly influenced technology and philosophy, transforming how we perceive the world and knowledge (Müller & Wiesner 2002· Müller & Mishina, 2021). Despite its abstract nature and apparent distance from immediate daily experience, quantum physics now forms the bedrock for numerous modern technologies that shape our daily lives. From the development of lasers and semiconductors, medical imaging (e.g., MRI), to cryptography and the cutting edge of computational science with quantum computers, the principles of quantum mechanics play a central and increasingly vital role (Krijtenburg-Lewerissa et al., 2018· Staderman et al., 2021).

Recognizing the pivotal importance of quantum theory for understanding the modern world and future developments, many countries globally have integrated it into the science curricula of secondary education. Examples include Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Italy, Netherlands, Norway, Portugal, Spain, Sweden, and the United Kingdom (England and Scotland) (Stadermann et al., 2021). In contrast to this global trend, in Greece, the teaching of quantum physics at the Lyceum level remains extremely limited. It primarily reaches students intensively preparing for university entrance exams, and even then, only those aiming for science faculties. This situation creates significant educational exclusion, leaving a broad segment of the student population without meaningful exposure to the fundamental and revolutionary ideas of quantum mechanics.

The double-slit experiment is undoubtedly one of the most iconic and illuminating experiments in the history of physics, uniquely demonstrating wave-particle duality and the concepts of superposition and interference. Nevertheless, it is not systematically taught in Secondary Education in Greece. Its instruction, however, if approached appropriately, can become a powerful educational tool. It is not limited to merely presenting a physical phenomenon but offers the potential for cognitive understanding of the foundations of quantum physics, as well as for developing critical thinking skills, fostering familiarity with the Nature of Science (NOS), and exploring the philosophical implications of quantum theory.

Within the framework of addressing the above challenge and the necessity of introducing quantum concepts in Secondary Education, this paper proposes and presents a teaching scenario. This scenario leverages Information and Communication Technologies (ICT), specifically the use of educational videos and the interactive simulations "Wave Interference - Interference, Double Slit, Diffraction" and "Quantum Wave Interference" from the PhET Colorado platform. The aim is to teach the double-slit experiment to 9th-grade students. The scenario's approach does not stop at simply presenting scientific information but aims at promoting active student participation, developing their critical thinking skills, and connecting scientific knowledge with broader philosophical and societal questions that emerge from quantum theory. Our goal is to make quantum physics more accessible and understandable for this age group.

RESEARCH QUESTION AND METHODOLOGY

The core research question investigated through the implementation of the scenario is: 'How can the application of an educational scenario utilizing ICT enhance the teaching of the double-slit experiment in secondary education, and how do students perceive and accept the teaching of quantum topics through these tools?'. More specifically, we are interested in exploring how the scenario affects the effectiveness of the teaching, the understanding of quantum concepts, such as wave-particle duality, and students' acceptance of using ICT for approaching these abstract topics. To answer this question, we designed a methodological approach that includes the pilot implementation of the teaching scenario in 9th-grade classes. Subsequently, we proceeded to collect data through various tools, such as questionnaires administered to students, analysis of their worksheets, and observation of classroom teaching.

THE DOUBLE-SLIT EXPERIMENT: A HISTORICAL JOURNEY FROM CLASSICAL TO QUANTUM UNDERSTANDING

The double-slit experiment holds a distinguished position in the history of physics, recognized as one of the most pivotal, famous, and fundamental experiments ever conducted (Crease, 2002). Its significance is immeasurable, as it contributed decisively to the understanding of the dual nature of light and matter and acted as a catalyst for the radical revision of classical notions regarding the behavior of microscopic particles.

The initial version of the experiment was performed by Thomas Young in 1801, with the primary goal of providing experimental confirmation for the wave theory of light, which was at that time disputed by Newton's prevailing corpuscular theory. In its classical setup, a source of monochromatic light is directed towards a screen with two narrow, parallel slits. The light passing through these slits, acting as two coherent wave sources, creates a characteristic interference pattern on an observation screen behind the diaphragm. This pattern consists of alternating bright and dark bands (fringes), which are the direct result of the constructive and destructive interaction (interference) of light waves, thus confirming its wave nature (Cantor 1970). Interestingly, in its earliest form, Young did not use exactly two slits but a different approach. He covered a window with opaque paper having a small hole for a fine beam of sunlight to pass through, and then placed a thin object (card) within this beam. The bands of color on the sides of the shadow and the parallel lines within the shadow that he observed arose from the diffraction of light passing near the two edges of the object and their subsequent interference. The observation that the disappearance of these bands when one edge of the shadow was obstructed proved that they resulted from the interaction (interference) of light from the two sides. The appearance of the lines regardless of the intensity of light, even at low intensities, further reinforced the interpretation that they were the result of the interference of two portions of the wave aspect of light (Young, 1804).

The year 1927 was a landmark year for the establishment of quantum mechanics, as two independent experimental findings – by Davisson and Germer (Davisson & Germer 1927) in the USA, and by George Paget Thomson and Alexander Reid (Thomson & Reid 1927) in Scotland – provided undeniable evidence for the wave nature of electrons. These discoveries, resulting from experiments on electron diffraction by crystalline lattices, overturned the classical view of electrons as simple, localized particles. The observed diffraction patterns were similar to those seen in the diffraction of light, indicating that electrons behave like waves and confirming the correctness of the wave-particle duality theory proposed by Louis de Broglie (NobelPrize.org). De Broglie was awarded the Nobel Prize in Physics in 1929 for his discovery, officially recognizing the wave nature of electrons as a fundamental principle of physics.

The direct extension of the double-slit experiment to quantum particles, such as electrons, was first achieved by Claus Jönsson in the 1960s, while later Pier Giorgio Merli (1974) repeated it by emitting "one electron at a time." Jönsson's experiment was recognized as "the most beautiful experiment" in a Physics World poll in 2002. In this quantum version, a source emits particles towards a screen with two slits, and detection occurs on a screen or detector. When both slits are open and no attempt is made to observe the path of each particle, after accumulating a large number of particles, an interference pattern forms on the screen, perfectly analogous to that observed in the case of waves. However, the most striking and counter-intuitive result appears when an attempt is made to observe or record which slit each particle passed through. In this case, the interference pattern vanishes and is replaced by a distribution corresponding to the behavior of classical particles, as if they had passed through either one or the other slit, never both simultaneously. This phenomenon underscores the fundamental effect of the act of measurement or observation on the behavior of quantum systems, confirming the statistical and probabilistic nature of quantum phenomena and serving as strong evidence for Heisenberg's Uncertainty Principle (Plotnitsky, 2010, pp. 57-65). Essentially, the double-slit experiment with individual particles provides the clearest experimental demonstration of wave-particle duality, superposition (the particle seems to pass through "both" when unobserved), and the central importance of measurement in quantum mechanics.

As an educational tool, the double-slit experiment offers the advantage of allowing qualitative understanding of its results, even without specialized technical knowledge of quantum theory. A full quantitative analysis, of course, requires the use of the mathematical formalism of quantum mechanics (Plotnitsky 2010). It is a particularly effective means for highlighting central quantum concepts, such as wave-particle duality, the probabilistic nature of measurements, and the phenomenon of wave function collapse (Plotnitsky, 2010· Sayer et al., 2017). Although understanding these concepts can present difficulties for many learners, the double-slit experiment maintains its reputation as one of the most instructive examples for approaching quantum physics (Sayer et. al 2017).

TEACHING SCENARIO

Teaching Scenario Title: "The Dual Nature of Light: A Journey into the World of Waves and Particles"
Thematic Unit: Waves and Light - Introduction to Quantum Theory
Grade: 9th Grade (Gymnasium)
Duration: 4 teaching hours (180 minutes)
Introduction/Rationale: The double-slit experiment is one of the most impressive and fundamental experiments in the history of physics. It reveals in a simple and direct way the quantum nature of matter and light, showing that particles (such as electrons or photons) can behave simultaneously as waves and particles. By teaching it in high school, we give students a first taste of the "strange" but fascinating world of quantum mechanics. The double-slit experiment challenges our classical understanding of reality and prompts students to think critically about the nature of matter.

Furthermore, it serves as an excellent starting point for introducing basic quantum concepts, such as wave-particle duality, without requiring complex mathematics.

Prerequisite Knowledge: To basically understand the double-slit experiment, students need to have some prior knowledge such as those presented in (Table 1).

Table 1
Prerequisite Knowledge

Basic understanding of waves	Know what a wave is and properties such as superposition and interference of waves (example: water waves).
Basic understanding of particles	Have a simple idea of what a particle is (e.g., a marble) and its classical behavior.

Advanced knowledge of physics or mathematics is not required. Teaching the double-slit experiment can be made understandable and fascinating even with simple words and analogies, as long as we focus on conceptual understanding rather than mathematical details.

Learning Objectives: The learning objectives are presented in (Table 2)

Table 2.
Learning Objectives

Cognitive	Students should be able to understand the phenomenon of interference and diffraction of waves. Students should be able to describe the double-slit experiment and its results. Students should be able to distinguish the nature of light (wave and particle). Students should be introduced to basic concepts of quantum theory.
Psychomotor	Students should be able to use simulations to investigate interference and diffraction phenomena. Students should be able to design and interpret interference diagrams. Students should be able to draw conclusions from experimental data and observations.
Affective/Social	Students should develop their critical thinking and problem-solving skills. Students should be able to collaborate in groups and exchange opinions. Students should wonder about the nature of reality and the limits of classical physics. Students should realize the evolution of scientific knowledge and the questioning of established ideas.

The equipment required for the teaching is listed in (Table 3).

Table 3.
Equipment required

Teaching Resources	Interactive whiteboard or projector Computers or tablets with internet access Student worksheets Educational videos (suggestions below) PhET Colorado Simulations: "Wave Interference - Interference, Double Slit, Diffraction" (https://phet.colorado.edu/en/simulations/wave-interference) Quantum Wave Interference" (https://phet.colorado.edu/en/simulations/quantum-wave-interference
Suggested Educational Videos (Indicative)	Το πείραμα της διπλής σχισμής. Double slit experiment. https://www.youtube.com/watch?v=ZeWAXsHCKTs&t=3s Double slit experiment (Through the Wormhole, S2E6), Anton Zeilinger https://www.youtube.com/watch?v=WAvqTOOyWGg The Weird Experiment that Changes When Observed https://www.youtube.com/watch?v=5kfGRO6msQw&t=324s

Lesson Flow (Scenario Phases): The instructional scenario consists of five phases as presented in (Table 5).

Table 4.
Scenario Phases

Phase 1: Introduction Activating Prior Knowledge & Creating Interest (30 minutes)	**Challenge Question**: "What do you know about light? Is it a wave or a particle? What evidence do we have for each case?" (Write answers on the board). Briefly discuss the historical views on the nature of light. **Recall Knowledge about Waves**: Briefly discuss the properties of waves (wavelength, frequency, amplitude, interference, diffraction) using simple examples (water waves, sound). We can show a short video depicting these phenomena in water waves. **Introduction to the "Mystery" of Light**: Show the video "Double slit experiment (Through the Wormhole, S2E6), (Anton Zeilinger)" which refers to the double-slit experiment (without explaining it yet). Ask: "What is happening here? Why does light create this pattern?" in order to create curiosity about the experiment.
Phase 2: Exploration Experimentation with PhET Simulations (60 minutes)	**Group Work**: Divide students into small groups (3-4 people). Each group works on a computer/tablet. **"Wave Interference" Simulation**: Instructions: Provide worksheets with instructions for the simulation. Ask students to explore the various options (water waves, sound waves, light). Focus on "Double Slit": Guide students to focus on the "Double Slit" option for water waves and light. Experimentation: Ask them to change parameters (e.g., slit separation) and observe how the interference pattern on the screen changes. Recording Observations: In the worksheet, ask them to draw the interference pattern they observe and describe what happens in words. Guiding questions: "What do you see on the screen? How does the pattern change when you change the wavelength? The distance between the slits?" **Group Discussion**: Each group discusses its observations and attempts to interpret the interference pattern based on their knowledge of waves.
Phase 3: Understanding – Explanation with Videos and Class Discussion (45 minutes)	**Show Educational Video**: Show the video: "Το πείραμα της διπλής σχισμής. Double slit experiment." Pause the video at critical points to explain or emphasize important concepts. **Explanation of the Double-Slit Experiment with Light:** **Wave nature of light**: Discuss how the double-slit experiment with light confirms the wave nature of light. Focus on the concept of interference and how bright and dark areas are created in the pattern. **Introduction of the concept of the photon**: Introduce the photon as the "particle" of light. Pose the question: "What will happen if we send photons one by one through the slits?" **"Quantum Wave Interference" Simulation:** Instructions: Open the "Quantum Wave Interference" simulation. Select "electrons" as particles (or "photons"). Experimentation: Set the simulation to "shoot" electrons (or photons) one by one through the double slit. Observe what happens on the screen. Discussion: "What do you observe? Is an interference pattern created again, even when we send the particles one by one? How is this possible?" **Dual Nature of Light and Matter**: Discuss the astonishing result: even "particles" like electrons and photons exhibit wave-like behavior and create an interference pattern! Introduce the concept of the wave-particle dual nature of light and matter in quantum mechanics. Refer to the scientists who studied the phenomenon.

Phase 4: Extension Critical Thinking, Philosophical and Social Implications (25 minutes)	**Question for Reflection**: "What does this mean for our understanding of reality? If particles behave as waves too, how can we describe them? Does observation affect reality?" **Discussions**: Discuss topics arising from quantum theory: The nature of light is singular and exclusively quantum: it consists of photons. Limits of classical physics: The double-slit experiment shows the limits of classical physics and the need for a new theory (quantum mechanics) to describe the microcosm. The Effect of Observation on the Understanding of Reality. **Social Implications**: Mention how quantum mechanics has led to technological revolutions (laser, transistors, computers, medical imaging). Emphasize the importance of basic scientific research, even if the applications are not immediately apparent.
Phase 5: Assessment Reflection and Consolidation (20 minutes)	**Brief Summary**: Ask students to summarize the main points they learned about the double-slit experiment and the nature of light. **Closed and Open-Ended Questions:** Closed-ended: E.g., "What pattern is created on the screen in the double-slit experiment with light? (a) A spot, (b) Two lines, (c) An interference pattern." Open-ended: E.g., "What is the most interesting idea you learned today and why? What question remained unanswered for you?" **Optional Homework**: Suggest students research more information about quantum physics, the double-slit experiment, or philosophical questions related to science. We can ask them to write a short text with their thoughts.

RESULTS AND CONCLUSIONS OF THE PILOT APPLICATION

The pilot implementation of the proposed teaching scenario, meticulously designed to introduce 9th-grade students to the seminal double-slit experiment and associated foundational quantum concepts through the strategic utilization of Information and Communication Technologies (ICT), yielded several significant findings that merit detailed discussion.

Firstly, and perhaps most notably, the pilot study unequivocally ascertained the feasibility of introducing and effectively teaching basic quantum concepts at the 9th-grade level. This includes core principles highlighted by the iconic double-slit experiment, such as wave-particle duality, the phenomena of interference and diffraction at the quantum scale, and the probabilistic nature of quantum events. This outcome directly challenges and offers a counter-narrative to the widespread, and often deeply entrenched, perception within educational circles that quantum theory is excessively complex, mathematically prohibitive, or conceptually unsuitable for students of this age group. The successful execution and testing of the scenario demonstrated compellingly that, when coupled with an appropriate pedagogical methodology and enabling technological tools, students possess the capacity to approach, engage with, and achieve a foundational comprehension of fundamental aspects of quantum behavior. This suggests that early exposure, when carefully scaffolded, can lay crucial groundwork for future scientific literacy.

Furthermore, the integration of ICT emerged as a central and indispensable factor in the overall success of the teaching scenario and the demonstrable enhancement of the student learning process. Specifically, the deployment of targeted educational videos to introduce concepts and the interactive PhET simulations ("Wave Interference" and "Quantum Wave Interference") to allow for exploration and experimentation, proved pivotal. The positive impacts observed through this ICT integration can be elaborated as follows: (1) Significantly Increased Student Interest and Motivation: Students exhibited a markedly heightened interest and curiosity in the subject matter. Quantum physics, often perceived by students as inherently inaccessible, counter-intuitive, or "exotic," became a topic of genuine engagement. The ability to visualize complex phenomena, such as wave interference patterns and the behavior of individual quanta, combined with the interactive and exploratory nature of the digital tools, appeared to effectively pique their curiosity, overcome initial apprehension, and sustain their attention throughout the learning modules. (2) Enhanced Active Participation and Collaborative Learning: A discernible increase in the active participation of students was recorded across various classroom activities. This included more robust engagement in discussions, a greater willingness to contribute ideas, and a more focused exploration of the simulations. The interactive elements of the digital tools seemed to empower students, encouraging them to ask probing questions, seek clarifications from both peers and the instructor, and

collaboratively make sense of the observed phenomena. This fostered a more dynamic and student-centered learning environment. (3) Facilitation of Deeper Conceptual Understanding: There were clear and compelling indications that the students developed an improved and potentially deeper conceptual understanding of the examined quantum phenomena. This was particularly evident in their grasp of the challenging concept of wave-particle duality and how this duality is experimentally manifested and observed through the double-slit experiment. The PhET simulations, in particular, played a crucial role by providing a virtual laboratory where students could manipulate variables and observe outcomes, thereby helping them to "visualize" highly abstract concepts and to forge meaningful connections between their direct observations within the simulated environment and the underlying theoretical principles. This visual and interactive bridge proved instrumental in demystifying complex ideas and fostering a more intuitive, rather than purely rote, understanding.

In essence, the pilot study provides strong preliminary evidence that a thoughtfully designed, ICT-enhanced approach can make the foundational concepts of quantum physics accessible and engaging for younger secondary school students, thereby opening new avenues for science education.

In summary, these preliminary findings strongly support the hypothesis that ICT possesses significant positive potential as tools for the effective teaching of the double-slit experiment and related quantum concepts at the Secondary Education level, paving the way for the introduction of quantum physics at an earlier stage of education. However, it is imperative to acknowledge the pilot and limited nature of the current implementation. These results, while encouraging, are initial indications and necessitate further extensive investigation and validation on a larger scale. Future research is required for the following reasons: (1) Evaluation on a Larger Scale: The application of the scenario is needed on a broader and more representative sample of students and in different school environments, to evaluate the generalizability of the findings and the effectiveness of ICT under varied conditions. (2) Examination of Influencing Factors: It is crucial to thoroughly investigate the various factors that may influence students' acceptance and understanding of these inherently abstract and often counter-intuitive scientific concepts. These may include their prior knowledge in physics, their learning profile, the overall use of ICT in the broader educational process, as well as the socio-cultural context. (3) Continuous Scenario Improvement: The results of expanded research should be used for the continuous improvement and adaptation of the teaching scenario, making it more effective and adaptable to the needs of students and teachers. (4) Long-Term Goal: The ultimate long-term goal of this research is to contribute to educational innovation in physics teaching and, more broadly, to enhance "quantum literacy" in society, starting by strengthening the teaching of quantum physics at the early stages of secondary education in Greece, thus bridging the gap with international trends.

FINAL CONCLUSION

Quantum physics, though complex, is fundamental to modern technology and understanding the universe, yet its foundational concepts, like those illustrated by the double-slit experiment, are not adequately addressed in Greek secondary education, leading to educational disparity. This study proposes and pilots an ICT-enhanced teaching scenario for 9th graders focusing on the double-slit experiment to address this gap. Preliminary results are promising, suggesting that introducing quantum ideas at this level is feasible and that tools like PhET simulations boost student interest, engagement, and conceptual understanding, particularly of wave-particle duality. While these findings highlight the potential of ICT in making abstract quantum phenomena more accessible, they also underscore the need for further large-scale research. Future work should broaden the study's scope, examine influencing factors on student learning, and refine the teaching methodology to promote wider quantum literacy.

In culmination, this study provides a compelling preliminary case for rethinking the approach to quantum physics education in Greek secondary schools. By strategically leveraging the power of ICT and adopting innovative pedagogical approaches, it is possible to introduce these fundamental concepts earlier and more effectively. The overarching aspiration is to promote wider quantum literacy, cultivate critical thinking skills, empower students with a contemporary scientific worldview, and thereby align Greek science education more closely with progressive international trends and the evolving demands of the 21st century.

ABSTRACT

This research paper examines the impact of integrating digital technologies into Physical Education teaching in secondary education, with particular emphasis on gamification and the use of virtual reality (VR) and augmented reality (AR).

Through collecting qualitative and quantitative data from 15 teachers and 60 students in schools managed by the Regional Directorate of Education of Western Greece, this study aims to evaluate how these technologies enhance student participation, motivation, and motor skill development.

The findings demonstrate that digital tools enhance the level of student interest and engagement, particularly among those who demonstrate a limited level of engagement within the conventional teaching paradigm. However, critical challenges have emerged, particularly with regard to providing teachers with adequate training and technical support.

The study concludes with recommendations for the pedagogically informed integration of technology in Physical Education, with a view to improving teaching quality and promoting educational equity.

Keywords: Digital technologies, physical education, gamification, virtual reality (VR), educational outcomes

INTRODUCTION

The integration of digital technologies into school education has become an integral part of modern teaching practice. These innovations are not confined to theoretical subjects; they also extend to physical education, offering novel possibilities through tools such as virtual reality (VR), augmented reality (AR) and gamification (Casey et al., 2017). The use of these technologies enhances the learning experience, rendering courses more engaging and interactive, thereby facilitating improvements in students' fitness and motor learning (Chen & Shen, 2021).

Contemporary studies posit that the integration of digital technologies into Physical Education can enhance student participation, particularly among those who demonstrate low engagement in the context of traditional teaching methodologies (Baek et al., 2020). Gamification, for instance, fosters environments in which students are motivated to participate through mechanisms of reward and progress (Zainuddin et al., 2020). Concurrently, VR and AR technologies can simulate exercise and sports performance conditions, facilitating the safe and accurate practice of complex skills (Wang et al., 2022).

Nevertheless, the successful integration of these technologies is contingent on the attitudes and competencies of the teaching staff. It has been reported by a significant number of teachers that they encounter difficulties when using digital media, primarily due to a lack of training or inadequate technical support (Kirkland & Sutch, 2009). Consequently, the investigation of these perceptions is imperative for the development of educational policies that can effectively facilitate technology integration in Physical Education (Papastergiou, 2009).

The objective of this research study is to examine the impact of digital technologies on the teaching of Physical Education, with a particular focus on the evaluation of the learning experience from the perspectives of both students and teachers. In particular, it seeks to investigate the impact of gamification, VR and AR on students' participation and motivation in physical activities (Chen & Shen, 2021) and evaluate their contribution to the enhancement of students' physical and sporting skills (Baek et al., 2020). It also aims to record teachers' views on the effectiveness and challenges of using digital media in teaching practice (Kirkland & Sutch, 2009), identify teachers' training needs for integrating technologies in a pedagogically sound way and, finally, highlight the benefits and limitations of technological integration in physical education, with the aim of making recommendations for improving teaching quality.

The aforementioned data form the research framework of the study, which seeks to answer key questions such as: What effect does the integration of digital technologies, such as gamification and virtual and augmented reality, have on students' participation in Physical Education lessons? How does the use of these tools contribute to improving students' sporting skills and physical condition? What are teachers' perceptions regarding the effectiveness of integrating digital technologies into physical teaching practice and the challenges that accompany this process? What training and technical support do teachers need in order to integrate these technologies into their teaching effectively? And finally, what difficulties have been identified by students and teachers when implementing these technological tools in PE lessons?

THEORETICAL FRAMEWORK

The integration of digital technologies in the teaching of Physical Education is an innovative and promising step towards upgrading the learning experience, as well as towards enhancing students' motor and sports skills. Virtual and augmented reality contribute to a more engaging and interactive learning environment by enabling students to participate in simulated sporting activities (Slater et al., 2020). Concurrently, wearable devices, such as smartwatches, provide real-time feedback, allowing students to monitor their progress and improve their fitness based on data collected during exercise (Swan et al., 2021). Nevertheless, the absence of adequate teacher training in the pedagogically informed use of digital tools, as well as the necessity for ongoing technical and administrative support, constitute significant obstacles to their full and effective integration into teaching practice (Hutchison & Reinking, 2011). Furthermore, ensuring that all students have equal access to technological infrastructure and tools is a key factor in avoiding educational inequalities and enhancing equal opportunities in the school environment (Kukulska-Hulme, 2012).

METHODOLOGY

Statistical Analysis

The statistical analysis of the data was conducted using SPSS software (version 25), with Microsoft Excel being used for preliminary data processing. In the descriptive part of the analysis, categorical variables are presented through absolute and relative frequencies, while quantitative variables are described by mean values and standard deviations. In

the inductive part of the study, a two-factor analysis of variance was employed, with one of the factors being repeated (two-way mixed ANOVA). The level of statistical significance in the inductive tests was set at $\alpha = 0.05$.

RESULTS

Demographic Characteristics

The present research study is comprised of a sample of 15 Physical Education teachers and 60 students from lower secondary (gymnasio) and upper secondary (lykeio) schools within the jurisdiction of the Regional Directorate of Primary and Secondary Education of Western Greece (PDEDE). Table 1 presents the demographic characteristics of the teaching staff. The majority of the participants are male (66.7%), while female teachers represent 33.3% of the sample. The mean age of the teachers is 40.2 years (Standard Deviation = 5.979), while the mean duration of professional experience in Physical Education teaching is 14.07 years (Standard Deviation = 5.325). It is noteworthy that all participating teachers have a minimum of five years of teaching experience.

Table 6.
Demographics of the participating teachers (N=15)

Questions	N	Percentage / M ± SD
Sex		
Male	10	66.7%
Female	5	33.3%
Age	15	40.2 ± 5.979
Years of experience in teaching Physical Education	15	14.07 ± 5.325

The demographic characteristics of the student sample are presented in Table 2. The majority of the subjects are male (58.3%), while the female population constitutes 41.7% of the sample. With respect to grade level, 55.0% of the sample attend lower secondary school (gymnasio), while 45.0% attend upper secondary school (lykeio). The mean age of the students was calculated at 15.4 years (Standard Deviation = 0.924).

Table 7.
Demographics of the participating students (N=60)

Questions	N	Percentage / M ± SD
Sex		
Male	35	58.3%
Female	25	41.7%
Grade level		
Lower secondary school	33	55.0%
Upper secondary school	27	45.0%
Age	60	15.4 ± 0.924

With regard to the use of digital tools in the teaching process, the majority of the teachers (66.7%) indicated that they employ them on occasion, while a smaller percentage reported infrequent use (20.0%) or frequent use (13.3%). Teachers were asked to identify the digital tools they have incorporated into their practice by answering multiple-choice

questions. The results are presented in two forms: firstly, as a percentage of the total number of participants, and secondly, as a percentage per individual cases. Wearable devices, including smartwatches, emerged as the most prevalent technology (33.3% of all teachers; 92.9% of category users), followed by gamification (28.2% | 78.6%), augmented reality (20.5% | 57.1%) and virtual reality (17,9% | 50,0%).

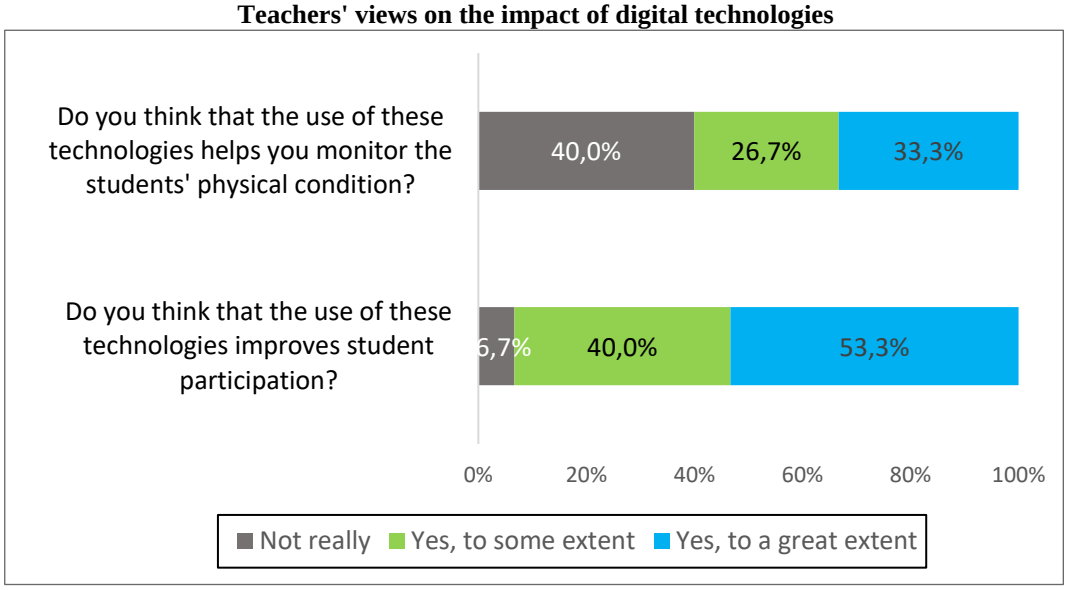
Table 8.
Use of digital tools by teachers

Multiple choice questions	Total response rate	Percentage per case
If you use tools such as the following, which ones have you tried to apply in your teaching?		
Gamification	28.2%	78.6%
Virtual Reality (VR)	17.9%	50.0%
Augmented Reality (AR)	20.5%	57.1%
Smartwatches or other wearables	33.3%	92.9%

The majority of students consider that digital technologies have a positive (66.7%) or very positive (18.3%) impact on PE lessons, while smaller percentages adopt a neutral (13.3%) or negative (1.7%) attitude. Overall, 85% of students positively received these technologies. Concurrently, 31.7% of students report using devices such as smartwatches or other similar wearable technologies. With regard to their preferences for the most appealing digital tools, gamification achieves the highest preference rate (61.7%), followed by VR with 23.3%, AR with 10.0% and, finally, wearable devices with 5.0%).

Table 9.
Students' preferences with regard to the use of digital technologies

Questions	N	%
What impact do you think digital technologies have had on Physical Education teaching?		
Negative	1	1.7%
Neutral	8	13.3%
Positive	40	66.7%
Very positive	11	18.3%
Are smartwatches or other similar wearables used in your PE lessons?		
Yes	19	31.7%
No	41	68.3%
Which of the following digital tools/methods do you like best?		
Gamification	37	61.7%
Virtual Reality (VR)	14	23.3%
Augmented Reality (AR)	6	10.0%
Smartwatches or other wearables	3	5.0%



Impact of digital technologies

Teachers have asserted that the integration of digital technologies facilitates the monitoring of students' fitness, with 33.3% rating them as very useful and 27.6% as useful to some extent. The majority of participants (60%) consider that these technologies contribute significantly to the monitoring of students' physical performance, while the remaining 40% do not consider them to be particularly useful for this purpose. Concurrently, the majority of teaching professionals posit that these technologies enhance student engagement in Physical Education, with 53.3% reporting a significant improvement and 40.0% a moderate improvement. A mere 6.7% of respondents did not observe any change in student engagement.

Table 10.
Teachers' views on the impact of digital technologies

	Not really	Yes, to some extent	Yes, to a great extent
Do you think that the use of these technologies helps you monitor students' physical condition?	40.0%	26.7%	33.3%
Do you think that the use of these technologies improves student participation?	6.7%	40.0%	53.3%

Graph 4.
Teachers' views on the impact of digital technologies

Teachers have been found to offer a favourable assessment of the contribution of digital technologies in enhancing sports skills among students. Specifically, 40.0% of the participants consider that the technologies contribute to a very large extent, while 26.7% consider that their impact is moderate. A further 26.7% of respondents attribute a very positive impact to technologies, while only 6.7% consider their contribution to be limited.

At the same time, students were invited to respond to a series of questions regarding the use of digital technologies in PE lessons, employing a five-point scale to gauge their level of agreement or disagreement (1: Strongly agree, 2: Agree, 3: Neutral, 4: Disagree, 5: Strongly disagree). As demonstrated in Table 6 and Graph 3, the mean agreement value for the statement “The use of digital technologies makes PE classes more fun” was found to be the highest (M = 4.02). This was followed by the statement “The use of digital technologies makes me want to participate more in PE classes” (M = 3.90). Furthermore, the responses ranged from neutral to agreement for the statements “The use of digital technologies in PE motivates me to exercise outside of school” (M = 3.62) and “The use of digital technologies helps me to improve my physical condition” (M = 3.57).

As illustrated in Table 7, teachers' perspectives on the obstacles and needs related to the use of digital technologies in physical education teaching are elucidated. A mere 13.3% of the participants stated that they had undergone training on the use of these technologies. The primary obstacle identified by teachers is the lack of appropriate equipment (73.3%), followed by a lack of technical support (20.0%) and insufficient training (6.7%). With regard to the necessity for supplementary training and support, 33.3% of teachers consider it to be quite necessary, while 6.7% regard

it as very necessary. This indicates that, in total, 40% of respondents recognise a need for such support, in contrast to the 60% who do not perceive a particular necessity for it.

Graph 5.
Teachers' views on the impact of digital technologies on students' sports skills

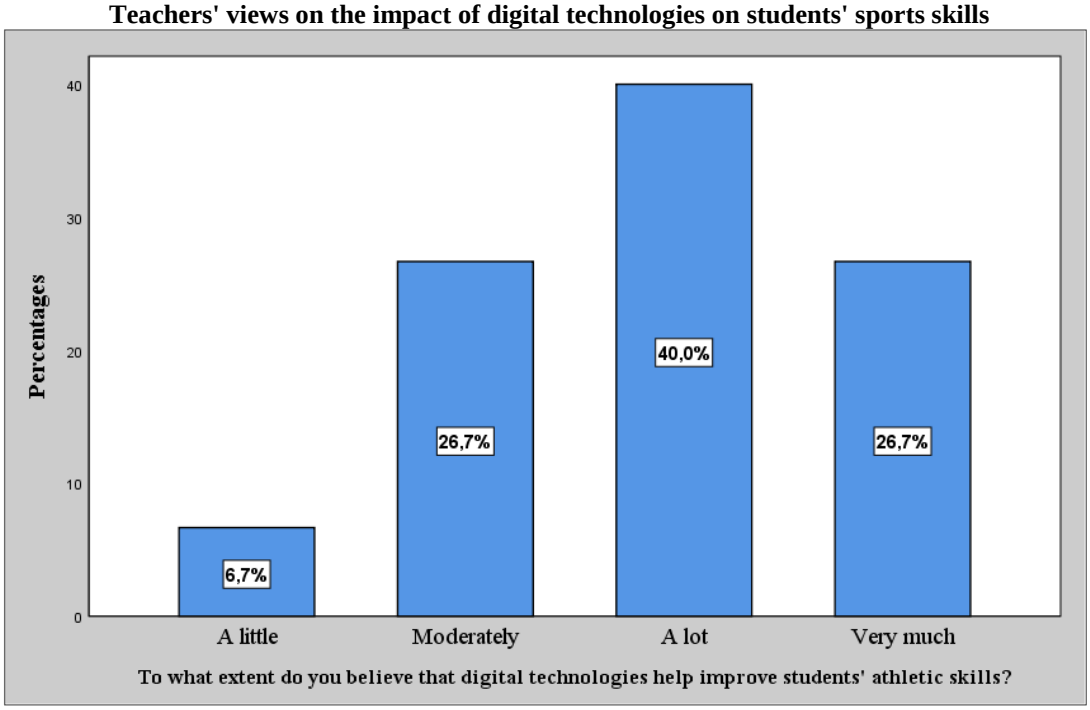


Table 11.
Means and standard deviations for students' views on the impact of digital technologies

The use of digital technologies…	Mean Values	Standard Deviation
… makes me want to participate more in PE classes	3.90	0.796
… makes PE classes more fun	4.02	0.854
… motivates me to exercise outside of school	3.62	0.922
… helps me improve my physical condition	3.57	0.927

Improving student endurance

The students' endurance levels were evaluated using the Cooper test, which involves a fixed running time of 12 minutes and participants are asked to run the maximum distance possible within this time frame. Two measurements were used for the analysis: the first from the previous semester and the second from the current semester. Furthermore, the sample was divided into two groups according to the use of mobile devices (smartwatches or others) during sport. Two-factor analysis of variance (two-way ANOVA) revealed a statistically significant effect of the factor 'Time' ($F(1,58) = 138.872$, $p < 0.001$), with the overall sample showing an improvement in distance travelled from the previous ($M = 2254.6$ m) to the current semester ($M = 2492.8$ m). In addition, a statistically significant interaction was identified between the factors 'Time' and 'Device use' ($F(1,58) = 104.364$, $p < 0.001$), suggesting a differential evolution of performance depending on the use of mobile devices. As demonstrated in Table 8 and Graph 4, students using smartwatches or other mobile devices exhibited an average enhancement of 20.0%, while the remaining students demonstrated an average improvement of 1.4%.

Graph 6.
Means and standard deviations for students' views on the impact of digital technologies
Obstacles presented and needs' analysis of teachers

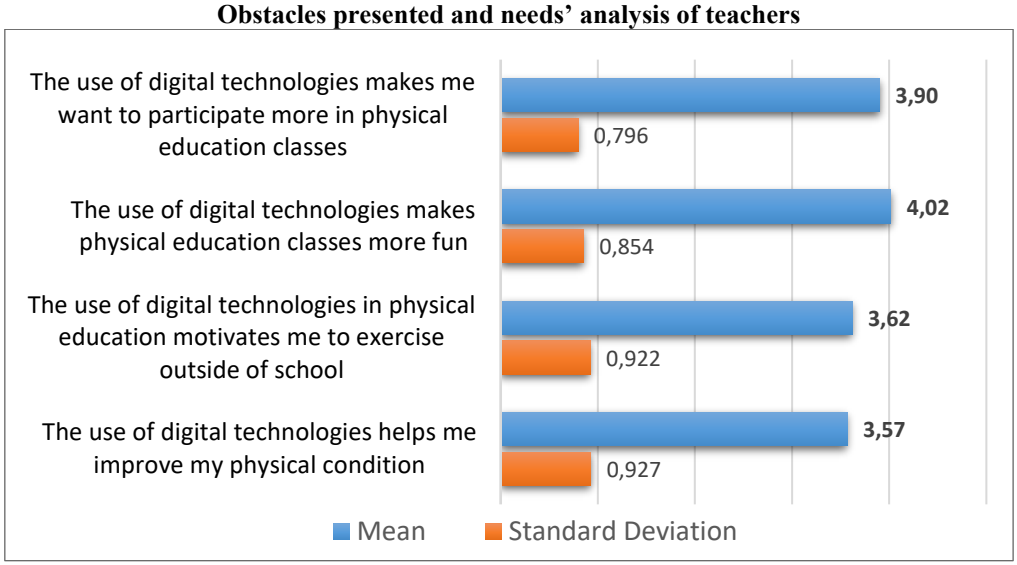

Table 12.
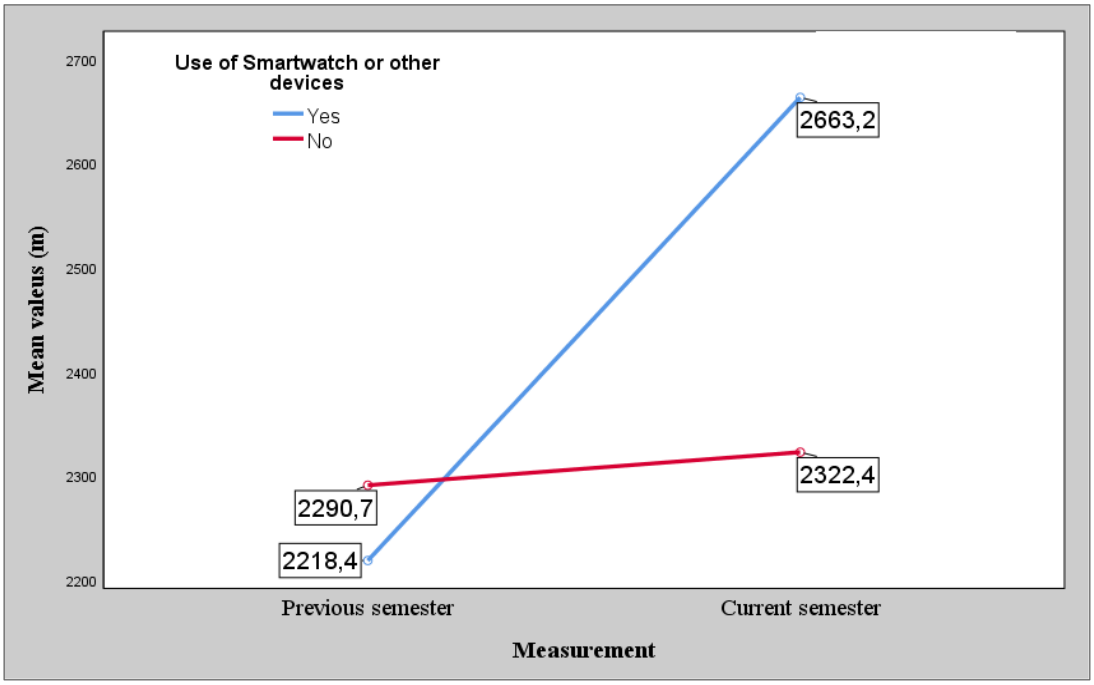
Teachers' views on the obstacles to using digital technologies and their training needs

Questions	N	%
Have you attended any training courses on the use of digital technologies in Physical Education?	PP	
Yes	2	13.3%
No	13	86.7%
What is the most important obstacle encountered when using digital technologies in Physical Education?		
Lack of appropriate equipment	11	73.3%
Lack of technical support	3	20.0%
Lack of training	1	6.7%
Do you think it is necessary for teachers to receive additional training and support in order to use these tools?		
Not particularly necessary	9	60.0%
Quite necessary	5	33.3%
Absolutely necessary	1	6.7%

MAIN FINDINGS – CONCLUSIONS



The study by Swan et al. (2021) supports the effectiveness of wearable devices in monitoring student fitness, as they provide teachers with accurate data, enabling them to tailor exercise programmes to each student's needs. In this study, teachers confirmed that using these devices facilitates progress monitoring and enhances students' self-esteem. These findings align with those of Slater et al. (2020) and Hutchison and Reinking (2011), which emphasise the positive influence of digital tools on student participation and engagement, particularly through virtual reality and gamification. The use of such tools fosters an interactive and motivating learning environment that promotes active participation and engagement, as Zichermann and Cunningham (2011) report, noting that students who participate in activities with gamified features show enhanced performance. However, the teachers in this study also articulated a need for more

support and professional development to enable them to use technologies more effectively. These challenges are consistent with the literature, as Hutchison and Reinking (2011) point out that successful integration of technology into the educational process requires teacher training, technical support and reliable infrastructure.

Table 13.
Mean values on Cooper test measures among students based on their use of smartwatches or other mobile devices

	Previous semester	Current semester	Percentage change
Use of smartwatches or other devices	2218.4	2663.2	20.0%
Without using devices	2290.7	2322.4	1.4%

Graph 7. Mean values on Cooper test measures among students based on their use of smartwatches or other mobile devices

CONCLUSIONS – RECOMMENDATIONS

This study emphasised the vital role of digital technologies, particularly gamification, virtual reality, and mobile fitness monitoring applications, in enhancing the pedagogy and learning outcomes of Physical Education. These technologies have not only served as innovative support tools, but have also shaped a new educational paradigm centred on active, experiential and personalised learning. The findings of the data analysis demonstrated that the gamification approach resulted in enhanced levels of engagement, motivation and collaboration among students, including those who had previously shown little interest in PE lessons. Concurrently, virtual reality offered safe simulations, providing new forms of interactive, multimodal learning that enhance cognitive and motor development. Furthermore, wearable technology and mobile applications enabled continuous self-monitoring, personalised feedback and targeted interventions, thereby improving students' physical performance and psychosocial empowerment.

Nevertheless, the implementation of these technologies is not without obstacles. The key challenges that have emerged in this context include inadequate infrastructure and equipment, lack of specialised training and resistance from teachers, due either to insecurity or limited technical support. In order to address these challenges and to ensure sustainable integration of technologies in PE, it is suggested that teachers should receive continuous professional development

through systematic training programmes focused on the use of tools such as virtual reality, gamification and digital measurement applications, so that teachers acquire the necessary technical and pedagogical skills (Voogt et al., 2015).

Concurrently, it is imperative to reinforce the technological infrastructure within educational institutions, as the implementation of educational programmes requires modern equipment, mobile devices, motion sensors and high-speed internet access, which are indispensable for the effective integration of technologies (Selwyn, 2012). Furthermore, the promotion of personalised learning through digital media can allow students to follow personalised learning pathways, set their own goals and progress at their own pace, enhancing their autonomy and self-esteem (Tomlinson, 2014). The implementation of pilot actions and research interventions through innovative action-research programmes can help evaluate the effectiveness of technologies and develop good practices (Hattie, 2009).

In conclusion, the establishment of partnerships with the community and external stakeholders, including parents, health and technology professionals, local authorities and universities, has been demonstrated to enhance educational programmes, thereby affording them social legitimacy and multi-level support (Fullan, 2007).

ASIA MINOR CATASTROPHE AND ASIA MINOR MONUMENTS: AN EDUCATIONAL INITIATIVE USING DIGITAL TOOLS

Giannouli Sofia
Philologist, PE02
1st Model Junior High School of Preveza with Lyceum Classes
Preveza, Greece
e-mail: alexandropoulosalekos@yahoo.com

ABSTRACT

This paper examines an educational initiative by the History student club titled "Asia Minor Catastrophe and Asia Minor Monuments", which was implemented at the 1st Model Junior High School of Preveza during the school year 2022-2023. The initiative aimed to foster a deeper understanding of both the history and memory of the Asia Minor Catastrophe by integrating innovative digital tools into the educational process. The paper analyzes how the use of technology enhanced the understanding of historical events, enabling students to approach and present history in a contemporary and interactive manner.

The methodology employed included the use of digital platforms for searching, analyzing, and processing historical sources, as well as developing student projects and creating presentations using presentation software (e.g., PowerPoint). Concurrently, digital tools were utilized for gathering photographic material, designing digital posters, and organizing digital events. A significant phase of the program involved the creation of a song, which was composed and produced using music software (such as GarageBand and FL Studio), alongside the development of a digital radio program where students presented historical data through a modern communication medium.

The main findings indicate the positive impact of using digital tools on enhancing student collaboration and creativity. The application of technological tools allowed students to participate actively in all phases of the project, strengthening critical thinking and their ability to produce digital content. Notably, the creation of the song and the digital radio program served as a highlight of the learning process, effectively combining music and historical memory with technology and offering students a powerful avenue for creative expression.

The results demonstrate that the combined use of traditional teaching methods and digital tools significantly enhances the educational process, equipping students with valuable skills for the modern era. Students developed competencies in critical thinking, expression, and collaboration within a digital environment, gaining experiences that reinforce their capacity to approach historical topics creatively and contemporarily.

Keywords: Asia Minor Catastrophe, historical memory, digital tools.

INTRODUCTION

The Asia Minor Catastrophe and its consequences are significant historical events that continue to affect Greece and Turkey today. The historical memory surrounding this catastrophe and the displacement of the Greeks of Asia Minor constitute a fundamental element of the national and collective identity of the Greeks. However, the study and teaching of these events are not limited to transmitting classical teaching methods but require adopting innovative approaches to make historical knowledge more accessible and comprehensible to students.

This paper examines the student initiative of the History club at the 1st Model Junior High School of Preveza, titled "Asia Minor Catastrophe and Asia Minor Monuments". The aim of this initiative was to enhance students' historical knowledge and memory of the Asia Minor Catastrophe, combining traditional teaching methods with the use of digital tools and new technologies. By integrating these tools into the educational process, students had the opportunity to approach history in a more interactive, creative, and contemporary way. The paper analyzes the methods used, the educational practices followed, and the results of this educational action.

HISTORICAL CONTEXT AND PURPOSE OF THE INITIATIVE

The Asia Minor Catastrophe (1922) was a defining event in the history of Hellenism. The study of this catastrophe has multiple dimensions: political, social, and cultural. Its consequences were catalytic for the Greek population of Asia Minor, as well as for the relationship between Greece and Turkey. Therefore, preserving the memory of the Asia Minor Catastrophe is fundamental for national consciousness and understanding its historical and social impacts.

The Asia Minor Catastrophe resulted from a series of strategic and political failures that occurred during the Asia Minor Campaign in 1922. The defeat of the Greek army in confrontation with the Turkish army, combined with the failure of the plan to establish a Greek state in Asia Minor, led to the collapse of the Greek presence in the region. This defeat resulted in a broader humanitarian crisis, with hundreds of thousands of Greeks, mainly from Asia Minor and Pontus, being forced to abandon their homes and seek refuge in Greek territory. Their displacement reached massive proportions, leading Greece to receive a large wave of refugees, primarily in the southern regions and Western Macedonia, but also in other areas of the country, which were forced to adapt to the needs of this new demographic composition (Agantzidis, 2012).

Preveza was one of the cities that received refugees after the Asia Minor Catastrophe of 1922. From that year onwards, the city witnessed a significant demographic shift, as a large number of Greek refugees from Asia Minor and Pontus settled in the area, bringing about substantial changes in its social and economic structure. These refugees brought with them, besides their forced removal from their homes, a rich cultural and social heritage, which included their culture, traditions, linguistic peculiarities, and religious beliefs (Anagnostopoulos, 2005). These elements of the Asia Minor and Pontian heritage were integrated and interacted with the existing culture of Preveza, enriching the composition of the local society. This interaction had long-term effects, as the refugees contributed to the renewal and restructuring of the city's social, cultural, and economic aspects. The cultural richness of the refugees, expressed through their music, gastronomy, customs, and arts, not only enriched the local society but also contributed to preserving a vibrant memory of their historical heritage, which has been preserved and continues to influence the contemporary cultural identity of Preveza (Petmezas, 2001).

The educational initiative of the student History club aimed to integrate modern technology into the presentation of these historical events, enhancing students' awareness of historical memory and creating new, more contemporary teaching methods.

THE CONTRIBUTION OF REFUGEES TO PREVEZA

Preveza, as a coastal city on the Ionian Sea, became a natural destination for many refugees who, after the Asia Minor Catastrophe of 1922, sought a new beginning and refuge away from their homes. Their integration into the local community, however, was not without challenges. The refugees, who had suffered a significant humanitarian crisis, faced serious difficulties in adapting, primarily due to the lack of basic resources, the inability to find housing and employment, as well as social and cultural differences with the already established population of the city. Despite the adverse conditions, the refugees managed to organize new communities and gradually integrate into the social and economic life of Preveza (Anagnostopoulos, 2005; Garidis, 2015).

Specifically, the refugees from Asia Minor and Pontus brought with them a rich cultural heritage, which, although initially alien to the local community, gradually began to integrate into the cultural life of the city. Their music, gastronomy, dances, and traditions became fundamental elements of daily life, enriching Preveza's cultural landscape. Particularly, the musical tradition of the refugees, with songs and tunes originating from Asia Minor and Pontus, left an indelible mark on the local music scene, shaping musical preferences and influencing the collective identity of the city (Tsirpanlis, 1994; Papadopoulou, 2010).

The preservation and dissemination of this musical heritage is evident in various local events and festivals, where the traditional sounds of Asia Minor and Pontus continue to coexist with the other cultural elements of the region, offering a rich and multifaceted cultural identity. In this way, the refugees contributed to the enriched cultural character of Preveza, fundamentally influencing its social and cultural development (Garidis, 2015; Anagnostopoulos, 2005; Papadopoulou, 2022).

THE EDUCATIONAL INITIATIVE AND THE USE OF DIGITAL TOOLS

The educational initiative of the History student club at the 1st Model Junior High School of Preveza, implemented during the 2022-2023 academic year, focused on integrating the historical memory of the Asia Minor Catastrophe and the refugees using modern digital tools. The goal of the initiative was for students to approach the historical events of 1922 and their historical dimension by combining historical knowledge with contemporary technology, in order to create digital projects that reflected the history, memories, and experiences of the refugees.

The use of digital tools constituted one of the main pillars of the program. Students used presentation tools, such as PowerPoint and image editing software, to create detailed and comprehensive presentations about the Asia Minor Catastrophe and its monuments. Through these tools, students researched the historical period, processed visual material, and highlighted the significance of refugee testimonies and the preservation of historical memory (Papanikolaou, 2019; Selwyn, 2016; Raptis & Rapti, 2011).

Furthermore, students created a digital photo album containing photographs and historical material related to the local refugees of Preveza. This album served as a dynamic and touching retrospect into the history of the refugees, showcasing their contribution to the local community and capturing their personal stories and memories. The students undertook the collection and processing of these photographs, focusing on the value of historical documentation and the preservation of collective memory.

Notable was also the creation of a song, which represented a unique artistic approach by the students to express the feelings and memories of the refugees. The lyrics were written by the supervising teacher, who, influenced by the significance of the historical event, also referenced the 100 years since the Asia Minor Catastrophe. The musical composition of the lyrics was carried out with the help of digital tools, such as GarageBand and FL Studio software. This process offered students the opportunity to combine music with history, creating a work that not only expressed the refugees' emotions but also inspired them to discover new forms of expression and creativity. This music was incorporated into the educational events and the presentation of their work, enhancing the emotional and historical dimension of the program.

As part of the initiative, students also conducted interviews with four refugee families in Preveza, who originated from Asia Minor and Pontus. These interviews constituted an extremely significant process, as students had the opportunity to hear firsthand the personal stories of the refugees and understand the challenges and difficulties they encountered in their attempt to integrate into their new homeland. These interviews were recorded and integrated into the educational process, allowing students to process and analyze the historical testimonies and experiences of the refugees.

The use of digital tools was not limited to merely recording historical information. The digital presentation of these projects through events, such as the radio program, constituted one of the most creative stages of the program. Students presented the results of their research on the Municipal Radio Station of Preveza, where they discussed the integration of refugees into the city and their living conditions. Through their participation in this radio broadcast, students were able to communicate their work to a wider audience and offer listeners a thorough account of the refugees' historical journey and their contribution to Preveza. This broadcast, as a contemporary means of communication, brought historical memory into the present, offering a vivid picture of the refugee experience, while simultaneously enhancing the local community's awareness of the value of refugee history (Kapsalis, 2010).

The integration of these modern digital tools into the educational process provided students with the opportunity to develop skills related to critical thinking, research, collaboration, and expression through digital media. The creation of posters, digital photo albums, and interviews constituted a significant educational experience that contributed to strengthening students' historical and cultural consciousness, while the presentation of their work through the radio program reinforced the connection between historical memory and contemporary means of communication.

EDUCATIONAL BENEFITS AND SOCIAL IMPACT

The educational initiative developed at the 1st Model Junior High School of Preveza, focusing on the historical memory of the Asia Minor Catastrophe and the integration of refugees into the local community, offered students valuable educational benefits that enhanced their skills in various areas. The combination of traditional teaching methods and modern digital tools was a powerful factor in developing competencies that are not limited to the field of history but extend to broader areas of contemporary education.

1. Development of Critical Thinking and Creativity.

The students' engagement with creating digital projects, such as presentations, interviews, and multimedia material, significantly enhanced their creativity, as it encouraged them to move beyond stereotypes and the narrow boundaries of traditional teaching. Writing lyrics for the song, composing musical pieces, and producing various digital applications were processes that activated their imagination and allowed them to express themselves through new forms of art and communication. Through these activities, the students not only developed their creative thinking but also experienced a more experiential and meaningful form of learning.

At the same time, important skills of critical thinking, analysis, and synthesis were cultivated—skills necessary for a deeper understanding of historical events and for connecting them with contemporary reality. They were not merely limited to knowing the facts of the Asia Minor Catastrophe; instead, through the research process, they developed the ability to evaluate, compare, and analyze the consequences of the Catastrophe on the local community of Preveza.

Exploring the history of the refugees, collecting and interpreting data regarding their settlement and integration in the city, as well as searching for personal stories and testimonies, prompted them to approach the events from different perspectives. In this way, they cultivated empathy, historical awareness, and a more multidimensional understanding of the past—elements that contribute substantially to shaping active and critically thinking citizens.

2. Development of Collaboration and Communication Skills

The development of collaborative skills was a key element of the project, as the students worked in groups and shared different roles and responsibilities. Through this process, they cultivated coordination, mutual support, and a sense of collective responsibility. At the same time, the need to organize their work, plan the steps, and manage the available time contributed significantly to the development of organizational skills.

Their participation in the radio broadcast was also particularly important. Presenting their research and highlighting the stories of the refugees through a modern means of communication strengthened their ability to express themselves with clarity and confidence. The experience of public presentation was one of the most vivid and dynamic moments of the program, as the students had the opportunity to address a wider audience, simultaneously enhancing their communication and public relations skills.

Overall, the project demonstrated how essential collaboration, cooperative learning, and effective communication are within the school environment, offering students experiences that foster their personal and social development.

3. Enrichment of Historical Knowledge and Cultural Consciousness

The in-depth exploration of the historical memory of the Asia Minor Catastrophe and its integration into the educational process allowed students to realize the importance of preserving historical and cultural heritage. Through the digital recording of testimonies and the creation of interviews with refugee families, students came into direct contact with the human dimension of history, understanding the difficulties faced by refugees and the significance of their integration into the local community.

The preservation of the refugees' cultural heritage through traditions, music, and personal stories was a significant element of the teaching process. Students' participation in the production of musical works and the creation of digital photo albums contributed to the consolidation of this cultural consciousness, while simultaneously offering a contemporary way to understand the value of the past in the development of Preveza's identity and culture.

4. Development of Contemporary Skills

The use of digital tools provided students with the opportunity to acquire contemporary skills that are essential for their participation in the digital society. Familiarity with tools such as PowerPoint, image editing software, GarageBand, and FL Studio enhanced their IT skills, while their involvement in digital content production processes equipped them with useful knowledge for the future. These skills are crucial for their success in the digital age and for their development as responsible and creative citizens.

5. Social Impact and Community Participation

Through the radio broadcast, the events, and the dissemination of their digital creations, the students made a substantial contribution to raising social awareness within the local community of Preveza. The active participation of refugees in the interviews and the presentation of their personal experiences strengthened the sense of social solidarity and community cohesion, making the local society more sensitive to issues of historical memory and the refugee experience.

This initiative highlighted the role of education as a bridge between past and present, as a means of promoting creativity, and as a force that supports a society which respects its history, recognizes the value of cultural heritage, and cultivates cooperation and social cohesion. At the same time, the project was not confined to the limits of the school community but gained a broader social dimension, encouraging communication with the local community and fostering a climate of mutual understanding and acceptance of diversity.

Overall, the combined use of traditional teaching methods with digital tools not only enhanced the educational process but also offered students a holistic approach to learning, preparing them for the challenges of the modern world.

CONCLUSION

The project "Asia Minor Catastrophe and Asia Minor Monuments," implemented by the History student club of the 1st Model Junior High School of Preveza during the academic year 2022-2023, demonstrates the multifaceted value and positive impact of using digital tools in the educational process. This initiative, which combined the study of the historical memory of the Asia Minor Catastrophe with the use of modern technological means, provided students with rich educational benefits that will accompany them throughout their educational journey and beyond.

The utilization of digital tools and their integration into a program that combined history with art, music, and contemporary forms of communication, offered students the opportunity to develop skills essential for their participation in the modern world. The use of tools such as PowerPoint for creating presentations, music composition software like GarageBand and FL Studio, and their involvement in digital events and broadcasts, enhanced the understanding of historical events in an innovative and interactive way.

Beyond its technological dimension, this initiative contributed decisively to strengthening historical memory and cultural heritage, particularly concerning the Asia Minor Catastrophe, and highlighted the importance of preserving this memory for future generations. Through conducting interviews, digitizing photographic documents, and setting lyrics commemorating the 100 years since the catastrophe to music, students came into direct contact with history, approaching it from a personal and emotional perspective.

The integration of technology into the educational process is not limited to enhancing the understanding of historical events but offers students an opportunity to develop creative and social skills. Students actively collaborated in the production of digital projects, thus developing their capacity for teamwork, communication, and creative expression. Their participation in radio broadcasts, the creation of digital posters and invitations, as well as the presentation of their work at local events, provided students with the opportunity to express themselves within a broader social context, reinforcing their sense of social participation and responsibility.

A distinct characteristic of this educational approach was its focus on the historical memory of the Asia Minor Catastrophe, which was a significant event for Greece and its people. Referencing the 100 years since the catastrophe offered students the opportunity to examine the impact of this event on the local community of Preveza and other areas of Greece, providing a new dimension to their understanding of history.

Undoubtedly, the results of the initiative demonstrate the positive impact of digital tools on the educational process. Their integration not only improves the understanding of history but also empowers students' skills and prepares them for the contemporary demands of the digital world. Furthermore, the combined use of traditional and digital teaching methods allows students to approach historical and social issues in a new, innovative, and interactive way, making them aware of the value of historical memory, cultural heritage, and their social responsibility.

In conclusion, the initiative "Asia Minor Catastrophe and Asia Minor Monuments" is an excellent example of how education can combine history with technology, creating a unique learning experience for students and enhancing their knowledge not only in the field of history but also in areas such as collaboration, creativity, and digital literacy.

MUSIQUE CONCRÈTE AS AN INSTRUMENT FOR DIGITAL STORYTELLING: AN ELECTROACOUSTIC COMPOSITION WORKSHOP WITHIN THE FRAMEWORK OF THE MUSIC ENSEMBLES COURSE

Dimitrakopoulos Aristotelis
PhD Candidate at Ionian university, Substitute Secondary Education Teacher, Composer
Music School of Preveza, Greece

ABSTRACT

This scientific article explores the integration of Musique Concrète within the educational methodology of digital storytelling, examining the potential for integrating pre-designed sound into narrative practice. The emergence of Musique Concrète marked the advent of an era of experimentation in 20th-century music composition, with its fundamental tools consisting of digital processing, modification, and the re-arrangement of pre-recorded sounds. Its defining characteristic was the subversion of conventional boundaries in "traditional composition", as it challenged strict musical rules and fostered the formation of diverse soundscapes. Concurrently, the concept of digital storytelling is examined as an educational tool, which combines the use of technological means into the educational process with exploratory learning and reflection to formulate a structured and engaging narrative.

The composition workshop, which has been developed within the framework of the Music Ensembles' course in Music Schools, investigates methods through which students can develop their musical-narrative skills. This is achieved -not through the use of speech and visual media- but by employing sound design and the formation of original compositions in the model of Musique Concrète.

In order to develop the research objectives, the methodological axis of autoethnography is utilised, through which the teacher designs and modifies the lesson plan, balancing between the didactics of technical means and the philosophy of composition. The free software (DAW) Audacity is implemented for digital sound editing, and the Soundcloud streaming service is employed for archiving and cataloguing the students' compositions.

The research project focuses on the teaching of Musique Concrète to students from Middle and High School of Greek Music Schools, with a view to stimulating imagination, promoting collaborative work and deepening students' understanding of sound as a unique material for a storytelling. The overarching objective of the workshop is the composition of original music by the students themselves. This endeavour is of twofold significance: firstly, it serves as an inaugural portfolio for future reference; secondly, it amalgamates the elements of narration and sound design in the nascent stages of the sonification process. Furthermore, students' utilisation of the free software (DAW) Audacity for sound design enhances their technological proficiency and promotes the use of digital tools in the educational process. Simultaneously, the paper proposes an extension to the the curriculum of the Music Ensembles' course, with the aim of enhancing the educational goals of artistic expression and creation. Consequently, it presents the compositional process as an educational methodology that encourages creativity, digital literacy and technical proficiency.

Keywords: digital storytelling, electroacoustic composition, music education, digital literacy

INTRODUCTION

The rapid expansion of digital technologies has significantly reshaped contemporary music education, introducing innovative pedagogical approaches that enhance creativity, participation, and interdisciplinary learning. As music classrooms increasingly integrate digital tools, educators are exploring new methods to engage students in active, experiential, and reflective artistic practices. Within this evolving educational landscape, sound is no longer perceived solely as a musical element but as a narrative medium capable of conveying meaning, emotion, and storytelling. This shift invites renewed attention to electroacoustic practices and experimental composition as powerful frameworks for teaching musical expression in the digital age. Musique Concrète, a compositional approach that emerged in the mid-twentieth century, represents a pivotal transformation in the history of music. By employing recorded environmental sounds as primary compositional material, Musique Concrète challenged traditional Western musical norms centered on notation, pitch hierarchies, and instrumental performance. Instead, it introduced techniques of sound recording, editing, manipulation, and reassembly, allowing composers to construct meaning through sonic texture, rhythm, and timbre. The practice redefined the boundaries of composition by embracing noise, everyday sound, and technological mediation, ultimately expanding the aesthetic and conceptual possibilities of music creation.

At the same time, digital storytelling has gained prominence as an educational methodology that combines narrative thinking, technological literacy, and creative production. Digital storytelling encourages learners to construct structured narratives through multimedia elements such as sound, image, text, and video, fostering critical thinking, collaboration, and reflective learning. While many applications of digital storytelling emphasize spoken narration or visual media, the role of sound as an independent narrative force remains underexplored. Sound possesses unique expressive capabilities: it can suggest atmosphere, shape temporal flow, evoke memory, and guide emotional interpretation without relying on verbal language.

This study positions Musique Concrète as a methodological bridge between electroacoustic composition and digital storytelling, proposing sound-centered narrative creation as an innovative educational practice. Specifically, it examines an electroacoustic composition workshop implemented within the Music Ensembles course in Greek Music Schools. The workshop introduces students to the artistic principles of Musique Concrète while engaging them in the process of designing sonic narratives using recorded and manipulated sound material. Rather than composing through conventional musical notation or instrumental performance, students construct original compositions through sound design, layering, transformation, and montage. The pedagogical framework of the project is grounded in autoethnographic methodology, enabling the teacher-researcher to design, evaluate, and refine the learning process through reflective practice. This approach allows for a dynamic balance between technical instruction - such as digital audio editing - and philosophical inquiry into the nature of sound, listening, and composition. The free digital audio workstation Audacity serves as the primary tool for sound processing, while the SoundCloud platform functions as an archive and dissemination space for students' final works, reinforcing both digital literacy and creative ownership.

The target group consists of middle and high school students enrolled in Greek Music Schools, with the broader educational objective of fostering imagination, collaborative creativity, and critical listening skills. Through hands-on engagement with sound recording and electroacoustic composition, students develop an understanding of sound as a raw narrative material capable of structuring meaning and storytelling. The workshop culminates in the production of original compositions that serve both as a creative portfolio and as an introduction to sonification and sound-based narrative thinking.

By integrating Musique Concrète into digital storytelling pedagogy, this research contributes to the expansion of music education beyond traditional performance-based models. It proposes composition as an exploratory learning process that strengthens creativity, technical competence, and digital fluency, while also enriching the Music Ensembles curriculum with contemporary artistic and technological perspectives.

MUSIQUE CONCRÈTE: HISTORICAL AND THEORETICAL FRAMEWORK

Musique Concrète emerged in the mid-twentieth century as a radical departure from traditional Western compositional practices, fundamentally redefining the relationship between sound, technology, and musical meaning. Pioneered by French composer and theorist Pierre Schaeffer in the 1940s, Musique Concrète introduced a compositional paradigm based on the manipulation of recorded sounds rather than the abstraction of musical notation. Schaeffer's seminal work Traité des objets musicaux established the conceptual foundation of this practice, proposing the notion of the sound object (objet sonore)—a sound perceived independently from its source or cause (Schaeffer, 1966). Through this framework, listening becomes an analytical and phenomenological act, emphasizing sonic texture, duration, and timbral qualities over traditional harmonic or melodic structures.

Central to Schaeffer's theory is the concept of reduced listening (écoute réduite), which encourages listeners to focus on the intrinsic properties of sound rather than its referential or symbolic associations. This approach marked a shift from representational to perceptual listening, allowing composers to explore sound as autonomous material. In this sense, Musique Concrète did not merely introduce new compositional techniques; it proposed a reorientation of musical thought, situating listening itself as a core creative and epistemological process.

Subsequent theorists expanded and refined Schaeffer's ideas, situating Musique Concrète within broader cultural, technological, and aesthetic contexts. Palombini (1993) emphasizes the movement's dual identity as both an artistic and scientific endeavor, highlighting the role of emerging recording technologies in shaping new compositional possibilities. He argues that Musique Concrète reflects a historical convergence of artistic experimentation and technological innovation, wherein sound recording became not only a tool but also a compositional medium. This technological mediation transformed the studio into a creative laboratory, enabling processes such as looping, splicing, time-stretching, and spatialization.

Michel Chion further advanced the theoretical discourse by examining the audiovisual and perceptual dimensions of sound. In his analysis of electroacoustic and acousmatic music, Chion (1993) explores how sound detached from its visible source acquires narrative, symbolic, and affective power. His work underscores the psychological and semiotic potential of sonic material, reinforcing the idea that sound can function as an expressive and communicative medium beyond traditional musical syntax.

From an educational and aesthetic perspective, Eisner's contributions to arts-based cognition provide a broader interpretive lens for understanding Musique Concrète as a form of artistic inquiry. Eisner (2002) argues that artistic practices cultivate modes of thinking that extend beyond linguistic and logical reasoning, fostering perceptual sensitivity, imaginative exploration, and interpretive flexibility. Within this framework, Musique Concrète can be viewed not only as a historical compositional movement but also as a model for creative experimentation and experiential learning.

Collectively, the theoretical perspectives of electro-acoustic music composition reveal Musique Concrète as a multidimensional practice that intersects music, technology, perception, and cognition. Its emphasis on recorded sound, listening awareness, and sonic transformation continues to influence contemporary electroacoustic composition and pedagogical innovation, positioning it as a vital reference point for modern sound-based artistic and educational practices.

DIGITAL STORYTELLING AS A PEDAGOGICAL METHOD

Digital storytelling has emerged as a powerful pedagogical approach that integrates narrative, technology, and learner-centered instruction to foster meaningful and engaging educational experiences. At its core, digital storytelling involves the creation of short multimedia narratives that combine text, images, audio, music, and video to communicate ideas in a structured and expressive form. In educational contexts, this methodology extends traditional storytelling by incorporating digital tools that support creativity, reflection, and multimodal literacy.

Robin (2008) conceptualizes digital storytelling as a transformative instructional strategy that enhances students' ability to synthesize information, think critically, and communicate effectively. By engaging learners in the processes of story planning, scriptwriting, media production, and presentation, digital storytelling promotes higher-order cognitive skills and deep learning. This structured production cycle encourages students to construct knowledge actively rather than consume information passively, aligning with constructivist and experiential learning theories.

Sadik (2008) further emphasizes digital storytelling as a meaningful technology-integrated approach that strengthens student engagement and motivation. According to his findings, digital storytelling supports project-based learning by providing students with authentic creative tasks that require problem-solving, collaboration, and self-regulation. The process of designing and producing digital stories also enhances students' technological fluency, enabling them to develop both creative and technical competencies within a cohesive learning framework.

Within the digital storytelling model, pedagogy typically unfolds through interconnected stages: idea generation, narrative structuring, media collection, digital production, and sharing with an audience. Each phase supports metacognitive awareness, creativity, and communication, reinforcing the integration of artistic expression with academic learning objectives. Furthermore, the multimodal nature of digital storytelling accommodates diverse learning styles, enabling students to combine visual, auditory, and narrative modes to construct rich and personalized meaning.

In sum, digital storytelling represents a holistic educational methodology that unites narrative thinking, technological proficiency, and creative expression. Its capacity to cultivate engagement, critical reflection, and multimodal literacy makes it a highly effective model for contemporary education, particularly in disciplines that emphasize storytelling, digital *(media)* production, and artistic innovation.

LINKING MUSIQUE CONCRÈTE AND DIGITAL STORYTELLING

The conceptual and pedagogical linkage between Musique Concrète and Digital Storytelling arises from a shared emphasis on sound as an expressive, narrative, and meaning-making medium. Both practices challenge conventional hierarchies in artistic creation by privileging process, experimentation, and multimodal communication over fixed formal structures. While Musique Concrète redefines music composition through the manipulation of recorded sound, Digital Storytelling reimagines narrative construction through the integration of digital media. Their convergence provides a fertile framework for contemporary music education, particularly in contexts where creative composition remains underrepresented in formal curricula.

As a contemporary composer and educator, one is frequently confronted with a persistent gap in the structure of music education: the limited institutional presence of composition as a core subject in music school curricula. While instrumental performance, music theory, and musicological studies constitute the dominant components of formal training, systematic instruction in musical creation is often marginalized. This imbalance becomes particularly evident when considering pathways to tertiary music education, where composition is recognized as a foundational discipline alongside performance and musicology. The discrepancy raises a critical pedagogical question: to what extent does secondary music education cultivate the compositional competencies necessary for students to engage meaningfully with advanced studies in composition?

Linking Musique Concrète with Digital Storytelling offers a strategic response to this educational challenge. Musique Concrète provides students with accessible compositional tools that do not require advanced instrumental technique or traditional notation, allowing them to engage directly with sound as raw material. Digital Storytelling, in turn, offers a structured narrative framework through which sonic materials can be organized into coherent expressive forms. Together, these approaches enable learners to explore composition as both a technical and conceptual practice, fostering skills in critical listening, creative decision-making, and narrative thinking.

Within this integrative framework, sound functions not merely as musical texture but as a narrative agent capable of shaping atmosphere, guiding emotional interpretation, and structuring temporal progression. The act of composing thus becomes analogous to storytelling: selecting, transforming, and arranging sonic elements to construct meaning. This perspective aligns with contemporary discourse on electroacoustic creativity, which highlights the narrative and dramaturgical potential of ε-based composition (Rich, 2010).

Pedagogically, this linkage supports a shift from reproduction-based learning toward creative authorship. Students are encouraged to move beyond interpretative performance and engage in original compositional processes that integrate technological fluency, artistic exploration, and reflective practice. The establishment of a composition workshop within the Music Ensembles course exemplifies this approach, positioning composition not as an isolated specialization but as an essential dimension of musical literacy.

Ultimately, connecting Musique Concrète with Digital Storytelling addresses both an artistic and an educational imperative. It contributes to the enrichment of music curricula by embedding composition within collaborative, technology-enhanced learning environments, while simultaneously preparing students for the conceptual and technical demands of higher-level compositional study. Through this linkage, composition is reframed as an accessible, meaningful, and pedagogically vital practice within contemporary music education.

METHODOLOGY AND RESEARCH APPROACH

This study adopts a qualitative, arts-based research design to examine the pedagogical integration of Musique Concrète and Digital Storytelling in secondary music education. The methodological framework draws on three complementary strands: (a) literature analysis on Musique Concrète in secondary education, (b) autoethnography in artistic and music pedagogy, and (c) qualitative research into digital storytelling as a methodology oriented in the Arts.

First, the educational design of the composition workshop is informed by qualitative studies and literature analysis that investigate electroacoustic and sound-based composition in secondary school contexts. Research indicates that Musique Concrète offers an accessible entry point into composition by enabling students to work with recorded sound

rather than relying on advanced instrumental technique or traditional notation (Burnard, 2012). These studies emphasize the value of experiential learning, experimentation with sound materials, and student-led creative decision-making in developing contemporary musicianship. Similarly, O'Neill (2014) highlights how technology-mediated composition fosters creativity, agency, and critical listening in adolescent learners. Drawing on these insights, the present study structures learning activities around sound recording, editing, montage, and narrative-driven sonic composition.

Furthermore, the research employs autoethnography as a core methodological tool, positioning the teacher-researcher's lived experience as both a source of data and a mode of analysis. Autoethnography in arts and education enables systematic reflection on teaching practice, curriculum design, and artistic identity by integrating personal narrative with scholarly interpretation (Ellis et al.,2011). In music education specifically, autoethnographic approaches support inquiry into creative pedagogy, classroom interaction, and the affective dimensions of artistic learning (Chang, Ngunjiri, & Hernandez, 2016). Through reflective journaling, lesson-plan documentation, and ongoing critical self-analysis, the study examines how pedagogical choices evolve in response to student engagement, artistic outcomes, and institutional constraints.

Qualitative research on digital storytelling informs the integration of narrative and sound-based composition. Digital storytelling has been widely recognized as an effective educational methodology for fostering creativity, student voice, multimodal literacy, and reflective learning (Robin, 2008; Sadik, 2008). Within this framework, narrative structuring, media selection, and digital production are understood as meaning-making processes that parallel artistic composition. By embedding sound design within a storytelling model, the study situates electroacoustic composition as a narrative practice that supports both artistic expression and cognitive development.

Data collection includes reflective teaching logs, classroom observations, instructional materials, and qualitative analysis of students' electroacoustic compositions. These materials are analyzed thematically to identify patterns related to creative growth, narrative thinking, technological competence, and collaborative learning. Through triangulating educational literature, autoethnographic reflection, and digital storytelling research, the study seeks to generate a nuanced understanding of how Musique Concrète can function as both a compositional practice and a pedagogical strategy in secondary music education.

FINDINGS AND EDUCATIONAL IMPLICATIONS

The implementation of the composition workshop underscored the pedagogical significance of sound as an autonomous narrative medium within music education. The evaluation process aimed to examine the educational, aesthetic, technological, and reflective outcomes of the learning experience as they emerged in the authentic classroom setting. A dual analytical perspective—combining learner-centered observation with teacher-led reflective analysis—proved essential in capturing both the internal creative processes of students and the pedagogical dynamics shaping their engagement with Musique Concrète and digital storytelling.

Qualitative analysis indicated that working with Musique Concrète enhanced students' narrative abilities by encouraging them to conceptualize sound not merely as musical material, but as a vehicle for meaning, emotion, and storytelling. Through the processes of sound recording, editing, transformation, and montage, students learned to construct narrative structures using sonic events alone, without reliance on spoken language or visual imagery. This compositional approach fostered imaginative thinking and strengthened students' capacity to organize sound in ways that convey atmosphere, temporal flow, and expressive intent.

The workshop also contributed to the refinement of students' aesthetic sensitivity. Focused listening activities and sound manipulation exercises promoted heightened awareness of timbre, texture, spatiality, and sonic detail. As students evaluated their own and their peers' compositions, they developed critical listening skills and an increasingly nuanced understanding of sound as an artistic and communicative medium. The integration of digital storytelling principles further supported this process by encouraging learners to frame their compositions within coherent narrative trajectories, reinforcing creative decision-making and reflective interpretation.

From a technological standpoint, students demonstrated significant growth in digital competence. Hands-on engagement with digital audio tools facilitated the acquisition of practical skills in sound editing, layering, and processing, while simultaneously cultivating a broader perception of technology as a creative and expressive resource. The production and archiving of original electroacoustic compositions enabled students to build personal creative portfolios, strengthening their sense of artistic identity, authorship, and long-term creative development.

Although compositions were produced individually, collaboration emerged through structured peer reflection and collective discussion of compositional strategies, aesthetic choices, and narrative intentions. Students engaged in dialogic critique, shared listening sessions, and guided feedback activities, fostering a reflective learning environment in which ideas, techniques, and artistic perspectives were exchanged. This reflective collaboration supported metacognitive awareness, encouraged constructive self-assessment, and deepened students' understanding of the compositional process.

Overall, the findings suggest that Musique Concrète can serve as an effective bridge between music creation and digital storytelling, positioning sound at the center of a multimodal, narrative-driven learning experience. The workshop demonstrates that sound-based composition not only enhances musical creativity but also strengthens imagination, digital literacy, critical listening, and reflective artistic practice.

COMPARATIVE PERSPECTIVES

In order to contextualize the integration of Musique Concrète and Digital Storytelling, it is important to compare this approach with other educational practices. For example, project-based and inquiry-based learning share similar goals in fostering creativity and critical thinking. Arts-based research further emphasizes the importance of multimodality and experiential learning (Eisner, 2002; Bresler, 2007). In this light, Musique Concrète storytelling can be seen as part of a larger movement toward transdisciplinary pedagogy.

In order to contextualize the integration of Musique Concrète and Digital Storytelling within contemporary music education, it is useful to compare this approach with other interactive and arts-based pedagogical models that emphasize creativity, participation, and experiential learning. Across diverse educational frameworks, there is a growing shift away from transmissive teaching toward learner-centered methodologies that prioritize exploration, reflection, and creative authorship.

Project-based learning and inquiry-based learning share fundamental affinities with the present approach, particularly in their emphasis on student agency, problem-solving, and the construction of knowledge through sustained creative processes. Like Musique Concrète storytelling, these models encourage learners to develop original outputs through iterative experimentation, critical evaluation, and meaningful engagement with content. However, while project-based learning often prioritizes conceptual or interdisciplinary problem-solving, sound-based narrative composition uniquely foregrounds listening, sonic imagination, and aesthetic decision-making as primary cognitive and expressive skills.

Similarly, participatory and improvisational pedagogies—such as creative music-making, live composition, and interactive performance practices—promote responsiveness, collaboration, and embodied musical understanding. These approaches foster real-time creative thinking and collective meaning-making, whereas Musique Concrète composition situates creativity within a studio-based, reflective, and technologically mediated environment. This distinction enables deeper engagement with sound manipulation, temporal structuring, and post-production processes, expanding students' awareness of composition beyond performance-centered paradigms.

Arts-based education and arts-based research further provide a relevant comparative framework, emphasizing multimodality, experiential inquiry, and the cultivation of aesthetic cognition. From this perspective, Musique Concrète and Digital Storytelling align with broader pedagogical movements that recognize artistic creation as a form of knowledge production. By integrating sound, narrative, and digital media, this approach supports transdisciplinary learning, bridging music, media studies, storytelling, and technological literacy within a cohesive educational model.

Compared with visual-centered digital storytelling practices, the sound-oriented focus of Musique Concrète offers a distinctive contribution by positioning auditory perception as the primary narrative driver. This shift challenges dominant visual hierarchies in media education and promotes the development of deep listening, sonic awareness, and auditory imagination. Moreover, it enables students to engage with narrative meaning in non-verbal, abstract, and emotionally nuanced ways.

In this broader comparative context, Musique Concrète storytelling can be understood as part of an evolving educational movement toward interactive, transdisciplinary, and artistically grounded pedagogy. Its integration within music education complements and extends existing creative learning models by foregrounding sound as both a compositional material and a narrative medium, thereby enriching the landscape of contemporary arts-based educational practice.

IMPLICATIONS FOR TEACHER TRAINING

The integration of Musique Concrète in Digital Storytelling also raises questions about teacher preparation. Educators must acquire technical skills with audio software and cultivate openness to experimental methods. Teacher training programs could integrate workshops on sound-based composition, collaborative design, and digital media literacy. The TPACK framework (Mishra & Koehler, 2006) provides a strong model for preparing educators to integrate technology, pedagogy, and content knowledge effectively.

As digital storytelling increasingly gains recognition as a tool for artistic expression and narrative construction, music educators must be equipped with both the conceptual and practical skills necessary to guide students through sound-based creative processes (Robin, 2008; Sadik, 2008). Teacher training programs should emphasize the pedagogical value of digital storytelling as a compositional framework that supports creativity, student voice, and multimodal learning. By engaging future educators in narrative-based sound composition, teacher preparation can foster a deeper understanding of how sound, structure, and meaning intersect within digital media environments. This aligns with research highlighting the role of storytelling in promoting reflective learning, critical thinking, and learner-centered instruction (Hull & Katz, 2006; Ohler, 2013).

Furthermore, professional development should include hands-on training in digital audio tools and sound editing platforms, enabling teachers to confidently implement electroacoustic composition activities in classroom settings. Familiarity with digital audio workstations, sound manipulation techniques, and media archiving platforms enhances teachers' capacity to support students in producing original creative work while simultaneously strengthening their own digital literacy (Burnard, 2012; Savage, 2005). Such training positions technology not merely as a technical resource, but as an expressive and pedagogical medium.

Equally important is the cultivation of reflective and arts-based teaching practices. Educators must be prepared to facilitate critical listening, aesthetic evaluation, and narrative interpretation within sound-centered learning environments. Training in arts-based and practice-led research approaches can support teachers in documenting classroom processes, interpreting creative outcomes, and continuously refining their instructional strategies (Barrett & Stauffer, 2009; Eisner, 2002). This reflective orientation encourages teachers to view composition not only as a curricular topic but as an evolving artistic inquiry.

In addition, digital storytelling in composition invites a shift from performance-dominated music education toward more inclusive models that value creation, experimentation, and authorship. Teacher education programs should therefore promote pedagogical frameworks that legitimize composition as a core musical competency, empowering educators to integrate creative sound work into ensemble courses and general music curricula.

Overall, preparing teachers to employ digital storytelling as a compositional tool requires an interdisciplinary training model that combines music pedagogy, media literacy, creative technology, and reflective practice. Such preparation equips educators to support innovative sound-based learning experiences that enhance creativity, narrative thinking, and contemporary musical expression.

LIMITATIONS AND FUTURE RESEARCH

While the present study demonstrates the pedagogical value of integrating Musique Concrète and Digital Storytelling in music education, several limitations should be acknowledged. First, the research is situated within a specific educational and cultural context, which may limit the generalizability of the findings to other institutional settings, age groups, or curricular frameworks. The workshop was implemented within a particular course structure, and its outcomes may vary if applied in different school systems, technological environments, or levels of musical expertise.

A further limitation concerns the qualitative and practice-based nature of the research design. Although in-depth reflective analysis provides rich insights into students' creative and narrative development, it does not allow for large-scale statistical validation or direct comparison with control groups using alternative pedagogical methods. Additionally, the reliance on the teacher-researcher's autoethnographic perspective introduces an interpretive dimension that, while valuable for reflective inquiry, may be influenced by subjectivity and personal artistic priorities.

Technological constraints also represent a potential limitation. Access to digital audio tools, recording equipment, and software proficiency can affect both the quality of student output and the feasibility of replicating the workshop in less technologically equipped educational environments. Variations in students' prior digital literacy may further shape learning outcomes, creating uneven levels of engagement or technical confidence.

Future research could expand this study in multiple directions. One promising avenue involves the application of sonification in the natural and positive sciences, where data is transformed into sound to support scientific interpretation, pattern recognition, and conceptual understanding. Investigating how Musique Concrète techniques might intersect with sonification could open interdisciplinary pathways linking artistic sound design with scientific data representation, enhancing both creative expression and STEM learning.

Moreover, the integration of immersive technologies such as virtual reality (VR) and augmented reality (AR) could significantly expand the expressive and pedagogical possibilities of Musique Concrète storytelling. Immersive environments could enable students to experience spatialized soundscapes, interact with sonic narratives in three-dimensional virtual spaces, and construct multisensory narrative worlds that deepen engagement and embodiment. Such developments may transform sound-based storytelling into a fully immersive compositional and narrative practice (Bacca et al., 2014; Parong & Mayer, 2018).

Additional future research could explore longitudinal impacts on students' creative identity, compositional skill development, and career pathways, as well as comparative studies examining Musique Concrète storytelling alongside other creative pedagogies. Expanding the scope to include cross-cultural, interdisciplinary, and technology-enhanced contexts would further contribute to understanding the evolving role of sound-based composition in contemporary education.

CONCLUSIONS

This study demonstrates that the integration of Musique Concrète within the framework of Digital Storytelling constitutes a viable and pedagogically meaningful approach to contemporary music education. By repositioning sound as both a compositional material and a narrative medium, the proposed workshop expands traditional music pedagogy beyond performance and notation, emphasizing creativity, listening awareness, and artistic authorship.

The findings indicate that engaging students in electroacoustic composition fosters the development of narrative thinking, aesthetic sensitivity, and critical listening skills. Through processes of sound recording, transformation, and montage, learners acquire the ability to structure meaning and emotion through sonic events, reinforcing the expressive potential of sound independent of verbal or visual media. At the same time, the integration of digital storytelling principles supports reflective learning, imaginative exploration, and coherent narrative construction within sound-based compositions.

Beyond artistic outcomes, the project highlights the educational value of composition as a core musical competency. By incorporating Musique Concrète into the Music Ensembles curriculum, the study addresses a longstanding gap in formal music education regarding systematic training in creative music-making. The workshop model demonstrates that composition can be taught in accessible, technology-supported, and pedagogically structured ways that benefit students with diverse musical backgrounds and technical abilities.

Furthermore, the research underscores the importance of digital literacy in modern music education. Students' engagement with digital audio tools enhances technological competence while promoting an understanding of technology as an expressive and creative partner in artistic production. The formation of personal creative portfolios further strengthens learners' sense of artistic identity, ownership, and long-term creative development.

In conclusion, linking Musique Concrète with Digital Storytelling offers a compelling framework for reimagining music education as a space of experimentation, narrative exploration, and creative inquiry. The approach not only enriches compositional pedagogy but also contributes to broader educational goals, including imagination, critical reflection, and interdisciplinary learning. As music education continues to evolve in response to technological and cultural change, sound-based storytelling emerges as a powerful model for fostering innovative, inclusive, and future-oriented artistic learning.

RECONNECTING STUDENTS: ENSURING EMOTIONAL GROWTH IN A DIGITALLY DRIVEN EDUCATIONAL SYSTEM

Maria Kardama
English Language and Literature Teacher
1st Vocational School of Kato Achaia
Patra, Greece.
Email: mkardama@gmail.com

ABSTRACT

In today's educational setting, students who are largely dependent on media technologies for learning and communication may tend to prefer computer-mediated communication over face-to-face interaction. While digital technologies have numerous advantages, such transformation can hinder the development of some core social skills such as friendship making, teamwork and dealing with actual life, social issues that require emotional maturity and empathy. This presentation explores the potential long-term effects of excessive dependence on digital technology on the ability of students to engage in personal, interpersonal communication. We will look at the dilemma teachers facing in juggling digital learning with opportunities for students to gain essential soft skills in class. We will also discuss ways of integrating both digital and face-to-face interactions to produce balanced students who have the emotional intelligence needed to cope with complex social situations. Based on case studies, research, and real-life scenarios, valuable input will be given on how to encourage a balanced approach toward digital media in education so that students achieve good results academically as well as develop socially and emotionally.

Montessori School and Limited Screen Time, Flipped Classroom with In-Person Discussion, Tech-Free Study Hours, Online and Offline Reading Mix, Mindful Break Zones, Digital Detox Challenges are but a few modern pedagogical approaches that integrate technology while prioritizing human interaction to equip students with both technical knowledge and the interpersonal skills needed for success in their future career and personal life. By consistently recognizing and validating feelings and logical thinking, students are supported to build confidence, creativity and resilience, leading to a more supportive and participative classroom than the digitally based one. “Education must begin with the solution of the teacher-student contradiction, by reconciling the poles of the contradiction so that both are simultaneously teachers and students”, Paulo Freire highlights. This very much fosters interactive learning in which technology should serve to augment, not replace human contact and soft skill building. Even if technology can replicate real scenarios, communication, teamwork, empathy, and leadership develop best out of human interaction. Global competency goes far beyond language fluency. Good Emotional Intelligence (EI) is accumulated through real dialogues, clashes, and listening, which cannot be provided by a single technology tool. Teaching and learning require social concession, bargaining, and joint decision-making, which work best in real environments. Literally, technology needs to support—but not replace—the human connections that make learning really exciting and meaningful.

Key words: emotional intelligence, real life scenarios, human interaction, soft skills, balanced teaching approach

INTRODUCTION

The modern digitalized educational system, with artificial intelligence (AI) reshaping education in many key ways, has rapidly transformed from a futuristic concept to a common reality. In 2025, AI technologies revolutionize the education world to present surprising opportunities for productive learning at the individual level, administrative efficiency, and improved educational performance (Luckin et al., 2016; Holmes et al., 2019). From intelligent tutoring lesson plans of early years to AI-based orchestration of classrooms, digital age influence on education goes really deep and seems far-reaching.

AI is breaking down the walls of traditional schooling, unveiling a world in which learning flows seamlessly, at the unique pace of every individual. With materials that accommodate a range of learning styles and abilities, information no longer exists within strict parameters, reaching each learner at their point of need, creating an environment in which all learners can thrive (Selwyn, 2019; Williamson & Eynon, 2020).

Evidently, all educators somehow interrelated to the learning process have been more or less familiar with several digital media such as interactive whiteboards, learning applications, e-books, e-learning platforms such as Coursera, Khan Academy, and Moodle for interesting and affordable learning opportunities, videos and podcasts to facilitate visual and auditory learning, virtual and augmented reality (VR/AR) in subjects such as science and history, gamification tools such as Kahoot! and Duolingo to grab students' attention, online collaboration platforms such as Google Classroom, Microsoft Teams, and Zoom to simplify communication and collaboration among teachers and students or students in different countries, chatbots, 3D printing to bring STEM concepts into reality through tangible models, and online test tools such as Quizzes and Socrative for instant feedback to make the process of learning more entertaining and efficient (Redecker, 2017; Luckin et al., 2016; Dillenbourg et al., 2021).

We will not elaborate on the profound positive influence of the aforementioned means of learning, as it is self-evident that fostering practical application of them yields enduring benefits deeply appreciated in everyday schooling. This article explores the possible or expected long-term effects of excessive digital dependence on students' ability to engage in personal and interpersonal communication. We will discuss the challenges that educators face in balancing digital learning with opportunities for students to develop essential soft skills (Greenhow & Lewin, 2016; OECD, 2021). Mainly, we will present strategies for integrating both digital and personal interactions to nurture well-rounded students who are equipped with the emotional intelligence needed to navigate complex social dynamics (Goleman, 1995; Mayer et al., 2008). Through case studies and practical examples, the article will provide some insights into how to encourage a balanced approach to digital media in education, ensuring that students not only excel academically but also grow emotionally and socially.

THE DOUBLE-EDGED SWORD OF TECHNOLOGICAL INTEGRATION

As nothing is ever a coin with only one side, always having both merits and flaws, the digital transformation of education faces several challenges nowadays. In a nutshell, over-reliance on technology can lead to students' becoming fully-dependent on devices, diminishing or zeroing their critical thinking, creativity, and attention span. Furthermore, the rise of online learning can reduce social interactions, halt communication skills, and isolate students from essential face-to-face collaboration. The lack of regulation in digital platforms may lead to unreliable sources, and the absence of standardized quality control to inconsistent learning input. Moreover, prolonged screen time can harm students' physical health, namely eye strain or backache and poor posture, giving on to a total avoidance of physical activity. Digital tools may also promote shallow learning, reducing deep engagement with the new content of the academic modules. Multitasking and simultaneous use of social media hinders focused study time while if a classroom environment allows both teachers and students to be busy working on their digital tools during the learning period, then they will never learn themselves in depth and personal needs will never be addressed or diagnosed. Finally, not all educators are equally equipped to integrate technology effectively, which means chaotic learning conditions and loss of discipline that will dominate the classroom landscape.

At this precise moment, it is imperative that we pause, take a deep breath, and embark on a self-inquiry status about the balance between AI and EI in education and the possibility of re-directing students back to a less digitalized educational system. Do online interactions (e.g., chats, emails, online discussions) promote students' development of empathy, or do they create emotional detachment? Can students successfully perceive and express emotions in an online learning environment? Do online tools support mindfulness and emotional self-regulation, or do they promote impulsive behavior (e.g., instant responses, no reflection at all)? What effects does less in-person interaction have on students' comprehension of tone, facial expressions, and body language? Are students learning how to navigate conflicts

constructively in digital spaces, or does online communication increase misunderstandings and cyberbullying? Are we responsible for the dehumanization of our students' learning because of the excessive use of technology-driven education that prioritizes digital efficiency over emotional growth?

John Dewey underlines that “Education is not preparation for life; education is life itself.” emphasizing the need for holistic education, blending digital tools with real-life skills development. Pedagogists and school psychologists are alarmingly noticing that the modern student is constantly plugged in but unfortunately feeling disconnected. The digital world offers multi-folded, on the spot connection, but it also brings isolation, stress, and emotional exhaustion. Looking for their personal identity between social media pressures, online learning, and the constant bombardment of notifications, students often struggle to find real, deep connections and authentic conditions to formulate their own self icon .The dopamine from social media has already replaced the excitement for meaningful everyday relationships, and the pressure to always be “on” can be draining. The modern student, unarmed with the essential toolkit of soft skills, becomes a highly knowledgeable but socially and emotionally struggling individual.

If we wish to outline the modern student’s profile, we can effortlessly conclude that social media, online classes, and digital entertainment create an illusion of connectivity leading to vast loneliness. Many students struggle to express emotions beyond emojis and text messages, making relationships unstable, weak and impersonal. The unceasing effort to present and maintain a "perfect" online persona generates stress and anxiety, leading to emotional burnout. This inability to manage stress effectively affects their daily academic performance, personal growth, self-esteem development and, thus, future career prospects and decisions. Moreover, the instant problem solving possibilities provided by technology (quick Google searches, AI assistance, and automated solutions) reduces critical thinking and problem-solving skills. When facing real-world challenges, such as classroom conflicts, job interviews, workplace demanding situations, students often feel helpless or frustrated because they have not developed resilience. Without the ability to adapt to new environments, students may struggle in a difficult school condition or a workplace simulation that require quick decision-making and flexibility. Many students who lack handling mechanisms based on soft skills, resort to escaping reality harming their physical or psychological balance.

One of the most crucial soft skills is empathy, a word that is overused nowadays but not practically applied in the real school culture. What is empathy? Empathy is the ability to understand and share the feelings of others, to put yourself on other people’s shoes and try to walk with them .Unfortunately, in today’s digital-driven world, many students are struggling with a decline in empathy building up several social misunderstandings and finally losing trust to others and themselves. Empathy requires viewing things from another person's point of view, but a digital world is mostly self-centered. The fast-paced nature of the internet prioritizes immediate reactions over thoughtful responses permitting students to become unable to consider opposing perspectives. It is common that some students prefer to stay in echo chambers, interacting only with like-minded individuals, so as not to be stressed out about how to understand diverse experiences.

Without doubt, one of the collateral but still prevailing effect of the digital explosion in education is the desensitization of the young generation. Constant exposure to online conflicts, cyberbullying, and negative news makes students less sensitive to real-life suffering while the constant bombardment of information and online drama can make them emotionally numb. Real-life conversations require active, sympathetic listening and emotional presence, which digital interactions do not always encourage while the easiness in scrolling past distressing input without even realizing the seriousness of it, reduces emotional engagement with real-world problems that synthesize the current social status.

I definitely remember with some regret the story of one my students. A high school student, Panos, spent most of his school days retrieved in a remote school spot doing his assignments on his laptop while his communication with other adolescents outside school was only through social media platforms. He rarely interacted with his classmates in person. When he finally met someone he liked at a social event, he struggled with basic flirting and body language cues, making real-life romantic interactions awkward. Since much of his communication had been through screens, he found it difficult to read facial expressions or engage in meaningful face-to-face conversations with a result to sound anti-social and be rejected by the person he was interested in.

We are, therefore, inclined to believe that the tools that enhance or jet out the learning dynamics—these very same tools can, paradoxically, create barriers to personal development. As students become increasingly immersed in the screen-based lessons of an algorithm-driven curriculum, opportunities for organic conversation, teamwork, and interpersonal problem-solving are disappearing (Greenfield, 2015; Turkle, 2017). The enriched, unpredictable synthesis of face-to-face interactions led by a spontaneous exchange of ideas and illustrated by the bright signs of body language cannot be fully replicated by digital means (Sälzer & Prenzel, 2020).

In the current middle-school classroom with Gen Alpha students (Generation Alpha includes those born between 2010 and 2025, raised in the era of smartphones and AI), educators stand at the crossroads of innovation and tradition, tasked with weaving together the vast potential of digital learning with the enduring necessity of reconnecting them with human connection (McCrindle & Fell, 2021; Livingstone & Blum-Ross, 2020). Amidst this digital transformation, a fundamental challenge has emerged: How should teachers nurture the essential soft skills that define human interaction—communication, collaboration, problem-solving, and emotional intelligence (World Economic Forum, 2020)?

True learning lies farther and beyond sheer comprehension of facts; it is shaped by dialogue or even debate, moments of struggle and triumph shared with peers, the ability to read somebody's emotions and respond with empathy (Goleman, 1995; Mayer et al., 2008). In a world increasingly directed by technology, teachers should set the goal to ensure that the human elements of education will not get exfiltrated in the pursuit of efficiency (Selwyn, 2019). They must invent ways to integrate technology without allowing it to overshadow the fundamental need for individual growth, fostering an environment where both digital fluency and social intelligence thrive in harmony (Holmes et al., 2019). As we all realize, the challenge is not only to counterbalance digital learning with soft skills development, but to design a clear interplay between the two. The aim is the construction of a classroom culture where technology serves as a bridge rather than a barrier or an end in itself, where students accumulate knowledge but also manage to articulate their thoughts and feelings, becoming more adept at navigating the complexities of several aspects of human relationships. Only then can education fulfill its highest humanitarian purpose: to prepare young minds not just for a world of information, but a humane world of free-thinking, self-existent personalities (Nussbaum, 2010).

Maria Montessori advocates that "The greatest sign of success for a teacher is to be able to say, 'the children are now working as if I did not exist'', highlighting the importance of the learning atmosphere of independence, collaboration, and problem-solving far beyond the use of digital tools. There are some educational systems, institutions or methodologies that have already adopted a more balanced digital teaching approach with numerous positively encouraging effects on students learning achievements.

GLOBAL MODELS FOR BALANCED EDUCATION

Finland's Digital Learning Model: Digital tools like AI, VR, and gamification are integrated into teaching, with online platforms supporting remote and hybrid learning for students with special educational needs while teachers have flexibility in choosing digital resources and receiving continuous professional development in digital pedagogy. On the other hand, the curriculum encourages outdoor learning and hands-on projects based on interdisciplinary units or thematic modules, promoting creativity, teamwork, communication, and critical thinking. There is a strong focus on cybersecurity and responsible digital citizenship as a core subject, ensuring that students develop critical media literacy and ethical use of technology.

Montessori Schools and Limited Screen Time: A great deal of Montessori schools focus on hands-on learning where students are engaged in actual work. For example, instead of just learning chemical reactions, students mix vinegar and baking soda and see the reaction themselves. Similarly, medical students practice operations on mannequins, coding students build actual apps, and business students practice negotiations. Thus, learning is made more experiential, interactive, and effective. Additionally, age-based and progressive inclusion of digital media is compulsory limiting screen utilization by younger pupils. Instead of relying extensively on tablets, they advocate interactive cooperative work, kinesthetic manipulatives, and true problem-solving within the natural environment.

Singapore's Holistic Digital Learning Approach: Singapore has integrated digital learning into its curriculum while emphasizing mental health and digital literacy. Schools feature "cyber wellness" curricula that instruct pupils on responsible internet use, screen time management, and online manners. Educators receive special training in order to integrate cyber wellness topics into coursework. Schools make use of learning platforms like Student Learning Space (SLS) which have digital literacy modules and AI-powered tools that help track students' screen time and online behavior in a non-intrusive way. Finally, the Ministry of education collaborates with technology companies to make online learning spaces safer while laws against cyberbullying, doxing, and online harassment are strictly enforced.

Flipped Classroom Model: A blended method with digital media for self-instruction and interaction in class minimizes student workload and increases interaction. Students learn home lectures in an online class and engage using participative discourse or work on hands-on lab projects during lectures. The process allows students to learn on their own while they have free class time to engage actively. In a high school math class for example, the students watch a pre-recorded video on algebra concepts in their homes. They can pause, rewind, and replay the videos at their convenience,

which allows them to learn at their own pace. When they come to class the next day, instead of listening to a lecture, they do group problem-solving exercises, discuss tough questions, and receive immediate guidance from the teacher. Such interactive session helps consolidate their knowledge and allows the instructor to address problems on an individual basis.

PRACTICAL STRATEGIES FOR EDUCATORS

Nevertheless, for those of us who need to work within ordinary school systems, it is crucial to implement specific strategies to balance digital learning with emotional growth. We should always recognize the fact that global competency goes beyond language fluency. Let us see some of these strategies to enrich our toolkit:

Mix of Digital and Real-World Activities: Students conduct a research on a topic (e.g environmental issues) and then they organize fieldwork or they interview experts to test their prototype research paper. They write a blog, or present their findings creatively in posters, live presentations, or digital reports. This way, they meet the criteria for using both digital tools for research and accomplishing real-world engagement, teamwork, and public speaking.

Online and Offline Reading Mix: A reading program that combines e-books with physical books, encouraging students to experience different formats working continuously on formulating digital and traditional reading habits, allowing students to discover what works best for them.

Tech-Free Study Hours: Some school libraries define tech-free study zones.

Tech-Free Story Telling: Students read e-books, for example fairy tales or traditional myths, and then they have to narrate the story and have a class discussion about the literary aspects or the moral of the story.

Drawing Instead of Watching: The teacher may replace screen-based activities with creative art presentations on wall papers to analyze the topic of the lesson or the lesson outcomes.

Outdoor Exploration Lesson: The whole class spend a period outside engaging in hands-on learning, for example if the topic is about plant growth, growing vegetables in a school garden may follow online reading about photosynthesis.

Screen Time Reflection Exercises: Students are required to track their screen time for a specific period of time and analyze its impact on their sleep, mood, and school performance or general effectiveness. They, then, set personal goals to optimize their tech use in an effort to promote self-regulation and responsible digital habits.

Digital Collaboration with In-Person Debriefing: Students work on a shared Google Doc for a group project but afterwards they meet in person to discuss roles, brainstorm ideas, and refine their final presentation which in practice fully encourages digital literacy and interpersonal skills at the same time.

Power point Presentations with Peer Feedback: Students present their work using digital tools and the evaluation comes in a rubric designed by the students themselves and is explained orally as peer constructive feedback which entails verbal communication, critical thinking and emotional intelligence.

Realia and Class Discussions or Debates: The students are asked to use real world media to collect authentic dialogues, case studies or articles to create the thematic opinions to lead discussions or debates.

Family Digital Detox Challenge: Teachers assign students a challenge to do at home with their families so that the effort is continued at home and the wider school community is energized.

CONCLUSION

The present study highlighted the harmonious coexistence of Artificial Intelligence (AI) and Emotional Intelligence (EI) as a cornerstone for the transformation of secondary education. While AI offers unprecedented opportunities for personalized learning and administrative efficiency, the study emphasized the critical need for the simultaneous cultivation of EI to ensure a holistic and human-centered educational process. The interaction between EI skills and AI-based learning environments was explored. The findings are expected to demonstrate how EI influences students' willingness and ability to engage with these systems, leading to optimized learning outcomes.

Furthermore, the study examined the reciprocal influence between EI and AI algorithms, aiming to integrate emotional awareness into educational tools, thereby enhancing adaptability and personalization.

The study also shed light on potential risks arising from the lack of interaction of these two domains. It recognized the possibility of emotional detachment and decreased empathy in an overly digitized environment, underlining the need for strategies to counterbalance the impersonal nature of technology.

Specific strategies were proposed to balance digital learning with emotional development, including a blend of digital and real-world activities, screen-free study hours, non-digital storytelling, artistic expression, outdoor exploratory lessons, and screen-time reflection exercises.

Examples from educational systems such as the Finnish model, Montessori schools, Singapore's approach, and the Flipped Classroom Model were presented as exemplary practices for the successful integration of technology with the development of soft skills.

In our over-automatized world where screens often replace face-to-face connection, the heart of education must remain human. Reconnecting students emotionally is not a luxury—it's a great necessity. As we embrace the power of digital innovation, let us also champion compassion, empathy, and emotional growth. When students feel seen, heard, and valued, they don't just learn better—they live better. By weaving emotional well-being into the fabric of our digital classrooms, we can nurture not only smarter minds, but kinder hearts and stronger spirits. Always keep in mind that the future of education is not to be just digital—it's deeply human.

Kriketou Theodora
MEd Greek Language teacher, Secondary Education Teacher
Secondary Education of Achaia, Greece
e-mail: theodora.kriketou@gmail.com

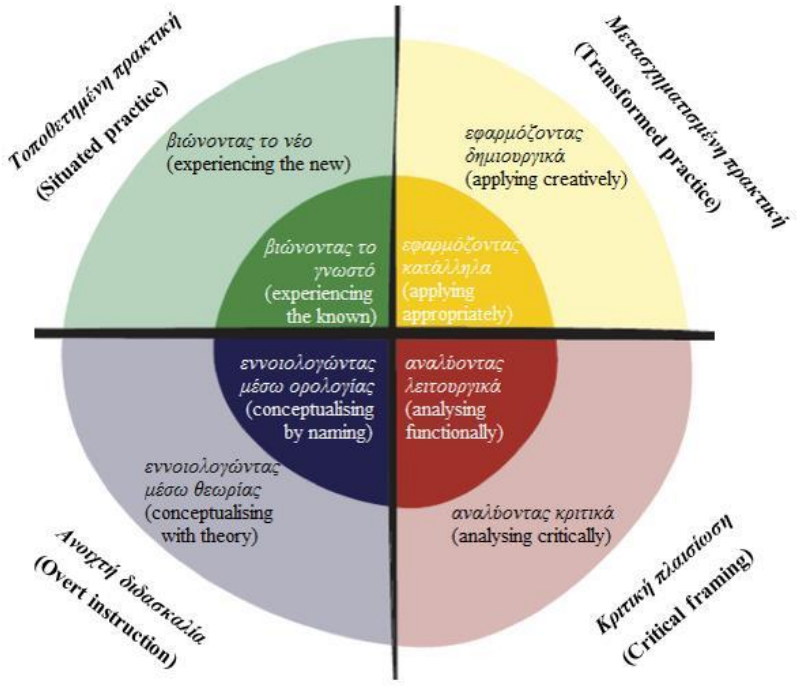
ABSTRACT

The present article discusses issues that occupy an important place in the new Curricula and concerns, on one hand, the formulation of an alternative proposal for the teaching of storytelling, through the utilization of multiliteracies and creative writing, and, on the other hand, the investigation of the results that emerged from the implementation of this proposal. The teaching plan was designed and implemented for the purposes of Modern Greek Language course by the Greek Language teacher and Laboratory Teaching Staff of the Department of Educational Sciences and Social Work at the University of Patras, Ms. Effrosyni Kostara, and the Greek Language teacher at a High School, Ms. Theodora Kriketou and was applied during the 2024-2025 school year in the context of a model teaching session to first-year high school students in an urban school of Patras. After the completion of the teaching session, both the students and the teachers who attended the lesson were provided with questionnaires in order for the researchers to ascertain a) the effectiveness from the use of multiliteracies and creative writing in the teaching of storytelling and b) the contribution of multimodal texts to the development of creative writing skills.

Initially, the article presents the key aspects of multiliteracies theory and the contribution of creative writing in the development of students' linguistic and communicative skills, as well as to the enhancement of their creativity. Then, the implemented teaching scenario is outlined, the main goal of which is for students to discover and understand the macrostructure of narrative through the use of a multimodal text (video) and the collaborative production of their own narrative text in a specific communicative framework. The teaching approach includes activities for decoding semiotic modes of multimodal texts and creative writing, aiming to develop students' visual and critical literacy, as well as to cultivate collaborative storytelling skills. The methodology leverages collaborative group teaching and inquiry-based learning with the application of dialogic discussion techniques in plenary and student groups.

Finally, the article discusses the findings of the questionnaires distributed to students and teachers which are structured around three main axes. The first axis concerns the application of multiliteracies, the second focuses on the utilization of creative writing and the third is anchored on the results of the transition from the processing of multimodal text to creative writing. Based on the findings, the students understood the structure of narrative through the use of non-written text (video) and became familiar with other semiotic modes (such as images and sound) that can not only convey messages but also to present the development of a story. Furthermore, collaborative text production in groups helped students generate more ideas and express emotions more freely. Finally, it was observed that the multimodal elements of the video helped in the creation of their own stories, as the use of images contributed in shaping the style and atmosphere, while music and sound effects inspired ideas for the emotional development of the characters in the story.

Keywords: multiliteracies, multimodal texts, creative writing, creative storytelling.



INTRODUCTION

UTILIZATION OF MULTILITERACIES IN LANGUAGE TEACHING

The contemporary educational reality is characterized by the rapid development of technologies and the increasing multimodality of texts circulated in everyday life. Students come into contact with multimodal texts, such as digital stories, interactive presentations and multimedia narratives, which helps them understand that meaning is not conveyed exclusively through written or oral language, but also through combinations of visual and auditory elements (Kalantzis & Cope, 2020). For this reason, the concept of multiliteracies, as formulated by the New London Group (1996), emphasizes the need for a broadened literacy that will include not only the understanding and production of written language, but also the cultivation of skills for understanding and producing meanings through a range of semiotic modes, such as image, sound and movement.

The utilization of multiliteracies in teaching is associated with the "functional use of language", that is, the processing of texts and the production of speech in authentic communicative contexts, with the aim of effective communication in various communicative conditions (Charalambopoulos & Chatzisavvidis, 1997). In this context, speech production in the theory of multiliteracies constitutes a dynamic process, which concerns not only the final product, but all the stages from the selection of material from a set of available resources (designed), the combination of elements and its composition (designing) to the new produced product (redesigned) (Cope & Kalantzis, 2000; Chatzisavvidis, 2013). This process is realized during teaching through four phases (Figure 1), that overlap with each other, without a linear sequence: a) situated practice, which concerns the utilization of students' experiences and their initial contact with types of "authentic" texts they encounter in everyday life, with the aim of provoking their interest, b) overt instruction, i.e., the process of presentation by the teacher and reception by the students of the new knowledge through collaborative group activities, c) critical framing, which concerns the critical consideration and interpretation of elements, through associations, comparisons, questions and d) transformed practice, which concerns the formation of a new text in a specific communicative context (Kalantzis & Cope, 1999; Chatzisavvidis, 2013).

Figure 1
Diagrammatic representation of the multiliteracies model

Source: Kalantzis & Cope, 1999

In the Greek educational reality, the integration of multiliteracies is a central axis of the modern Curricula, as they promote creativity, critical thinking and collaborative learning. Through their utilization, students develop digital literacy skills, improve their communicative competence and gain a deeper understanding of the types of texts they encounter (Kapsalis, 2021). In addition, the use of multimodal texts in teaching enhances differentiated learning, allowing students with different learning profiles to actively participate in the process (Karavaku, 2022). Besides, multiliteracies

are directly related to Gardner's theory of multiple intelligences (1999). Kostara (2024) specifically points out the importance of their utilization as a methodological tool for teaching Roma students, while Fterniati (2010) emphasizes the importance of the pedagogy of literacy and multiliteracies in the language course at primary school, stressing that the utilization of multimodal texts can enhance students' critical thinking and creativity, while, at the same time, enhances participation, providing opportunities for everyone, regardless of linguistic or cultural background, to express themselves and participate actively in the learning process (Serafini, 2014).

UTILIZATION OF CREATIVE WRITING/NARRATIVE IN LANGUAGE TEACHING

Creative Writing refers to the art of writing texts with imagination and creativity as primary elements. It gives children the opportunity to come into contact with the art of writing, while at the same time it entertains and educates, helping to relieve anxiety and enjoy the process (Vakali & Kotopoulos, 2023). It concerns the process of creating a new text, in which the writer's thoughts, reflections or memories are rendered in an attractive way, incorporating their ideas and feelings and organizing the events in a cohesive manner (Papantonakis & Kotopoulos, 2011). As evidenced by many research studies, Creative Writing provides the opportunity for artistic expression to students, familiarization with the rhythm and harmony of speech, with ways and techniques of literary writing, contributing to the development of multiple intelligence (Gunduz & Ozcan, 2016) and serving experiential - discovery learning in a student-centered teaching environment (Kotopoulos, 2012). For this reason, its entry into the Curricula of our country has been promoted (Vassiliou, 2016), while it now holds an important place in the new Curricula https://iep.edu.gr/el/nea-ps-provoli).

Storytelling in education is used for pedagogical purposes, entertainment, but also for the transmission and preservation of cultural elements (Iliopoulou, 2021), creating a safe framework for raising awareness on various issues. It constitutes an effective pedagogical method, which contributes to the empowerment of self-perception and identity (Hibbin, 2016; Gupta & Jha 2022), to the enhancement of memory (Schank, 1999), to the development of cultural sensitivity and to the cultivation of emotional intelligence (Mello, 2001). It enhances students' skills in understanding and producing speech (Maddumage, 2023), oral, written or multimodal, especially with the utilization of multiliteracies and new technologies (multimedia, sound, graphics, video). In particular, the narration of stories or fairy tales is a tool that can contribute to the highlighting of children's thoughts and the identification of their difficulties, helping them to understand their world more accurately (Miller & Pennycuff, 2008; Sakellariou, 2024). Finally, utilizing the power of story as fiction, Creative Narration and Writing helps in the externalization and communication of experiences and feelings, developing a spirit of cooperation among the participants, when it is done collaboratively (collaborative speech production).

GENERAL FRAMEWORK OF THE TEACHING PROPOSAL

The present teaching proposal was implemented in the 3rd teaching unit of the Modern Greek Language course at the 1st grade of Junior High School, as part of a model teaching, which was attended by teachers of an urban Junior High School of Patras, during the school year 2024-2025. The main objective of the design of this particular teaching is, on the one hand, for the students to practice collaboratively and exploratively in understanding the superstructure of narrative, through an audiovisual medium (video), and on the other hand, to apply in practice the theory concerning the text type of narrative, through writing their own narrative story and their involvement in creative writing activities.

In particular, the teaching proposal is organized in three phases. The first phase takes place in the classroom and lasts one (1) teaching hour. In this phase, students are taught, through the utilization of a multimodal text, the basic points of the superstructure of narrative followed by reflections and dialogic discussion. The second phase takes place during the second teaching hour and in this phase each group is asked to produce collaboratively, based on the superstructure of narrative they worked on during the first teaching hour, their own narrative story. In the third phase, which constitutes the evaluation of the model teaching, questionnaires are designed both for the students participating in the model teaching and for the observing teachers, in order to collect their views from their involvement in this experience and to evaluate the results of the utilization of multiliteracies and creative writing.

TEACHING GOALS – LEARNING OUTCOMES

Through this particular teaching, it is intended that students will be able to:

a. Knowledge

- recognize the basic axis of organization and the basic structure of a narrative text,
- identify the basic elements of the narrative: place, time, characters and their role in shaping the plot.

b. Understanding
- identify and critically comment on elements, such as a) the function of the antithetical presentation and conflict of two characters and b) the role of the reversal in the development of a narrative,
- point out the basic messages of the story.

c. Skills
- practice in observing the image, sound and moves and to be able to understand the significance of the different semiotic modes in presenting a message,
- transform the information of images, sounds and moves into a continuous narrative text,
- narrate, based on the superstructure of the narrative, a story with clarity.

d. Attitudes-Behaviors
- evaluate "stereotypical perceptions" and the way they can influence behavior,
- reflect and express their feelings to a familiar audience,
- appreciate, through their participation in group activities, the value of collaborative learning.

CLASS ORGANIZATION – TEACHING METHODOLOGY

The students are divided into four (4) groups of five (5) people. The instructor gives the groups a short time to designate the secretary and the representative of their group for the class plenary. Reciprocity and an equal distribution of work among the members of each group are encouraged. The teaching aids and materials used are the interactive whiteboard, on which the relevant video is presented, and the worksheets. Each group is provided with two copies of the worksheets in printed form, in order to facilitate the work of the groups. The instructor gives the necessary instructions, the groups study and answer, working simultaneously, on their two common worksheets, receiving the necessary support whenever they request it. The lesson plan follows the principles of inquiry-based learning and the collaborative group model. The indicative implementation time is estimated at two teaching hours.

TEACHING PROCEDURE - TEACHING PHASES

During the first teaching hour, after connecting with the previous lesson, which concerned the textual type of description, and after an introduction to the topic and information about the working method of the groups, the students watch a short video (SNACK ATTACK). Subsequently, divided into four (4) groups, they answer the activities of a common worksheet (Worksheet 1), lasting fifteen (15) minutes, in which they identify the basic elements of the narrative, the characters and their role in the development of the story, highlight its basic messages, comment on the semiotic modes of the audiovisual text and their role in conveying messages, and delve into the topic of "stereotypical perceptions" (critical literacy). In this phase, the students, utilizing the information they gather from the video, collectively record their answers on the worksheet and, subsequently, the representative of each group presents the work of their group to the class plenary, followed by discussion, synthesis, and drawing conclusions.

During the second teaching hour, the students, based on the theoretical framework of the superstructure of narrative, which emerged from the discussion of the first worksheet, are asked to answer a second worksheet (lasting 20 minutes), which concerns collaborative speech production (creative writing). In this, they are asked, based on what was discussed, to collaboratively write their own short narrative story with specific elements and criteria provided to them ("cognitive scaffolding"). The representative of each group presents their group's story to the class plenary and peer assessment takes place with a discussion about the strengths and weaknesses of the produced texts of the groups (lasting 20 minutes). Throughout the teaching process, the role of the instructor is guiding and supportive-advisory. A key objective is to smooth out any difficulties encountered by each group, so that their work is completed effectively within the predetermined time frame. This is followed by a brief self-assessment by the groups of the result of their writing work with specific criteria provided, and the teaching concludes with a recap of the main points, homework assignment, and announcement of the topic of the next lesson (lasting 10 minutes).

RESEARCH METHODOLOGY

MAIN PURPOSE OF THE RESEARCH AND CHARACTERISTICS OF THE SAMPLE

The main purpose of the research is to investigate the views of both the participating 1st grade Junior High School students and the observing teachers regarding the results of the utilization of multiliteracies and creative writing as alternative teaching methods for teaching Modern Greek Language in Junior High School. Forty-six (46) students (16 boys and 30 girls) from two 1st grade classes and fourteen (14) teachers participated in the research. In the two classes,

there are also six (6) registered Roma students, of whom two have inadequate attendance, while the other four female students, who participated in the teaching, have a very moderate cognitive background, and only one student is illiterate.

DATA COLLECTION TOOL

The research tool chosen for the purposes of this research is the questionnaire. To investigate the views of the participating a) students and b) teachers, two questionnaires were designed, the first with the target population being the students who participated in this model teaching (STUDENT QUESTIONNAIRE) and the second with the target population being the teachers who acted as observers (TEACHER QUESTIONNAIRE). The two questionnaires contain "closed-ended" questions, which have the advantage of being completed quickly and are suitable for statistical analysis, because they allow for clear and unambiguous answers. The answers are rated on a 5-point Likert scale. In addition, the questionnaire, as a methodological mechanism for recording and collecting data, is characterized by a series of comparative advantages (Robson, 2010), which align with the objectives of our research and are as follows:

- it offers a relatively simple and direct approach to investigating the behaviors of the sample, i.e., perceptions, attitudes, and values
- it facilitates the sincere and spontaneous expression of opinions due to the high degree of anonymity and confidentiality that it can ensure.

STRUCTURE OF QUESTIONNAIRES

Both questionnaires consist of three parts.

The first part of the student questionnaire concerns their demographic data (gender, age, nationality) in the form of three (3) closed-ended questions, while the corresponding part of the teacher questionnaire refers to their demographic data (gender, age, current employment status, years of experience in education, academic qualifications) in the form of five (5) questions. The second part of both questionnaires refers to the effectiveness of the utilization of multiliteracies and creative writing as methodological tools and is divided into three subsections. The first subsection, titled "**Multiliteracies**", consists of six (6) closed-ended questions, which concern the results of the application of multiliteracies in teaching, the second subsection, titled "**Creative Writing**", consists of five (5) closed-ended questions, which concern the results of the application of creative writing activity, and the third subsection, titled "**From Video-Multimodal Text to Creative Writing**", consists of seven (7) closed-ended questions, aiming to investigate the contribution of the utilization of multiliteracies to the production of written language by the students and the results of their combination in teaching. The third part of both questionnaires investigates elements concerning the "**Overall Perception and Experience**" and includes four (4) closed-ended questions.

QUESTIONNAIRE RESULTS

The following results emerge from the analysis of the answers of the participating students and the observing teachers of the sample.

Regarding the first axis, which concerns the demographic data of the students, it is observed that the majority of the sample consists of girls (60.8%, compared to 39.1% boys), while 100% of the sample has Greek nationality. Regarding the teachers of the sample, the presence of women is even stronger (85.7% women, 14.3% men), 50% of the sample lies in the 46-55 age group with extensive experience in education (21-30 years of service), while 60% have postgraduate studies in education.

Figure 2
Utilization of multimodal texts in daily teaching

In the second axis, which concerns the utilization of multiliteracies and creative writing, and specifically in the first subsection "Multiliteracies," 58.7% of the students in the sample answered that multimodal means (video, images, sound) are used quite often in daily teaching, while 57.1% of the teachers answered that they utilize such multimodal means with very high frequency (Figure 2).

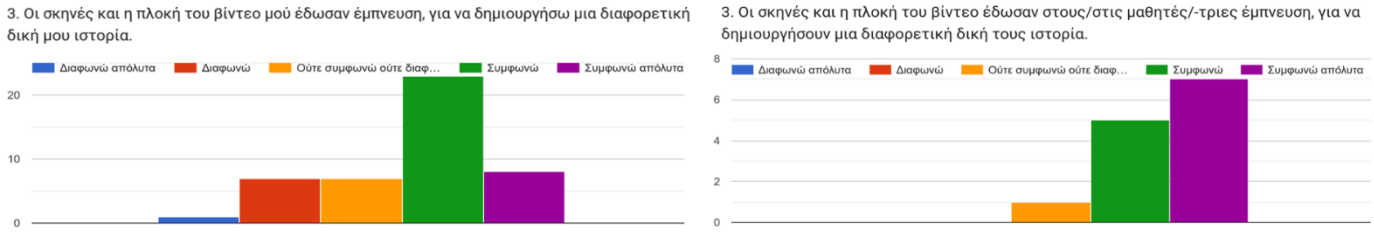
Further, the vast majority of the students in the sample, as well as of the teachers, converge to the idea that, for the teaching of narration, images and sounds can convey messages just as effectively as words. Additionally, the students and teachers in their great majority (83% and 92%, respectively) agreed that the video they watched helped them understand the structure of the story (Figure 3).

Figure 3
Contribution of audiovisual text to the understanding of narrative structure

Regarding the function of the group, the students stated in their majority (63%) that the collaboration with the members of their group was particularly helpful for the better utilization of a multimodal text in understanding the narration, a finding that is consistent with the corresponding opinion of the majority of teachers. It is considered noteworthy that both the students (78%) and the teachers (92%) share in an absolutely positive manner the view that the different media (textual, visual, auditory) can be combined for the narration of a story (Figure 4).

Figure 4
Contribution of the combination of different semiotic modes in narrating a story

In the second subsection concerning Creative Writing, the majority of the students (82%) agreed that through collaborative creative writing activities they managed to recognize the basic structure of a story (beginning, middle, end, climax, resolution, characters) (Figure 5), as well as to express ideas and feelings in a more free manner (74%), elements that were also confirmed by the answers from all observing teachers. An additional interesting finding is that 70% of the students are favorably disposed to the view that working in a group helped them share more ideas for the narration of the story, an element with which the great majority of teachers also agrees.

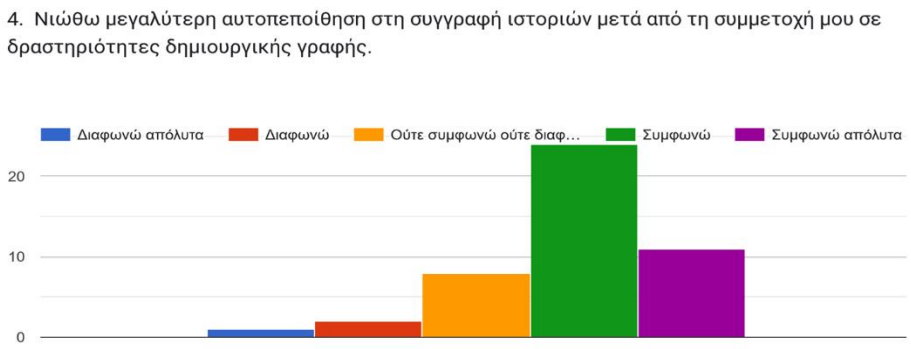


In the third subsection titled "From Video-Multimodal Text to Creative Writing," the students showed a positive attitude of 78% regarding how much the multimodal elements of the video (image, sound, music) can help them imagine the atmosphere of their own story (Figure 6), while they hold a more moderate stance, at a level of 55%, regarding as of whether the use of images and sounds in the video can help them think of new ways of narrating when writing their own story. In the corresponding questions, there is a partial differentiation in the views of the teachers, who show a clearly positive attitude in their entirety. Moreover, 67% of the students agreed that the multimodal elements of the video (image,

sound, music) can inspire the students to create a different story of their own, a finding with which the views of the teachers align perfectly.

Figure 5
Contribution of creative writing to the identification of the structure of narration

Figure 6
Contribution of multiliteracies to the production of narrative text



It is also considered significant that the students express themselves positively about the fact that the music and sound effects of the video gave them ideas for the emotional development of the characters in their story (72%). Finally, there is agreement in the opinions of the students and the observing teachers that the group discussion after the video screening helped the students to better organize their thoughts for writing their own story.

In the third and final axis concerning the "Overall Perception and Experience," the opinions of the students converge at an equivalent rate of 78%, firstly, that they feel that this specific teaching, which included the utilization of multiliteracies and creative writing, helped them improve their skills in narration (Figure 7) and, secondly, that they consider the utilization of multimodal means (video, image, sound) in the teaching of language courses important. Finally, it is evident that 76% of the students, through their participation in creative writing activities, feel greater confidence in writing stories (Figure 8), an opinion that was also confirmed by the vast majority of teachers.

Evaluation of teaching in terms of improving narration skills

Figure 8
Contribution of creative writing to enhancing confidence in writing

CONCLUSIONS

The evaluation of this teaching proposal, which focused on the teaching of narration through multiliteracies and creative writing activities, highlighted significant pedagogical benefits. The active and enthusiastic participation of the students in all stages of the teaching, their produced works, and the answers to the questionnaires confirm the successful understanding of the superstructure of narration and the acquisition of basic narrative skills.

The integration of audiovisual material, and specifically the utilization of video, facilitated the distinction of the fundamental elements of the narrative structure (place, time, characters, initial situation, problem, reaction, climax, solution). At the same time, the creative writing activity, and especially the collaborative speech production in groups, enhanced the self-confidence of the students, promoted collaborative work, and facilitated the understanding of the structure of narrative texts through the interaction between the members of the group.

Of particular importance is the positive impact of this specific teaching approach on students belonging to vulnerable population groups, such as the Roma, as well as on students with lower cognitive levels or limited familiarity with written language. The participation of these students, even the illiterate student, in the activities, albeit mainly at an oral level, highlights the importance of using multimodal texts (image, sound, speech) as a means of enhancing school participation and learning inclusion.

The adopted student-centered and experiential approach facilitated the taking of initiatives, strengthened interpersonal relationships within the student groups based on values such as respect and cooperation, and cultivated a climate of trust between students and the teaching instructor. Furthermore, the increased satisfaction of the students from their participation in creative writing activities highlighted the need for the utilization of alternative and creative approaches in the teaching of Modern Greek Language in Junior High School.

In conclusion, the integration of multimodal and audiovisual media in the teaching of Modern Greek Language, combined with creative writing activities, constitutes an innovative, effective, and inclusive teaching practice. This approach motivates students of different learning styles, differentiates teaching from the traditional, one-dimensional, and often discouraging text-centered methodology for many students, and fully aligns with the objectives of the new Curricula for Modern Greek Language in Junior High School.

APPENDIX
WORKSHEETS

1ο ΦΥΛΛΟ ΕΡΓΑΣΙΑΣ
Χρονική διάρκεια: 15 λεπτά
https://www.google.com/search?q=snack+attack

Άσκηση 1

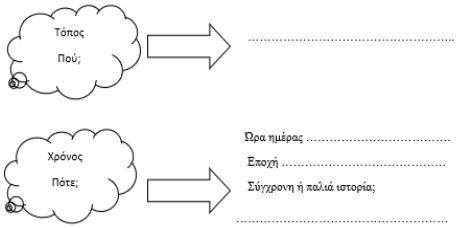
Πού πιστεύετε ότι θα μπορούσε κάποιος/α να παρακολουθήσει την ιστορία αυτή; Κυκλώστε τη σωστή απάντηση. **Π Ρ Ο Σ Ο Χ Η ! ! ! οι σωστές απαντήσεις μπορεί να είναι περισσότερες από μία.**

- Στην τηλεόραση
- Σε επιστημονικό περιοδικό
- Στο διαδίκτυο
- Σε δελτίο ειδήσεων

Άσκηση 2

Τι θέλει να δείξει η ιστορία που παρακολουθήσατε; Κυκλώστε τη σωστή απάντηση.

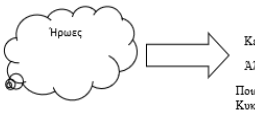
- Να περιγράψει τον σιδηροδρομικό σταθμό.
- Να περιγράψει τον χαρακτήρα της γιαγιάς και του νεαρού αγοριού.
- Να αφηγηθεί μια ιστορία που αφορά σε μια γιαγιά και σε ένα νεαρό αγόρι.
- Να πείσει ότι όλοι*ες* πρέπει να είμαστε πολύ προσεκτικοί*ές* με τα πράγματά μας.



Άσκηση 3

Συμπληρώστε δίπλα από τις παρακάτω προτάσεις το γράμμα «Σ», αν είναι σωστές, και το γράμμα «Λ», αν είναι λανθασμένες.

- Η γιαγιά αγοράζει μπισκότα από το περίπτερο, για να ταΐσει τα πουλιά του πάρκου.
- Η γιαγιά και το νεαρό αγόρι κάθονται στο παγκάκι και ακούνε μουσική στο κινητό τους.
- Το νεαρό αγόρι αρπάζει με ύπουλο τρόπο το κουτί με τα μπισκότα της γιαγιάς.
- Το νεαρό αγόρι, μετά από την επίθεση που δέχτηκε από τη γιαγιά, προκειμένου να της δώσει το τελευταίο μπισκότο, ανακαλύφθηκε τόσο πολύ που το έφαγε ολόκληρο μόνο του.
- Στο τέλος, αποδεικνύεται ότι η γιαγιά είχε μπερδευτεί και είχε πάρει το γλύκισμα του νεαρού.



Άσκηση 4

Με βάση την ιστορία που παρακολουθήσατε, γράψτε στα παρακάτω συννεφάκια τις απαντήσεις σας.

……

Ώρα ημέρας ……
Εποχή ……
Σύγχρονη ή παλιά ιστορία;
……

Κεντρικός/-ή ήρωας/-ίδα ……
Άλλοι χαρακτήρες ……

Ποια σχέση έχουν μεταξύ τους οι δύο βασικοί ήρωες;
Κυκλώστε τη σωστή απάντηση:
α. γιαγιά-εγγονός
β. άγνωστοι
γ. μητέρα-γιος

Άσκηση 5

Με ποιο γεγονός ξεκινάει η ιστορία που παρακολουθήσατε;

……
……

Άσκηση 6

Συμπληρώστε τις παρακάτω προτάσεις, προκειμένου να συνεχίσετε την εξέλιξη ιστορίας:

Όταν το νεαρό αγόρι βλέπει το πακέτο με τα μπισκότα δίπλα του (τι κάνει και γιατί;)

……
Η γιαγιά, βλέποντας αυτό, αντιδρά (με ποιον τρόπο;)……
πιστεύοντας ότι ……
Δημιουργείται ένταση και ο θεατής παρακολουθεί τη γιαγιά να
……
και τον νεαρό να……
Στο τέλος, έρχεται το τρένο, η γιαγιά επιβιβάζεται σ' αυτό και τότε (τι συνειδητοποιεί και πώς;)
……
……
Η ιστορία τελειώνει με τη γιαγιά να …… ……
……
και τον νεαρό να ……

Άσκηση 7

Σας δίνονται κάποιες εικόνες από το βίντεο που παρακολουθήσατε, οι οποίες δεν έχουν μπει σε σωστή χρονική σειρά. Γράψτε στον κύκλο που βρίσκεται μέσα στην κάθε εικόνα έναν αριθμό από το 1-8, προκειμένου να βάλετε τις εικόνες σε σωστή χρονολογική σειρά.

Άσκηση 8

Σε ποιο σημείο της ιστορίας νιώσατε τη μεγαλύτερη αγωνία για το τι θα συμβεί στη συνέχεια;

……
……

Άσκηση 9

Ας δούμε τώρα τις συναισθηματικές διακυμάνσεις από τις οποίες περνάει η ηρωίδα μας. Μπορούμε να καταλάβουμε τα συναισθήματά της, παρατηρώντας τις εικόνες; Δείτε τις προσεκτικά και γράψτε κάτω από καθεμία εικόνα το βασικό συναίσθημα (ή και άλλα συναισθήματα) που πιστεύετε ότι νιώθει η ηρωίδα.

Άσκηση 10

Αν βλέπατε το ίδιο βίντεο χωρίς ήχο, πιστεύετε ότι θα ήταν το ίδιο ενδιαφέρον; Πώς κατά τη γνώμη σας, συμβάλλει ο ήχος στη μετάδοση του μηνύματος;

……
……
……

Άσκηση 11

Πώς θα χαρακτηρίζατε τη γιαγιά από τις αντιδράσεις της στην ιστορία και γιατί;
(περισσότερες από μία απαντήσεις)

- σοφή
- νευρική
- επιπόλαια
- εργατική
- στοργική

Αιτιολόγηση:……
……

Άσκηση 12

Πώς θα χαρακτηρίζατε το νεαρό αγόρι από τις αντιδράσεις του στην ιστορία και γιατί;
(περισσότερες από μία απαντήσεις)

- ανήσυχο
- ενθουσιώδες
- έκπληκτο
- επιθετικό
- ατάραχο

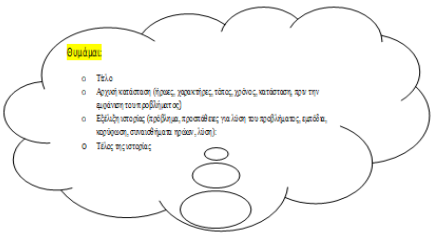
Αιτιολόγηση:……
……

Άσκηση 13

Ποιον από τους δύο ήρωες συμπαθήσατε περισσότερο; Αιτιολογήστε την επιλογή σας.

……
……

Άσκηση 14



Δώστε έναν δικό σας τίτλο στην ιστορία που παρακολουθήσατε και γράψτε ένα μήνυμα που αντλήσατε από την ιστορία αυτή.

……

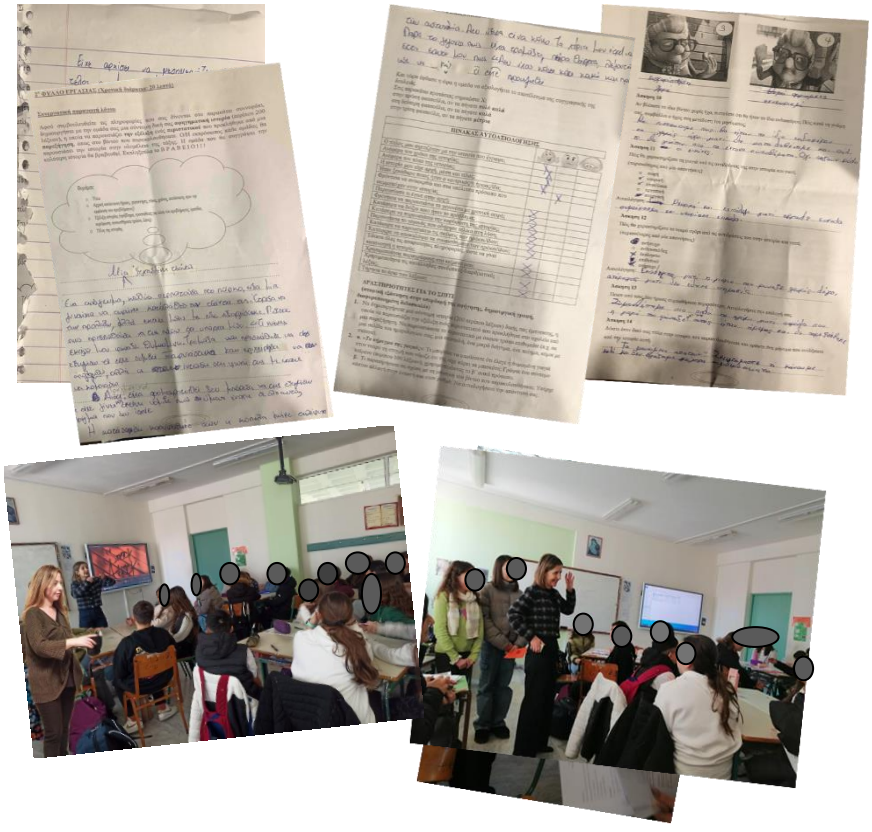
2ο ΦΥΛΛΟ ΕΡΓΑΣΙΑΣ (Χρονική διάρκεια: 20 λεπτά)

Συνεργατική παραγωγή λόγου

Αφού συμβουλευθείτε τις πληροφορίες που σας δίνονται στο παρακάτω συννεφάκι, δημιουργήστε με την ομάδα σας μια σύντομη δική σας **αφηγηματική ιστορία** (περίπου 200 λέξεων), η οποία να παρουσιάζει **την εξέλιξη** ενός **περιστατικού** που προκλήθηκε από μια **παρεξήγηση**, όπως στο βίντεο που παρακολουθήσατε. Ο/Η εκπρόσωπος κάθε ομάδας θα παρουσιάσει την ιστορία στην ολομέλεια της τάξης. Η ομάδα που θα συγγράψει την καλύτερη ιστορία θα βραβευθεί.

.....
.....
.....
.....
.....
.....
.....
.....
.....
.....

.....
.....
.....
.....



Και τώρα έφθασε η ώρα η ομάδα να αξιολογήσει το αποτέλεσμα της συγγραφικής της δουλειάς.
Στις παρακάτω προτάσεις σημειώστε Χ:
στην πράτη φατσούλα, αν τα πήγατε **πολύ καλά**
στη δεύτερη φατσούλα, αν τα πήγατε **καλά**
στην τρίτη φατσούλα, αν τα πήγατε **μέτρια**

ΠΙΝΑΚΑΣ ΑΥΤΟΑΞΙΟΛΟΓΗΣΗΣ			
Ο τίτλος μου σχετιζόταν με την ιστορία που έγραψα;			
Ανέφερα τον χρόνο της ιστορίας;			
Ανέφερα τον τόπο της ιστορίας;			
Η ιστορία μου είχε αρχή, μέση και τέλος;			
Ήταν ξεκάθαρο ποιος ήταν ο κεντρικός/ή ήρωας/ίδα;			
Φρόντισα να αναφερθώ και στα υπόλοιπα πρόσωπα που συμμετείχαν στην ιστορία;			
Παρουσίασα τι έγινε στην αρχή;			
Φρόντισα να παρουσιάσω τα γεγονότα με χρονική σειρά;			
Κατάφερα να δείξω ποιο ήταν το πρόβλημα;			
Κατάφερα να παρουσιάσω την κορύφωση της ιστορίας;			
Παρουσίασα το γεγονός που οδήγησε τελικά στη λύση;			
Κατάφερα να παρουσιάσω τις σκέψεις των ηρώων/ίδων;			
Κατάφερα να αποκαλύψω τα συναισθήματα των ηρώων/ίδων;			
Έδωσα όλες τις απαραίτητες πληροφορίες, ώστε να γίνει κατανοητή η ιστορία;			
Χρησιμοποίησα παραγράφους στο κείμενό μου;			
Χρησιμοποίησα τις κατάλληλες συνδετικές-διαρθρωτικές λέξεις;			
Τήρησα το όριο των λέξεων;			

ΔΡΑΣΤΗΡΙΟΤΗΤΕΣ ΓΙΑ ΤΟ ΣΠΙΤΙ (ατομική εξάσκηση στην υπερδομή της αφήγησης, δημιουργική γραφή, διαφοροποιημένη διδασκαλία)

1. Να δημιουργήσετε μια σύντομη ιστορία (200 περίπου λέξεων) δικής σας έμπνευσης, η οποία να παρουσιάζει την εξέλιξη ενός περιστατικού που προκλήθηκε στο σχολείο από μια παρεξήγηση. Να παρουσιάσετε το περιστατικό με όποιον τρόπο επιθυμείτε (π.χ. σε μια σελίδα του ημερολογίου σας, μια επιστολή, ένα μικρό διήγημα, ένα ποίημα, κόμικς με σκίτσα).
2. «***Το κήρυγμα της γιαγιάς***»: Τι μπορείτε να υποθέσετε ότι έλεγε η θυμωμένη γιαγιά στον νεαρό τη στιγμή που νόμιζε ότι της είχε πάρει τα μπισκότα; Γράψτε ένα σύντομο κείμενο (περίπου 100 λέξεων), χρησιμοποιώντας το β΄ ενικό πρόσωπο.

INDICATIVE STUDENT-PRODUCED WORKS

TRANSFORMING PHYSICS TEACHING: THE ROLE OF CRITICAL PEDAGOGY AND ICTS

Maria Magaliou
Physics Teacher - PHD candidate, Department of Pedagogy and Primary Education,
National and Kapodistrian University of Athens, Greece
Email: mvpmag@gmail.com

ABSTRACT

Modern physics teaching faces the challenge not only of transmitting knowledge but also of cultivating Critical Scientific Literacy, which involves developing critical thinking and connecting science with social issues. This paper examines how Critical Pedagogy, along with Information and Communication Technologies (ICTs), can contribute to achieving this crucial goal. While ICTs offer significant potential for making physics teaching more interactive and effective, their successful integration is hampered by considerable challenges. Critical Pedagogy, rooted in the work of Freire, provides the foundational framework for fostering dialogue, questioning, and the connection of physics with social and technological developments, essential components of Critical Scientific Literacy, making the subject matter more accessible and relevant. ICTs complement this approach by offering interactive environments, simulations, and opportunities for collaborative learning, thereby enhancing understanding, particularly of abstract concepts, within this critical framework. The paper identifies the key difficulties in ICTs integration concerning teachers, students, infrastructure, and pedagogy. The literature review suggests that the combined application of Critical Pedagogy and ICTs offers a powerful synergy that can transform physics teaching into an active, interactive, and socially oriented process, potentially mitigating some of these identified challenges and fostering Critical Scientific Literacy. Students develop critical thinking, actively construct knowledge, and understand physics as a living science connected to society, thus shaping responsible, engaged citizens equipped with Critical Scientific Literacy.

Keywords: Critical Pedagogy, Critical Scientific Literacy, Information and Communication Technologies (ICTs), Physics Teaching, Social justice

INTRODUCTION

Physics teaching in the 21st century faces a series of complex challenges, extending beyond the simple transmission of scientific concepts and principles. In the modern educational environment, physics is called upon to contribute to students' holistic development, cultivating skills essential for Critical Scientific Literacy, such as critical thinking, scientific inquiry, and social awareness (Osborne, 2010). Furthermore, the need to enhance student participation in the learning process and address educational inequalities is becoming increasingly urgent (UNESCO, 2015). Science education is a cornerstone for understanding the world around us and for shaping active citizens capable of meeting the challenges of our time. However, traditional teaching models, which are primarily focused on knowledge transmission, often fail to develop the critical thinking, creativity, and social awareness inherent in Critical Scientific Literacy. Within this framework, Critical Pedagogy and Information and Communication Technologies (ICTs) emerge as two powerful approaches that can be combined to fundamentally transform physics teaching, making it more engaging, effective, and socially just, particularly in fostering Critical Scientific Literacy.

This paper presents a literature review on the synergy between Critical Pedagogy and ICTs in physics teaching, focusing on its contribution to Critical Scientific Literacy. The goal is to explore how these two approaches, when effectively integrated, can contribute to students' active participation, the development of the specific critical thinking skills inherent in Critical Scientific Literacy, and the understanding of physics as a science inextricably linked to social issues and daily life. The central research question guiding this paper is: How can the combined application of Critical Pedagogy and ICTs improve physics teaching, enhancing the understanding of physical phenomena while also fostering Critical Scientific Literacy, thereby promoting social awareness and active citizenship among students?

RESEARCH QUESTION AND METHODOLOGY

The central objective of this paper is to investigate the transformative potential of integrating Critical Pedagogy with Information and Communication Technologies (ICTs) in the domain of physics education, specifically focusing on the development of Critical Scientific Literacy. This inquiry is encapsulated in the primary research question: How can the combined application of Critical Pedagogy and ICTs improve physics teaching, enhancing the understanding of physical phenomena while also fostering Critical Scientific Literacy, thereby promoting social awareness and active citizenship among students? This question seeks to explore not only the pedagogical efficacy of such a synergistic approach in terms of conceptual understanding but also its capacity to cultivate critical consciousness and civic engagement regarding scientific matters, aligning physics education with broader societal needs through the lens of Critical Scientific Literacy.

To address this multifaceted research question, the paper adopts a literature review methodology. This methodological approach was selected as it allows for a comprehensive synthesis of existing scholarly work, theoretical frameworks, and empirical findings pertinent to Critical Pedagogy, ICTs integration in education, and their specific application within physics teaching aimed at fostering Critical Scientific Literacy. The review will systematically examine academic journals, conference proceedings, books, and relevant reports to: (1) Identify the core tenets of Critical Pedagogy relevant to science education and the cultivation of Critical Scientific Literacy. (2) Explore the diverse applications and affordances of ICTs in creating interactive and engaging learning environments for physics that support a critical approach. (3) Investigate documented instances, theoretical arguments, and empirical evidence supporting the synergistic potential of combining these two approaches for the development of Critical Scientific Literacy. (4) Uncover the benefits for student learning, critical thinking development specifically within science, and the cultivation of social awareness regarding scientific and technological issues. (5) Identify potential challenges, limitations, and best practices associated with such an integration for fostering Critical Scientific Literacy.

By thoroughly analyzing and synthesizing the existing literature, this paper aims to provide a robust theoretical foundation for understanding how the deliberate fusion of Critical Pedagogy and ICTs can redefine physics teaching, making it a more dynamic, relevant, and empowering experience for students, thereby contributing to the development of scientifically literate (in the critical sense) and socially responsible citizens.

CRITICAL PEDAGOGY AS A THEORETICAL FRAMEWORK FOR PHYSICS TEACHING

Critical Pedagogy analyzes the ways in which educational systems contribute to the reproduction of social inequalities, while also exploring their potential as a tool for promoting social justice. According to this view, the learning process is not neutral but is shaped by the social, political, and economic forces prevailing in society. Consequently, education functions as a space where dominant ideologies are embedded in students' consciousness, thereby limiting their critical thinking and their ability to question existing structures and practices (Skordoulis & Katsiampoura, 2019).

Critical Pedagogy, rooted in the pioneering ideas of Paulo Freire, constitutes a radical educational philosophy that challenges traditional, authoritarian teaching methods and promotes education based on dialogue, questioning, and critical analysis of reality (Freire, 1970). At the core of Critical Pedagogy is the opposition to "banking-style education," where students are treated as passive recipients of knowledge, lacking the critical thinking and the ability to form their own opinions essential for Critical Scientific Literacy (Giroux, 2024, pp. 123-124). Instead, Critical Pedagogy advocates for an empowering education that recognizes students as active subjects of learning and cultivates their ability to question, investigate, and transform the world around them, fostering their Critical Scientific Literacy (Kincheloe, 2008, pp. 8-14).

Within the context of physics teaching, Critical Pedagogy can serve as a powerful theoretical framework for revising traditional teaching methods and introducing innovative practices aimed at fostering Critical Scientific Literacy. Physics teaching, when approached from a democratic perspective, does not align with traditional teaching and learning models based exclusively on authority. On the contrary, it necessitates building classroom interaction that promotes dialogue, a key component of developing critical understanding. The authoritarian structure of the classroom acts as a tool of control, hindering the development of balanced power dynamics among participants, and thus impeding the cultivation of critical perspectives needed for Critical Scientific Literacy. Through this organization, the educational system serves to define and distribute skills in a way that reproduces the existing social and economic structure (Skordoulis, 2014, pp. 263-264). Specifically, Critical Pedagogy encourages moving beyond the fragmented and decontextualized teaching of physics, proposing an approach that connects physics concepts with daily life and social issues, which is crucial for developing Critical Scientific Literacy (Hodson, 2014). Instead of presenting physics as a set of abstract theories and equations, Critical Pedagogy proposes highlighting the importance of physics for understanding and addressing real problems that concern society (Bencze & Alsop, 2014). For example, the teaching of thermodynamics can be linked to issues such as the energy crisis and climate change, encouraging students to critically question energy policies and the environmental impacts of technological development, thereby exercising aspects of Critical Scientific Literacy.

Critical Pedagogy emphasizes the importance of creating a learning environment based on dialogue, collaboration, and interaction among students and between students and teachers. According to this approach, the teacher does not function as the sole authority of knowledge but as a facilitator of the learning process, encouraging students to develop their critical thinking and form their own opinions through dialogue and questioning (Aronowitz, 2004, pp. 8-23). In the physics classroom, this can translate into activities that promote discussion, group work, and challenging assumptions, giving students the opportunity to express their ideas, question established knowledge, and construct their own understanding of physical phenomena, fostering the critical dimension of their scientific literacy. Through such practices, physics education becomes a tool of empowerment for students, promoting social justice and active citizenship, underpinned by Critical Scientific Literacy.

In today's world, increasingly shaped by science and technology, Critical Scientific Literacy is now an essential asset. It empowers us to evaluate scientific information, make sound decisions about our health, the environment, and other crucial issues. It allows us to participate knowledgeably in discussions about climate change, genetically modified organisms, or new technologies, and, crucially, to distinguish scientifically substantiated knowledge from misinformation, while also understanding the context and implications of that knowledge. Critical Scientific Literacy is not merely useful, but essential for survival and well-being in modern society. By strengthening science education in this way, we create more informed, critical, and capable citizens better equipped to face future challenges (Allchin, 2014). Critical Pedagogy empowers students to question and analyze information. Applied to science, it directly fosters the skills needed for Critical Scientific Literacy; it promotes critical thinking about scientific claims, methods, and their social implications. This helps in understanding the nature of science and in active participation in socio-scientific issues, making this form of scientific literacy a potent tool for active citizenship and social action (Luitel et al., 2022).

ICTs AS TOOLS FOR ENHANCING PHYSICS TEACHING

The integration of technology into physics teaching brings substantial changes. It transforms methods and enriches learning experiences, offering a dynamic approach. It facilitates the understanding of complex concepts, overcoming the difficulties often faced by traditional approaches, making learning more effective and engaging (Faresta et al., 2024). Information and Communication Technologies (ICTs) offer a wide range of tools and capabilities that can enhance physics teaching. In the modern digital age, ICTs are not merely supplementary tools but an integral part of the educational process, offering new ways to approach subject matter and facilitate interaction among students and between students and teachers (Greca et al., 2014). In the context of physics teaching, ICTs can be used to create interactive learning environments, provide simulations and virtual laboratories (Zacharias & Anderson, 2003), access online information sources, and enhance collaborative learning (Dillenbourg, 1999).

One of the most significant advantages of ICTs in physics teaching is the ability to provide interactive simulations and virtual laboratories. Physics often involves abstract concepts, phenomena occurring across various temporal or spatial scales (very small or very large), or situations that are difficult or impossible to observe directly or reproduce in the classroom or school laboratory. For example, visualizing electric fields, understanding the motion of atoms, observing waves in different media, or investigating experiments with very high energies or hazardous materials are often unfeasible in everyday teaching. This is precisely where the immense value of interactive simulations becomes apparent. They allow students to visualize these abstract concepts and processes. They can visualize electric charges and their fields, observe the behavior of molecules, the propagation and interaction of waves, or the motion of an object under the influence of various forces. The possibility of this direct visualization bridges the gap between theory and imagination, making concepts more accessible and understandable (Jimoyiannis & Komis, 2001).

Beyond visualization, the element of interactivity is crucial. In a simulation, students are not just passive observers. They can manipulate variables, change parameters (e.g., voltage in a circuit, mass of an object, frequency of a wave), and directly observe in real time how these changes affect the phenomenon. This experimentation capability allows students to formulate and test their own hypotheses, explore cause-and-effect relationships, and discover physical principles through active investigation (Adams et al., 2008).

Virtual laboratories go a step further, seeking to replicate entire laboratory procedures. Study results indicate that virtual laboratories improve student performance when used as a learning tool (Radhamani et al., 2014). Students can select virtual equipment, connect it correctly, perform measurements, and collect data. Adjustments and repetitions can be performed much faster in a virtual environment, thereby maximizing the time available for understanding and analysis. Practice in a virtual laboratory can prepare students for a real experiment, helping them understand the procedure and equipment, reducing errors, and increasing the efficiency of the actual lab. Furthermore, Measurement with Sensor systems (MBL) allows for real-time data collection and analysis, enhancing student engagement in authentic scientific processes (Sokoloff et al., 1999).

Furthermore, the use of simulations and virtual laboratories contributes to the development of critical thinking and scientific methodology. Through interactivity, students learn to ask questions, formulate hypotheses, design experiments (in the virtual environment or simulation), collect and analyze data, and draw conclusions. This brings them closer to the nature of science and the way scientists work (Rutten et al., 2012).

It is important to note that simulations and virtual laboratories cannot and should not completely replace real experiments. Interaction with the physical world, dealing with unforeseen situations, developing fine manipulative skills, and understanding the limitations of real equipment are aspects that only the traditional laboratory can offer. However, digital tools are an excellent complement, a means that enriches and extends the possibilities of physics teaching, making it more dynamic, accessible, and engaging for 21st-century students. Their successful integration requires appropriate pedagogical design by the teacher to maximize their potential for the benefit of the learning process (Hofstein & Lunetta, 2004).

Furthermore, ICTs facilitate access to a wide range of online information sources, such as scientific articles, educational videos, interactive websites, and online encyclopedias. This ease of access to information allows students to delve deeper into topics of interest, explore different aspects of physical phenomena, and develop self-directed learning skills (Suana, 2018).

Finally, ICTs support collaborative learning and communication among students and between students and teachers. Online learning platforms, discussion forums, and collaboration tools allow for the exchange of ideas, asking questions, and providing feedback, creating a learning community where students can learn from one another and collaborate on problem-solving (Dillenbourg, 1999). Of course, before implementing e-learning or blended learning modalities, teachers must consider the significant differences among students regarding their internet access, available technological tools, motivations for using the internet, and personal learning preferences. It is crucial not to assume equal technological access or familiarity for all students, as factors such as gender or grade level can significantly impact their effective participation (Suana, 2018). Furthermore, understanding students' motivations and preferences allows teachers to select or adapt appropriate and engaging digital content, thereby enhancing the learning experience and performance.

CHALLENGES AND DIFFICULTIES IN ICTs INTEGRATION IN PHYSICS

Despite the clear potential of ICTs discussed above, their successful implementation in the school environment, particularly in physics teaching, faces numerous significant challenges and difficulties. These obstacles are multifaceted

and impact various components of the educational system (Voogt, 2013). Understanding these barriers is crucial for developing effective strategies to overcome them and fully realize the benefits of ICTS integration.

For teachers, significant obstacles include the lack of sufficient training and professional development in the pedagogical utilization of ICTs (Hew & Brush, 2007). Teachers often lack not only the necessary technical skills but primarily the pedagogical knowledge required to integrate ICTs in a way that substantively supports learning objectives and promotes active learning in physics (Mishra & Koehler, 2006). Furthermore, resistance to changing established teaching practices, which may stem from insecurity, fear of the unknown, or adherence to traditional models, hinders the adoption of new technological tools. Concurrently, the increased workload associated with searching for, evaluating, adapting, and implementing lessons using ICTs, as well as managing potential technical problems during the lesson, can discourage teachers from using them systematically (Inan & Lowther, 2010).

For students, difficulties include the existence of the "digital divide," referring to unequal access to technology and the internet outside of school, as well as varying levels of digital literacy that can affect their ability to effectively use digital tools for learning (Warschauer, 2003). Moreover, potential distraction when using ICTs in the classroom, due to the availability of entertainment content or other non-educational applications, constitutes a management challenge for the teacher. Finally, technical access problems, such as weak internet connection, device incompatibility, or software issues, can disrupt the learning flow and lead to frustration for both students and the teacher.

Regarding infrastructure and resources, the lack of sufficient and modern technological equipment (computers, tablets, interactive whiteboards, network equipment) in schools constitutes a fundamental obstacle (Cuban, 2001 pp.177-181). The cost of purchasing, upgrading, and maintaining the equipment, as well as acquiring software licenses, is often prohibitive for school institutions. Furthermore, insufficient or non-existent technical support, which could quickly and effectively resolve technical issues, leaves teachers and students to address malfunctions independently, reducing the reliability and frequency of ICTs use.

Finally, significant challenges are identified within the pedagogical framework and content. Ineffective pedagogical integration of ICTs, where technology is used merely as a substitute for traditional methods instead of transforming the teaching process, limits its potential benefits (Hughes et al., 2006). The difficulty in assessing learning in ICTs-rich environments, especially concerning the evaluation of higher-order skills such as critical thinking and complex problem-solving, necessitates the development of new assessment tools and methods. Additionally, the challenge of selecting and evaluating appropriate, scientifically accurate, and pedagogically sound digital educational material for physics from the vast volume of available online resources requires teachers' time, expertise, and critical judgment.

COMBINING CRITICAL SCIENTIFIC LITERACY AND ICTS: A TRANSFORMATIVE SYNERGY FOR PHYSICS TEACHING

Addressing these pervasive challenges requires a comprehensive and nuanced approach. The combined use of Critical Scientific Literacy and ICTs in physics teaching emerges as a powerful synergy, capable of fundamentally reshaping the educational process and offering a renewed and more effective approach. ICTs, in this context, are not limited to the role of mere technological tools but serve as a catalyst, accelerating and reinforcing the practical application of the fundamental principles of Critical Scientific Literacy. Through this synergy, learning environments are created that do not settle for simple information transmission but aim to activate critical thinking, encourage active participation, and cultivate students' social awareness. For example, simulations and virtual laboratories can be used as a basis for inquiry-based activities led by students, enhancing autonomy and critical thinking (Veermans et al., 2000).

Specifically, ICTs provide concrete means and capabilities that facilitate the implementation of the core principles of Critical Scientific Literacy. The promotion of dialogue, a central element of Critical Scientific Literacy, finds a powerful ally in ICTs. Access to diverse sources of information can encourage students to question single-perspective narratives and seek alternative perspectives for understanding scientific concepts and social implications (Levinson, 2010). Collaborative activities using ICTs can enhance dialogue, interaction, and mutual support among students, creating a learning environment that promotes social justice and equal participation for all (Stahl et al., 2014). Online learning platforms, discussion forums, and collaboration tools, as mentioned earlier, create virtual spaces where students can exchange views, express concerns, and interact with each other and the teacher. Through these digital interactions, dialogue becomes more accessible and sustained, overcoming the limitations of traditional, often time-constrained, classroom dialogue.

Simultaneously, the encouragement of questioning, another fundamental element of Critical Scientific Literacy, is significantly enhanced through the use of ICTs. Direct access to diverse sources of information, with different

perspectives and origins, provided by ICTs, enables students to verify information, compare different interpretations, and question established knowledge (McGrew, 2018). The critical evaluation of online sources, recognizing potential biases, and distinguishing valid from unreliable information become essential skills for the critical student of the 21st century.

Furthermore, linking knowledge to social reality, a primary aim of Critical Scientific Literacy, finds valuable tools in ICTs. Interactive simulations and virtual laboratories, for example, can be used not only for understanding abstract physics concepts but also as a starting point for discussions about the social and ethical dimensions of scientific knowledge and technological applications. For instance, a simulation on electricity generation can lead to a critical discussion about the environmental impacts of different energy sources, social inequalities in energy access, and political decisions shaping the energy future.

The literature review confirms that the combined use of Critical Scientific Literacy and ICTs in physics teaching can transform the learning process, making it more experiential, interactive, and socially oriented. Through the effective combination of dialogue, questioning, critical analysis, and the use of technological tools, students gain not only a deeper understanding of scientific concepts but also develop critical thinking skills, essential skills for the modern world. Furthermore, they perceive physics not as an isolated body of abstract knowledge but as a dynamic science inextricably linked to society and everyday life. Finally, this holistic approach contributes to the creation of active and aware citizens, capable of facing the complex challenges of the 21st century and actively participating in shaping a more just and sustainable future for all (Kincheloe & McLaren, 2011).

ILLUSTRATIVE EXAMPLES OF THE COMBINED APPROACH

To further illustrate how Critical Scientific Literacy and ICTs can be synergistically applied in physics teaching, this section presents two brief examples, presented in (Table 1) and (Table 2)."These examples are designed to move beyond traditional knowledge transmission and engage students in critical thinking about physics concepts in relation to real-world issues and societal contexts, leveraging the capabilities offered by digital tools.

Table 1
Example 1: Newton's Laws of Motion, the ISS, and Critical Thinking

Physics Topic	Newton's Laws of Motion (Inertia, Force and Acceleration, Action-Reaction).
ICTs Tools	Interactive simulations (e.g., PhET simulations related to forces, motion, or gravity), Educational videos (e.g., videos from the European Space Agency - ESA - demonstrating life and experiments on the International Space Station - ISS).
Critical Pedagogy Dimension	Connecting abstract physics principles to a large-scale, complex technological project with significant global societal implications; prompting critical discussion about the role of science and technology in society, international collaboration, resource allocation (cost of space vs. other needs), and the broader benefits and ethical considerations of space exploration.
Teaching Approach	Students can begin by exploring Newton's Laws through interactive simulations like those offered by PhET. These simulations allow for direct manipulation of variables (mass, force, friction) and observation of resulting motion, building a foundational conceptual understanding. Subsequently, students can watch videos of astronauts on the ISS demonstrating seemingly counter-intuitive phenomena in microgravity (e.g., pushing off walls, how objects move when propelled, or the physics of maintaining orbit). Using these videos as concrete examples, the teacher can guide a discussion connecting the observed phenomena back to Newton's Laws, helping students see the universal applicability of these principles even in extreme environments. This sets the stage for critical engagement. The discussion can expand to the broader context of the ISS. While the ISS is a remarkable feat of engineering and a unique scientific laboratory, it also raises questions about its purpose and impact. Drawing on information about the benefits derived from ISS research, such as advancements in:

	Medicine and Health**:** Understanding and mitigating bone density loss and muscle atrophy, development of new pharmaceuticals, telemedicine, improved life support systems (air/water filtration). Environment and Earth Observation**:** Monitoring climate change and natural disasters, improving agricultural practices through Earth observation data. Technology and Industry: Development of new materials and coatings, improved communication and navigation systems. These points, while not directly physics concepts, provide the *context* for critical questioning. For instance, students can be prompted to discuss: Who benefits most from ISS research? What are the ethical considerations of using space resources or conducting experiments that might have terrestrial applications? How does the significant investment in projects like the ISS compare to investments in addressing immediate social problems on Earth? How does international collaboration on the ISS serve broader political or social goals? By linking the physics principles governing the station's operation to these real-world implications and benefits, students are encouraged to view physics not just as abstract theory, but as a science deeply embedded within societal structures and ethical considerations.

Table 2.
Example 2: Electrical Energy Production and Societal Impacts

Physics Topic	Principles of electricity generation (e.g., electromagnetic induction, energy transformation from various sources - thermal, kinetic, solar, nuclear - into electrical energy).
ICTs Tools	Educational videos illustrating different methods of electricity production (e.g., how power plants, solar farms, wind turbines, or nuclear reactors generate electricity).
Critical Pedagogy Dimension	Using the physics of energy production to initiate critical discussions about social justice, environmental ethics, public health, and the relationship between technology and society in the context of energy.
Teaching Approach	After introducing the basic physics principles underlying electricity generation (e.g., the concept of converting different forms of energy into electrical energy, the role of magnetic fields and conductors), students can watch a video showcasing various methods of energy production (e.g., fossil fuel power plants, hydroelectric dams, wind farms, solar arrays, nuclear power plants). The video provides visual and conceptual context for the different technologies and their scale. Building upon this foundation, the teacher can facilitate critical discussions using the video as a springboard and connecting it to the students' own experiences and the wider world. The following questions, framed through a critical pedagogy lens, can guide this exploration: Social Dimension: Energy Justice*:* Who has access to electrical energy and who does not? How are the benefits and burdens of electricity production and distribution allocated within society? How can we ensure equitable access to energy for all, regardless of income or geographical location? Social Impacts of Energy Choices*:* How do different energy sources affect local communities (e.g., jobs, pollution, health)? How do energy decisions influence relationships between different social groups (e.g., farmers vs. industrial workers, urban vs. rural areas)? Public Health: How does air pollution from electricity production affect human health, particularly in vulnerable populations (children, the elderly, individuals with respiratory problems)? Ethical Dimension: Environmental Ethics*:* What is our moral obligation to protect the environment from the impacts of electricity production? How do we

	balance the need for energy with the protection of ecosystems and biodiversity? Intergenerational Justice*:* Do we have a moral obligation to future generations to choose sustainable energy sources, even if they are more expensive in the short term? How do we account for the long-term consequences of our energy choices? Responsibility and Accountability*:* What are the ethical responsibilities of engineers, scientists, policymakers, and corporations involved in electricity production and distribution? How do we ensure transparency and accountability in energy decision-making? Technological Determinism vs. Social Choice: Is technology neutral, or does it embody inherent values? How do social values and political choices shape the development and application of electricity generation technologies? By prompting students to consider these questions, the activity moves beyond simply explaining *how* electricity is generated to exploring *why* certain methods are chosen, *who* benefits, *who* is harmed, and *what values* are embedded in our energy systems. The video serves as an initial point of reference, but the critical dialogue transforms the learning experience into an examination of physics in its broader socio-political context.

These examples demonstrate how readily available ICTS tools, when combined with a pedagogical approach rooted in Critical Pedagogy, can turn traditional physics topics into opportunities for developing critical thinking, fostering social awareness, and understanding the relevance of physics to real-world challenges.

CONCLUSION

This paper concludes that the thoughtful and synergistic integration of Critical Scientific Literacy and Information and Communication Technologies (ICTs) offers a potent and much-needed paradigm shift for physics education. Moving beyond traditional transmission models, Critical Scientific Literacy provides the essential philosophical and pedagogical compass, emphasizing the development of critical consciousness, dialogue, and the vital connection between scientific knowledge and pressing social justice issues. ICTs, in turn, serve as powerful enablers, offering dynamic platforms for interactive simulations, collaborative knowledge construction, access to diverse information sources, and innovative ways to make abstract physics concepts tangible and relatable, thereby bringing the principles of Critical Scientific Literacy to life within the classroom.

The synergy born from this combination has the profound potential to cultivate learning environments that are not only more engaging and effective in fostering a deep understanding of physical principles but are also inherently more equitable and socially just. Students are encouraged not merely to absorb facts but to actively question, analyze, and construct knowledge, thereby honing their critical thinking skills and developing a robust social awareness. This approach positions physics not as an isolated academic discipline, but as a living science intrinsically linked to societal developments, ethical considerations, and the students' own lived experiences.

While the path to seamless ICTs integration is acknowledged to be paved with challenges—ranging from teacher training and infrastructural limitations to ensuring equitable access and pedagogically sound implementation—the combined framework of Critical Scientific Literacy and ICTs offers promising strategies to mitigate these difficulties. By foregrounding purposeful pedagogical integration, where technology is a tool in service of critical learning objectives, and by advocating for comprehensive support systems for both educators and learners, many of these obstacles can be proactively addressed.

To fully harness and validate the transformative power of this integrated approach, further rigorous empirical research is imperative. Future investigations should focus on: (1) Evaluating the measurable impact of specific integrated teaching strategies on diverse student outcomes, including conceptual mastery in physics, the development of critical thinking dispositions, levels of engagement, and the propensity for informed social action. (2) Exploring the adaptability and effectiveness of these combined approaches across varied educational contexts, considering differences in student demographics, institutional resources, and cultural settings. (3) Developing, piloting, and refining specific, replicable teaching modules and curricular frameworks that exemplify this synergy, offering practical guidance for educators. (4)

Investigating the long-term effects of such pedagogical interventions on students' academic trajectories and their engagement as critically aware and responsible citizens.

ABSTRACT

The research into the combined use of analog and digital technology in education, and specifically in the teaching of photographic act, constitutes the core focus of this article. The research questions center on the relationship between technology and photographic work, the transition from analog to digital photographic technology, and the understanding and use of media within the educational process. According to Bolz, the significance of a medium can only be understood through its interaction with other media - both contemporary and obsolete - and that older media serve as metaphorical aids for orientation within the digital realm (Bolz, 2008). Based on this perspective, a hands-on activity was designed as an educational practice in photography, which serves as the case study for the article. The methodology of the activity combines aspects of transformative and "incidental learning" (Bolz, 2008), alongside insights from visual culture scholars such as Gillian Rose. In the context of our current era - what Ong (2015) refers to as the "new orality," which connects new technologies to education and the role of digital imagery - the article seeks to intersect and integrate theoretical approaches and hands-on practices, aiming to draw conclusions regarding contemporary visual culture. The interaction between terms and critical theories brought to light both the influence of obsolete media on artistic production and the dynamic nature of the transition to new technologies. The activity was accompanied by a questionnaire, the findings of which offer valuable observations for educational practices and applications. The participants were primarily photography students, the majority of which responded positively, demonstrating that education through experiential practices has the potential to modify users' behavior towards a medium. At the same time, it revealed the participants' ability to understand and distinguish among different practices that define contemporary media. Overall, the playful dimension of the medium and the combined use of analog and digital technology emerged as an effective and valuable educational tool.

Keywords: new orality, digital photography, camera obscura, education, hands-on activity

Acknowledgements: The present research by Dimitrios Mastorakos and Evangelia Ntarara is part of their respective doctoral dissertations, which are being carried out and funded by the Special Account for Research Grants (ELKE) of the University of West Attica, within the framework of the Doctoral Studies Program.

INTRODUCTION

The hands-on activity that constitutes the case study of the present research explores the usefulness of an analog - now considered obsolete - medium in facilitating the understanding of new technologies, particularly in the field of digital photography. Therefore, it was necessary to formulate research questions, the answers to which are useful to evaluate within the framework of a certain 'historicity' and a transition of positions and concepts in media philosophy - transitions that indicate a fundamental shift in the relationship between the medium user and the medium itself, from older to newer technologies. Within this context, the article presents both a theoretical foundation for conceptualizing these transitions and a research methodology capable of capturing the emerging, modern-day relationships between users and media. To this end, a questionnaire was developed and used alongside the hands-on activity to yield meaningful insights.

THE "NEW ORALITY": THEORETICAL APPROACHES

According to Bolz (2008), media history can be structured as a progression: from orality, to literacy, and now to digitality. The transition to and use of technology in audiovisual media - within the framework of the era we are currently experiencing, that of "new orality" - which, as Ong (2015) suggests, is associated with the use of media and is simultaneously involved in and utilized by the educational process, constitutes the main theoretical framework of the present research.

The research questions explored in this study focus on the relationship between technology and photographic practice, the transition from analog to digital photographic technology, and the understanding and use of media within the educational process. Additionally, the study examines concepts such as user-friendliness (or lack thereof) in different environments - analog or digital - as well as the transparency or opacity of the medium used to transmit information. Taking into account Bolz's assertion that the significance of a medium can only be understood through its interaction with other media - both contemporary and obsolete - and "that older media serve as metaphorical tools for orientation in the digital domain" (Bolz, 2008:23), a hands-on activity was developed as an educational practice for photography, which constitutes the case study of this article.

At the same time, the playful dimension of the medium is indirectly explored, linking the notions of media understanding and use, as well as incidental learning, as reinterpreted by Bolz "in playful, dynamic learning environments through digitality and video games" (Bolz, 2008:130), which is considered to support the overall educational process by enhancing participants' skills.

The concepts of media transparency-opacity, the user-friendliness (or lack thereof) of the environment, the playful dimension of the medium, and the combined use of analog and digital technology are significant components and critical research tools that require particular attention. Their impact shapes the potential qualitative and quantitative function of media in education, while also highlighting the transformations that have occurred over time—on technological, social, and ultimately interdisciplinary levels.

These changes become more comprehensible through the perspectives of thinkers presented within the philosophy of media, who refer to the same concepts across a span of just a few decades. Flusser (1998), in his essay "Towards a Philosophy of Photography", argued that through a device (apparatus) - in this case, the camera - operated by a human, technical images are produced, whose "purpose is to represent the world and make it comprehensible to human beings. But even while doing so, they intervene between humans and the world. They are meant to be maps but become screens. Instead of representing the world to humans, they obscure it, placing themselves in its place, to the extent that a person lives as a function of the images they have produced" (Flusser, 1998:12). This reconstruction of reality, through technical images, takes place within the interior of the photographic camera - a black box - which conceals from the average user the operations that occur inside it.

In his text, Flusser urges the photographer to attempt to discover new categories of the camera - ones that have been overlooked or are absent from the device's program. In doing so, the photographer "positions themselves within the metaprogram of the photographic industry", becoming a programmer of the apparatus and approaching new domains of cultural values and relationships (Flusser, 1998:35). Taking into account as well that artworks or photographs can be produced without the use of machines - a practice known as camera-less photography - and that certain cameras, such as pinhole or low-cost cameras and homemade ones, are designed like toys, "the playful dimension of the artistic process" is emphasized (Markidou, 2015:130).

In contrast to the above approach, we accept not knowing what happens inside the black boxes. As Bolz notes: "Each black box (e.g., a camera) corresponds to a user illusion that makes ignorance manageable. This is precisely what the word interface means - a surface with two sides. Every user interface is a two-faced construct that simultaneously conceals two black boxes: the complex technology and the user's mental system… To take something "at face value" means: I trust the surface, I do not seek what lies hidden beneath. To take things 'at interface value' means that, in the world of new media, it suffices for me to simply use the interface…" (Bolz, 2008:137). "User-friendliness, which arises from the use of new media [from analog to digital], is what the sociologist Helmut Schelsky described as the illusion of familiarity: functional simplicity combined with structural complexity - easy to use, but difficult to understand. The intelligence of smart products lies in concealing the abyss of incomprehension. Thus, use is severed from understanding… In technologies that are easier to use than to explain, play becomes the royal road to comprehension… raising the question: tool or toy?" (Bolz, 2008:141).

Based on the above, it could be argued that the concepts being examined - transparency/opacity, user-friendliness/familiarity, the playful dimension of the medium, and the parallel use of older and newer technologies - are interrelated terms that can frame and influence an educational process. These concepts constantly interact with one another and produce outcomes that arise both from the understanding and the mere use of media. The decisive factor that determines the degree of influence of either condition is the user's personal formation and their relationship with technology. At the same time, this fluctuation also influences and transforms the nature of the media themselves, rendering them either "hot or cool", according to the definition introduced by McLuhan. He argues that "a hot medium is one that extends one single sense in high definition, offering a wealth of data and thus requiring low participation from the receiver/user, whereas a cool medium is low in definition and demands high participation and completion by the receiver/user" (McLuhan, 1990:43). The outcomes generated by this fluctuation and the combined use of media could perhaps be paralleled with the concept and function of a hypertext - "a continuously shifting and ever-enriched form of writing in perpetuity" (Bolz, 2008:132). The case study that follows proposes the development of a hands-on activity as an educational practice for photography and seeks to explore the above questions and concerns.

CASE STUDY

METHODOLOGY

The methodology of the hands-on activity combines elements of transformative learning, "incidental learning", and research from visual scholars such as Gillian Rose. In "Visual Methodologies" (Rose, 2016), Rose develops a broad approach to contemporary visual research methods that promote the close examination of images and explore the full range of relationships embedded within the research framework, as well as the processes involved in the creation and production of images. Among these methods are photo-documentation and photo-elicitation, both of which use photographs as analytical data.

The hands-on activity developed by combining elements of these two methods was addressed to participants with a background in photography, mainly photography students of all academic levels, including students from the Erasmus program of the Department of Photography and Audiovisual Arts at the University of West Attica. The way in which the two methods were combined was creative and is analyzed below.

Initially, images were produced following a photo-documentation practice. For their production, a staged portrait photography approach was used in a studio setting through the construction of an installation (camera obscura) that represented the internal mechanisms of a camera and was the size of a small room. In addition to the creation and later exhibition of the images, data were collected via a questionnaire. This practice corresponds to a photo-elicitation method, which reveals the subjectivities of the participants. This is achieved by highlighting the students' experience through the use, understanding, and observation of the activity's key points, as well as through the collaboration between all participants - educators and learners.

The overall process aimed to produce outcomes on both a cognitive and a metacognitive level; therefore, in addition to the activity itself, the feedback obtained through the questionnaire distributed to the participants also had an impact on both levels. On the cognitive level, the goal was for participants to be able to describe the operating principle of the camera obscura and apply it in the creation of photographs. This process contributes, among other things, to the development of academic competencies - both in terms of understanding the technological aspects of an artwork - knowledge that is essential for the documentation of exhibition objects as typically presented in galleries and museums, databases, and websites - and in terms of the ritual dimension embedded in photographic practices, which often accompanies each technological shift.

At a metacognitive level, the activity aimed to foster critical reflection on contemporary mass photographic production and its integration into all aspects of everyday life. It should also be noted that at the conclusion of the activity, the images were exhibited in the same space, and their presentation contributed to a meta-reading of the images, which also carried a playful character. As such, the activity may provoke a broader shift in the ways images are approached, potentially challenging the "inevitability" of mass photographic production, as it has been articulated from the modernist period to its contemporary digital culmination. At the same time, the activity can serve as a point of reference and a source of inspiration for the creation of artistic work, or more precisely, for the integration of similar techniques both in the staging of the medium and in the identity of the work, so as to address or incorporate the dimension, connection, and interaction between the two technologies. Scholars of contemporary artistic photography, such as Charlotte Cotton, have analyzed examples of photographic artworks that are engaged with analog photography. In her chapter titled "Physical and Material", Cotton outlines how artists embed their relationship with analog photography, thereby highlighting the critical dimension of their work. As she notes, one of the recurring features of these artistic approaches is that they are “divorced from our day-to-day experiences of the medium” (Cotton, 2020: 299).

The influence of artists who use techniques of analog technology for educational practices, as well as the highlighting of the relationship between analog and digital technology within contemporary environments of image circulation, also contributed to the implementation of the activity. It should also be noted that the contemporary trend of institutions – primarily museums – aiming to create more spectacular exhibitions or holistic experiences through installations, similarly supports corresponding educational programs. Notable examples of influential artists are Abelardo Morell and Vera Lutter.

Abelardo Morell is a photographer widely known for his techniques and inverted depictions of the visible world. In an interview with Elizabeth Siegel, he mentions that his first attempts were made in 1980, when he transformed the classroom into a camera obscura in order to teach his students the photographic medium "with the aid of some magic" (Siegel, 2020).

Vera Lutter is a visual artist who uses large-scale camera obscura, creating images that differ from those of a conventional camera, which become unique because they cannot be reproduced. In her recent exhibition titled "Vera Lutter, Spectacular. An exploration of light", held from October 2024 to January 2025, curated by Francesco Zanot at the MAST gallery, a darkroom was set up, and her technique was utilized in educational activities for children (Vera Lutter, Spectacular. An exploration of light).

In the example of Heath Creel - a photographer, poet, and teacher belonging to the generation that grew up with new media such as mobile phones and Instagram, points of convergence between technologies are highlighted. Creel mentions that the roots of his engagement with artistic photography were the historical photographers William Eggleston and Lee Friedlander, whom he first noticed through social media, with the culmination of their influence coming through their photographic books. For Creel, photobooks represented a poetic vision and (as he states) showed that photographs have a way of transforming "cold space into a wholly-human world". Since then, through digital technology, he developed an intimate relationship with the camera, and as he moved towards analog technology, he "was shocked" by the ease with which he understood the process of analog photography (Duyao, 2023). Through Creel's example, W. J. T. Mitchell's assertion is illustrated, that every emerging technology encapsulates or condenses in some way the previous one, which was an additional reason for designing and implementing the hands-on activity based on the combination of analog and digital photographic technologies (Mitchell, 2006: 215).

DESCRIPTION

The hands-on activity "Alice in the Land of Photography 4" was carried out on June 21 and 22, 2024, with the activity concluding on June 26 with the exhibition of the photographs. The entire project was implemented at the photography space “YπOψH” and aimed to address and explore the research questions that were posed. The activity was carried out by: Dimitris Mastorakos, Eva Darara, and Pavlos Satoglou.

For the implementation of the activity, a life-sized darkroom (camera obscura) construction was created, simulating the layout of the interior of a camera. It had a lens and a variable focal plane made of frosted glass, while the lighting conditions in front of the lens allowed for differentiation and experimentation (image 1).

The activity was developed gradually: initially, participants could enter the interior of the structure to observe, experiment, and photograph with a digital camera the reflection of a subject outside the camera obscura (Image 2). Then, the images were extracted to a computer, and simultaneous feedback was provided through a questionnaire, designed to

include the evaluation of the activity and its impact on all the participants. Finally, the participants' portraits were printed, displayed, and exhibited in the space (image 3).

METHODOLOGY AND STRUCTURE OF THE QUESTIONNAIRE

The questionnaire was structured by taking into account characteristics of qualitative methods, aiming to draw conclusions based on the cognitive and metacognitive levels targeted by the process. As mentioned earlier, the participants were related to photography or were photography students; therefore, the sampling can be considered as purposive sampling. The role of the questionnaire was not one-sided, so it was useful not only for the researcher but also, to some extent, for extending the experience of the participants in the activity - stimulating reflection, positioning concepts, and bridging theory and practice. One of its characteristics is the multiple possible answers, using methods like POE - post-occupancy evaluation - with a non-directive approach, interlinked questions, and predefined possible answers. Although POE methods are typically used for users of permanent building facilities to evaluate spaces, it was deemed appropriate to employ this characteristic in the present research, as it involves the space of an installation and the comfort of its users, for their familiarization with it and the final implementation of the activity.

Images 3,4.
Portraits
The first photograph is by Anastasia Vlachaki, while the double portrait was taken by Eva Darara

The questionnaire was structured into four parts, aiming to gather results in relation to: a. the characteristics of the participants, b. the evaluation of the activity, c. the extension of the experience and cognitive function, d. the focus on the comparison with characteristics of contemporary digital photography and the current circulation of photography through social networks.

QUESTIONNAIRE RESULTS

The comparative results are provided based on the aforementioned structure, and the questionnaire is presented in the following section:

a. The workshop was attended by twenty participants with an average age of thirty-five years, and an age range from 19 to 62 years. The majority of them use a mobile phone or a digital camera, while 1 in 4 uses an analog camera. The characteristics of the participants are derived from questions 1 and 2, showing that there was a diversity of ages, which means that a variety of experiences and perspectives were ensured within the framework of the defined sampling.

b. The responses resulting from questions 3, 4, 5, and 6 show that: 90% of the participants experienced the activity as a new and interesting experience (question 3). The overall process was considered the biggest surprise and was accepted by 80% of the participants, while the technical aspect had less of an impact: the camera obscura was noticed by 30%, and the inverted image by 10%. The question allowed for an additional response, and one participant made the following interesting observation: " The experience of waiting for the focusing process brings you back to the present moment" (question 4). The vast majority - 95% - were positively inclined and agreed that they would experiment with a similar setup or would most likely try it (question 5). Furthermore, 79% felt comfortable with the time available during the camera obscura installation (question 6).

c. The next three questions, 7, 8, and 9, focused on the details of the technical aspects of the process, such as the elements of the camera obscura, posing, the appearance of the inverted image on the frosted glass, its display in the camera, and how the image was projected or printed. This part of the questionnaire, among other things, aimed to expand the experience and act cognitively in relation to the technical terminology of an obsolete technology, in the direction of its creative interaction with new technologies. As already mentioned, it also sought to offer a meta-reading through the exhibition of the images.

The results drawn from questions 7, 8, and 9 indicate that: 84% preferred active participation over passive observation, as they chose experimentation or a combination of experimentation and photographing, in contrast to engaging exclusively in photographing, which received only 16% (question 7). Additionally, 72% felt at least somewhat comfortable with posing, but there is also a significant percentage of 28% who felt awkward (question 8). The next question brought about divided opinion thus no crucial conclusions can be drawn. Half of them replied that there are significant differences between how the image is captured on the frosted glass, in the camera, and how it was projected or printed, while the other 50% replied that there were no notable differences. Consequently, this ambiguous results should be examined as a flaw either in the process itself and the sequence of stages or in the question itself and its level of understanding (question 9).

d. The next two questions, 10 and 11, focused on comparing the process with the selfie and the need for communication and the contemporary circulation of photography through social networks. The results show that 78% of participants consider the use of the camera obscura a different experience compared to the selfie (question 10), and the same percentage desires social visibility for the images they produced (question 11).

Finally, regarding the question 12 - We have named the activity “Alice in the Land of Photography”. Would you like to suggest a different title? -, being irrelevant to the previous categories, the following answers were recorded: Magic Lantern, Dark Vanet, Something more related to a camera maybe, Going back to a different century, Room Obscura, In her own world, Inverted images: photographic captures in a darkroom, A journey to the past with the mind in the present, Alice in the darkroom. Last but not least, one person wrote that the title was perfect, while two other responders stated that they would not suggest a different title.

QUESTIONNAIRE

1. How old are you?

2 What type of camera do you use? (multiple replies possible)
a Mobile b. Digital camera c. Analog camera d. Other e. I don't use a camera

3. What did you think of the activity? Was it a new experience compared to photography?
a. Yes b. Quite interesting c. No, it's a familiar process to me d. I was indifferent

4. If the process was interesting or familiar, what in your opinion was the biggest surprise? (multiple replies possible)
a. The whole process b. The inverted image c. Digital download d. Viewing/printing e. The camera obscura
f. The total exposure of portraits g. Other (insert your reply)

5. Would you make or experiment with a similar camera obscura in your room or somewhere else?
a. Yes b. Possible c. No

6. Was the time you spent inside of the camera obscura enough?
a. Yes b. No

7. Did you want to photograph or experiment with the inverted image of camera obscura?
a. Photograph it b. Experiment c. Both d. Neither

8. Did you feel comfortable posing for a photo?
a. Very b. Enough c. A little d. Not at all

9. Do you think there are differences between how the image is recorded on the frosted glass, the camera and how it was projected/printed?
a. Yes, several differences b. No c. Not special

10. Do you think that taking pictures with a camera obscura is similar to taking selfies?
a. Yes, it looks very similar b. No differs

11. Do you feel the need to upload photos or videos of the activity on social media?
a. Yes, enough b. No c. Not particularly

12. We have named the activity "Alice in the land of photography". Would you like to propose a different title?

CONCLUSIONS

The majority evaluated the activity positively, demonstrating that the role of education through hands-on activities has the potential to modify users' behavior towards a medium, as Bolz notes (2008). Specifically, the opportunity for participants to enter the interior of the construction (camera obscura) and explore it, to become familiar with it, fostered a sense of intimacy and user-friendliness towards the installation. At the same time, it revealed participants' understanding and ability to distinguish between different practices that characterize contemporary media, such as the selfie. Despite the small number of participants, the results were significant - consequently, the questionnaire functioned as a pilot tool for similar activities. Possible new adaptations or revisions to the questionnaire, based on the results and observations derived, could improve future activities.

The conclusions that emerged should be viewed and assessed within the constantly evolving contemporary media environment - that of the "new orality"- which is currently unfolding and which, as Ong notes, "... is a more deliberate and self-conscious orality, based on the use of writing and print, both of which are essential for the construction, operation, and use of machinery" (Ong, 2015: 193–195).

The characteristics of this "new orality", along with technological innovations in the field of media - most recently that of artificial intelligence - correspond to a different type of writing and communication: that of the hypertext. Regarding this multilayered form of writing, Bolz observes that "...whether we are referring to hypertext (the electronic space of writing) or to multimedia, it is always a communicative offering that combines the sensory richness of television, the informational depth of print media, and the interactive capacity of the networked computer. Images, in particular, are gaining increasing importance, as they are faster, more concise, and more complex than language... Text can no longer keep up with the acceleration of our world" (Bolz, 2008:132).

Within this complex multimedia environment, which constantly interacts with both the user and its constituent elements - such as sound, image, and text - an obsolete technology, in combination with new media, may function as a site of denotation, contributing to the understanding of digital technology and, more broadly, to the educational process. The combined use of analog and digital technologies, which also integrates the playful dimension of the medium, has emerged as a valuable educational tool.

e-mail: isiguna@yahoo.gr

ABSTRACT

The study examines learning as an active and dynamic process, in which students acquire knowledge through personal involvement and interaction with their environment, as well as with tools that support thinking and communication. It presents key theoretical approaches such as constructivism, which emphasizes the importance of experience and social interaction in the learning process, and activity theory, which views learning as a collective process shaped by social and cultural structures. Particular emphasis is placed on visual literacy, as images play a central role in modern communication, requiring students to develop skills in analyzing and creating visual content. Furthermore, the study highlights the transformative role of technology in the learning process, with the integration of Web 2.0 tools and the use of Bloom's digital taxonomy for developing higher-order thinking skills. Finally, it underlines the importance of pedagogical integration of digital media and the continuous professional development of educators, in order to provide learning experiences tailored to the needs and demands of the 21st century.abstract should include the focus of your paper, i.e., what your paper is about, a brief description of the steps or methodology used, the main findings of the paper, and its results.

Keywords: digital Media, pedagogical theories, learning.

LEARNING: AN ACTIVE PROCESS

The science of pedagogy has always sought methods for more effective knowledge transmission to students. In this pursuit, various theories have been developed to support this aim. Vygotsky, with his innovative ideas on learning and development, has had a significant influence on the Western world in recent decades, as educational interest shifted toward the communicative and cultural dimensions of learning (Raptis & Rapti, 2007).

Thus, in the early 20th century, the theory of constructivism emerged, focusing on the individual's personal involvement and capabilities during the educational process, rather than placing emphasis solely on teaching tools. The evolution of technology played a decisive role in the dissemination of this theory. Constructivism views learning as a dynamic and active process in which knowledge is acquired through experiences and real-world applications. This means that education is not confined to the four walls of the classroom but extends to various contexts, promoting critical thinking and flexibility in the application of knowledge. Students are encouraged to examine information from different perspectives, interact, and compare diverse viewpoints in order to achieve a more comprehensive understanding.

According to the constructivist theory, it is essential to create authentic and realistic learning environments that promote exploratory and open-ended learning instead of simply transmitting predetermined knowledge. It must be taken into account that reality is not absolute but a product of human perception and experience (Kanakis, 2011).

Vygotsky emphasized the importance of the sociocultural dimension of learning, arguing that cognitive development is inextricably linked to the cultural and social environment in which it occurs. An individual's progress does not depend solely on innate abilities but is influenced by interactions with the environment, social events, and the cultural tools that surround them (Raptis & Rapti, 2007). Of particular importance is mediation through tools that reflect the cultural and historical context of each society, as well as the educational practices that are adopted (Komis, 2015).

According to Vygotsky's theory, language is the primary sociocultural tool through which a child shapes their thinking and develops their identity within their community. Based on this idea, he introduced the concept of the Zone of Proximal Development (ZPD), which describes the difference between what a child can achieve independently and what they can accomplish with guidance and interaction with their environment (Raptis & Rapti, 2007). This theory is of critical importance for educational practice, as it underscores the need to adapt teaching to students' needs and capabilities.

In addition to the social environment, technology can also play a crucial role in the learning process, providing students with opportunities for active participation, critical thinking, and knowledge discovery. Digital technologies have already been integrated into many educational structures, shaping a new educational landscape that enhances learning through innovative methods (Smyrnaiou & Koutsidou, 2014). Technology can offer interactive learning environments, personalized tools, and access to a wealth of information, thereby contributing to the improvement of the educational experience and the development of essential 21st-century skills.

ACTIVITY THEORY

Activity Theory, as developed by Vygotsky, Leontiev, and Engeström, proposes an interpretive approach in which individuals' actions are examined within the context of a broader system, defined as an *activity* (Cong-Lem, 2022). The individual components of an activity form a complex system that functions as a dynamic learning model. This model includes the subject, the object, the goal, the tools, the individual actions and operations that influence the final outcome, as well as the social parameters such as rules, community, and division of labor (Komis, 2015).

Activity is considered a set of human actions and interactions that take place within both a physical and social environment. Within this context, individuals communicate, collaborate, and evolve through processes shaped by cultural and social factors. This interaction involves both interpersonal relationships and the use of material tools, linguistic symbols, and cultural elements, all of which contribute to the construction of knowledge. Conceptual change is achieved through socio-cognitive conflict and cognitive restructuring, which lead to the process of didactic transformation.

Participation in an activity involves performing specific actions within a defined framework, aimed at achieving a particular goal. This goal is accomplished through the use of mediating tools, methods, symbols, materials, procedures, and roles that define the interaction among participants (Komis, 2004).

The activity system consists of two fundamental elements: the subject and the object. The *subject* refers to the individual or group participating in the activity, while the *object* corresponds to the goal of the activity, defining both its

initiation and its completion. The tools used within the framework of an activity can be either material (such as computers and other technological devices) or cognitive (such as reasoning, discovery, and logical processing of information).

Furthermore, in contrast to traditional cognitive psychology—which focuses primarily on mental representations—activity theory places special emphasis on the significance of socially determined tools and symbols. The use of these elements not only shapes the way individuals think and act but also influences their broader educational and professional development through processes of interaction and collaboration (Komis, 2015).

THE UTILIZATION OF VISUAL LITERACY IN THE EDUCATIONAL PROCESS

In the modern western world, people of all ages are constantly exposed to a multitude of images, which they later integrate into their thinking and actions. Young people in particular choose visual media as a primary source of entertainment, making use of it in various forms such as cinema, video games, and mobile applications. This increasing engagement requires the development of visual literacy skills in order to understand, interpret, and evaluate the visual messages they encounter daily.

Today's society does not merely involve the passive reception of information; it demands that its citizens be capable of analyzing and decoding visual stimuli, attributing meaning and context to them. The modern citizen is expected to manage visual content with ease, a skill that constitutes a fundamental aspect of digital literacy. In a world where images tend to dominate over traditional written language, individuals of all ages—children, adolescents, and adults—spend a large part of their time exposed to a flood of audiovisual messages through television, the internet, advertisements, and various print and digital media. Nevertheless, "the gaze of the young viewer is saturated with images, yet untrained" (Grosdos, 2008).

Education plays a crucial role in the development of visual literacy, as appropriate knowledge and skills must be provided from the early stages of school life. These will enable students to become active and conscious producers and consumers of visual messages. The increasing importance of the image as a means of communication is linked to both economic developments and technological advances, which have significantly affected the way people communicate (Grosdos, 2008).

Regan (2008) highlights the importance of visual literacy, emphasizing that educators should develop strategies that encourage students to participate in activities promoting visualization, such as the creation of digital storytelling. The modern educational process should not only encourage students to receive and analyze images but also to use them creatively. In the classroom, students are not passive recipients of visual messages; they are taught to interpret, discuss, and communicate them with their peers. Furthermore, they are encouraged to produce their own images and other audiovisual media, actively participating in the creation of meaning and the exchange of information through visual language (Sadik, 2008; Vasilikopoulou, 2011).

TECHNOLOGY AS A TOOL IN EDUCATION

The rapid advancement of technology has brought about significant changes in the field of education, affecting both teachers and students. Modern technological capabilities have expanded and enriched teaching methods, radically transforming the educational environment. However, the educational system itself often struggles to adapt to these new conditions, failing to effectively integrate technological innovations into the learning process.

Younger generations of students are familiar with technology and can utilize digital media at all levels of education (Prensky, 2001). In the 21st century, skills that enhance digital, visual, and technological literacy are required, making the integration of technology into educational programs essential. Although traditional education mainly relies on printed materials, today's students must become familiar with technology by using e-books, emails, online information, and computer-based presentations (Brown, Bryan & Brown, 2005).

According to Koutsopoulos and Economou, the modern school must promote flexibility, collaboration, and equality of access to educational opportunities by shaping a technology-based environment (Koutsopoulos & Economou, 2015). At the same time, technology plays a crucial role in promoting equity, contributing to shaping students' futures (Forzani & Leu, 2012).

The use of technology as a tool to enhance student literacy has been the focus of many researchers. The 21st century demands innovative teaching approaches that incorporate technological possibilities, supporting the development

of digital literacy. Some argue that technology radically transforms literacy, while others claim it serves as a means of renewing and strengthening existing cognitive concepts (Brown, Bryan & Brown, 2005).

Glister (1997) defines digital literacy as the ability of an individual to communicate effectively in an ever-changing society by searching for and utilizing information. It is a process that involves reading, exchanging, evaluating, and synthesizing information, while encompassing different forms of literacy, such as technological, visual, and informational (Kafetzis, 2010).

In today's educational reality, students are no longer limited to traditional peer interactions, but use technological tools to communicate, search for information, and create multimedia content. Through technology, they gain the ability to process and reshape information using both linear and visual media (Kafetzis, 2010).

Bloom's taxonomy (1956) describes cognitive development and the higher mental processes related to learning. With its revised version by Anderson & Krathwohl (2001) and the modern integration of technology, the theory can be applied to digital learning, enabling more interactive and personalized educational experiences. Technology influences every level of Bloom's taxonomy:

Knowledge (Remembering): Tools such as search engines, digital dictionaries, and interactive quizzes help students quickly acquire and recall information.

Understanding: Interactive videos, podcasts, and explanatory apps allow for a deeper understanding of concepts.

Applying: Simulations, virtual labs, and programming tools enable hands-on practice in real-world scenarios.

Analyzing: Data analysis software and concept mapping applications allow students to identify relationships between pieces of information.

Evaluating: Online discussions, blogs, and critical analyses provide opportunities for students to form and defend opinions.

Creating: Content creation tools (such as design software, digital writing platforms, and programming) support the development of original work.

Moreover, Paivio's dual coding theory and Mayer's cognitive theory of multimedia learning highlight the importance of combining images and words in the learning process. Information introduced through different cognitive channels (visual and verbal) enhances comprehension and facilitates knowledge transfer to long-term memory, contributing to more effective problem-solving (Paivio, 2006; Bereiter & Scardamalia, 2014).

The development of Web 2.0 and its integration into education can facilitate student content creation by offering opportunities that would not be possible through traditional, non-digital, or offline tools. The term *Web 2.0* refers to a range of online applications and environments characterized by open access and interactivity. Unlike static web pages, users are not limited to passive consumption of information—they actively participate by commenting, creating their own pages, and generating new content. At the same time, they contribute to the collective evaluation of available digital material, enhancing collaborative learning and knowledge exchange. The use of ICT and online tools can significantly contribute to collaborative learning, the development of communication skills, and the cultivation of a lifelong learning culture (Tzimogiannis, 2007).

RECOMMENDATIONS / CONCLUSIONS

Curriculum

The integration of digital media into curricula requires a rethinking of how we perceive teaching and learning. It is not merely about adding new tools, but rather about a philosophical shift that acknowledges the importance of digital technology in students' development. New curricula should incorporate digital skills, as students must develop competencies such as searching for, evaluating, and using digital information, as well as creating digital content. Digital media can facilitate collaboration among students and between students and teachers, supporting cooperative learning. Digital technology can be adapted to the needs and interests of each student, offering personalized learning experiences, thus promoting individualized learning. Furthermore, digital media encourage creativity and innovation, and can be used to generate original content, develop new ideas, and solve problems in creative ways (Karipidis, 2013).

Digital Media

The selection of digital media for teaching practices should be based on specific pedagogical criteria. Digital tools should be: a) of high quality, with accurate and reliable content that meets students' needs, b) interactive, to promote active student participation in the learning process, c) accessible, d) flexible enough to be used in various contexts and for different purposes (Sofos, 2015).

Pedagogical Integration

The pedagogical integration of digital media into teaching practices requires educators to develop new skills and adopt new teaching approaches. Teachers must be able to effectively use digital tools to support student learning. They should be capable of creating digital content that is relevant to their subjects and meets the needs of their students. Additionally, teachers must be able to evaluate the effectiveness of the digital media they use in their teaching (Tzimogiannis, 2007; Kanakis, 2011).

The pedagogical integration of digital media presents both a challenge and an opportunity for the improvement of education. With appropriate support and guidance, teachers can harness the potential of digital technology to create a more effective and engaging learning environment for their students.

ABSTRACT

The pedagogical integration of digital media into teaching practice refers to the use of technologies and digital tools to support and enhance teaching and learning. These media offer new opportunities for educators and students, enabling them to interact with the content in innovative and engaging ways.

Modern curricula, grounded in contemporary learning theories, increasingly incorporate digital media into the teaching of both STEM and Humanities subjects. This integration promotes active engagement and fosters a deeper, more comprehensive understanding of new knowledge.

In remote schools located in mountainous areas, such as the General Lyceum of P. Diasello in Arta, the challenge is greater. Although the school is technologically equipped—with interactive touchscreens and a fully independent IT lab—connectivity remains low or even non-existent. Despite this limitation, educators strive daily to integrate as many digital tools as possible into their teaching. The aim is to make learning more engaging and participatory, aligning with the framework set by the United Nations' Goal 4: Quality Education.

Indicative digital tools used include: Mentimeter, Mozabook, Storybird, Google Forms, Canva, and Kahoot. By interacting with these tools, students enhance their active participation in enjoyable ways, collaborate in teams, achieve a holistic understanding of new knowledge, and become able to transfer what they've learned to other learning environments. In this way, education becomes of higher quality for both students and teachers.

In conclusion, in a constantly evolving world, education must rise to its role—especially in semi-mountainous schools, which are tasked with bridging both learning and technological gaps for the new generation of students. This endeavor represents a powerful strategy for ongoing education, yet it requires a coordinated approach to overcome challenges and fully harness the potential of digital learning.

Keywords: digital tools, learning theories, quality education, STEM, Humanities

INTRODUCTION

The rapid development of digital technologies has profoundly influenced educational systems worldwide, reshaping teaching practices and learning environments. In secondary education, the integration of Information and Communication Technologies (ICT) is increasingly associated with learner-centered approaches, active participation, and the development of higher-order cognitive skills. However, the effective pedagogical integration of digital tools remains a complex and context-dependent process, particularly in schools located in remote or underserved areas.

The object of the present study is the systematic investigation of the pedagogical integration of digital tools in a remote secondary school and its contribution to the learning process. The paper seeks to describe and analyze how digital tools, when embedded within a coherent pedagogical framework, can support meaningful learning experiences even in conditions of limited connectivity and technological infrastructure.

From a theoretical perspective, the integration of digital tools is closely linked to constructivist and sociocultural theories of learning. Constructivism emphasizes that learners actively construct knowledge through engagement in authentic learning activities (Bruner, 1996), while sociocultural theory highlights the mediating role of tools and social interaction in cognitive development (Vygotsky, 1978). Digital tools function as mediational means that facilitate collaboration, exploration, and reflective learning.

Despite persistent challenges such as digital inequality and limited access to technological resources, international research suggests that pedagogically grounded digital practices can contribute to reducing educational disparities and enhancing learning quality (OECD, 2015; European Commission, 2020). This study contributes to the existing literature by providing empirical evidence from a real-life educational context characterized by geographical isolation and infrastructural constraints.

PURPOSE OF THE STUDY

The purpose of this study is to provide a scientific description and qualitative analysis of the pedagogical use of digital tools in secondary education through a case study of the General Upper Secondary School of P. Diasello in Arta, Greece.

More specifically, the study aims to: examine how digital tools are integrated into everyday teaching practices in small-sized classes, explore their impact on student engagement, participation, and understanding, identify pedagogical benefits and challenges associated with digital learning in a remote school context, and assess the extent to which such practices align with international educational goals, particularly the United Nations Sustainable Development Goal 4 on Quality Education (UNESCO, 2017).

METHODOLOGY

The study adopts a qualitative research design based on the case study methodology, which is particularly suitable for the in-depth exploration of complex educational phenomena within their real-life contexts (Yin, 2018).

The research setting is the General Upper Secondary School of P. Diasello, located in a semi-mountainous and remote area of the region of Arta. The school operates under conditions of limited or unstable internet connectivity, although it is equipped with basic digital infrastructure, such as interactive software and standalone digital devices.

The participants include students from the 10th, 11th, and 12th grades, organized into small-sized classes of five to six students. Data collection was carried out through: systematic pedagogical observation during classroom instruction, reflective notes maintained by the teacher-researcher, and qualitative analysis of students' assignments and digital artifacts.

A range of digital tools was employed during instruction, including Mentimeter, Mozabook, Storybird, Google Forms, Canva, and Kahoot. These tools were selected based on their pedagogical affordances, flexibility, and feasibility of use in environments with limited connectivity.

DISCUSSION

The analysis of the collected data indicates that the pedagogically informed integration of digital tools positively influenced students' learning experiences. Consistent with international research findings, technology enhanced student

participation and understanding when embedded within a clearly articulated pedagogical framework (OECD, 2015; European Commission, 2020).

Mentimeter facilitated interaction and formative assessment by enabling anonymous student responses, thus reducing performance anxiety and encouraging broader participation. Mozabook supported the visualization of complex scientific concepts through simulations and interactive representations, reinforcing active knowledge construction (Bruner, 1996).

In humanities subjects, Storybird promoted creative expression and experiential learning, while Canva enhanced the visual organization and presentation of information, supporting collaborative learning practices. Google Forms proved effective for both formative and summative assessment, providing immediate feedback and enabling instructional adjustments. Kahoot introduced elements of gamification, increasing motivation and engagement, particularly among students with lower initial participation levels.

Overall, the findings underscore the central role of the teacher as a designer of learning experiences and as a mediator between technology and pedagogy, especially in contexts characterized by limited resources.

CONCLUSIONS

The present study demonstrates that the pedagogical integration of digital tools can meaningfully support quality education in remote secondary school settings. When aligned with contemporary learning theories and adapted to local conditions, digital tools enhance active participation, collaboration, and meaningful learning.

Nevertheless, the sustainable implementation of digital learning requires systematic institutional support, including investment in technological infrastructure and continuous professional development for teachers. Future research could extend the findings through comparative studies across different remote educational contexts.

ABSTRACT

This paper presents the experience from the implementation of an Action Plan titled "Music Technology in the Educational Process: Discovering Productivity through Recording", which was applied at the Music School of Amfissa during the 2024-2025 school year, within the framework of the Internal School Evaluation by the Institute of Educational Policy (IEP). The main goal of the Action Plan was to enhance students' music education through the innovative use of music technology and recording, supported by the ESPA program "Upgrade of Music Education in Music Schools" (2023-2026). Specific objectives included developing students' technical skills in recording and sound editing, fostering creativity through the production of musical works, and understanding the importance of technology in the professional music field. Implementation involves organized workshops on recording and music production, utilizing modern equipment and digital software (Cubase, Audacity, Dorico, MuseScore). The program was applied gradually, with students creating group musical projects and taking an active role in all production stages. The evaluation methodology focused mainly on a qualitative approach (interviews, observation, analysis of works). The Action Plan directly contributed to the more effective implementation of cultural programs. Key challenges involved managing resources, ensuring student engagement, and supporting teachers. The paper concludes by highlighting the prospects for the sustainable use of digital technologies in Music Schools based on the findings of this completed study.

Keywords: Digital Technologies, Music Education, Creativity, Cultural Programs, Greek Music School

INTRODUCTION

The contemporary educational landscape is characterized by the ever-increasing penetration of digital technologies, which are redefining teaching and learning methods. This digital transformation is not merely a trend but a fundamental shift that affects all levels and disciplines of education, including the arts. In the field of music education, technology has evolved from a simple auxiliary tool to a powerful catalyst for developing new skills, enhancing creativity, and bridging the gap between school-based knowledge and contemporary professional music practices. This evolution is crucial for music schools, which aim to provide a comprehensive education that is both artistically enriching and relevant to the demands of the 21st century.

This paper presents the experience from the application of the Action Plan "Music Technology in the Educational Process: Discovering Productivity through Recording." This initiative is being implemented at the Music School of Amfissa "Eleni Karaindrou" during the 2024-2025 school year, as part of the Internal School Unit Evaluation framework of the Institute of Educational Policy (IEP) and is supported by resources from the ESPA program "Upgrade of Music Education in Music Schools" (2023-2026). The project's core objective was to move beyond the superficial use of technology, aiming instead to cultivate students' digital literacy and integrate pedagogical practices that promote active participation, collaborative creation, and meaningful artistic expression (Redecker & Punie, 2017). Through this Action Plan, we explored the challenges, opportunities, and broader implications of embedding advanced music technology within the unique ecosystem of a Greek Music School.

THEORETICAL FRAMEWORK

The integration of music technology in education is a multifaceted process that is best understood through a combination of pedagogical and technological theories. The theoretical underpinnings of this Action Plan draw from established frameworks that emphasize active, student-centered, and technology-enhanced learning.

Project-Based Learning (PBL) and Constructivism

At its core, the Action Plan is aligned with the principles of Project-Based Learning (PBL), a constructivist approach where students gain knowledge and skills by working for an extended period to investigate and respond to an authentic, engaging, and complex question, problem, or challenge (Bell, 2010). In our context, the "project" was the creation of a complete musical piece, from arrangement and recording to final production. This process encourages students to take ownership of their learning, fostering autonomy, critical thinking, and collaboration (Condliffe et al., 2017). By engaging in a meaningful, real-world task, students are not just passive recipients of information but active constructors of their own musical and technical understanding, a central tenet of Papert's (1980) constructionism.

TPACK and the role of cognitive tools

The effective integration of technology in the classroom requires more than just technical proficiency. The Technological Pedagogical Content Knowledge (TPACK) framework posits that meaningful technology integration lies at the intersection of three core knowledge domains: Technological Knowledge (TK), Pedagogical Knowledge (PK), and Content Knowledge (CK) (Mishra & Koehler, 2006). In our project:

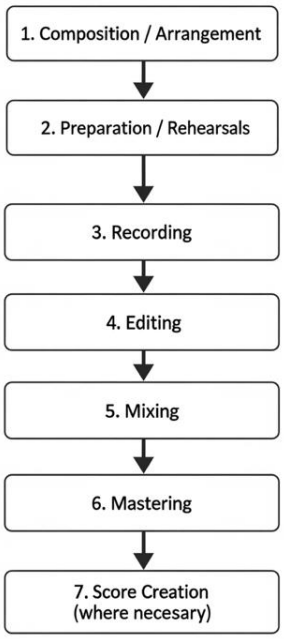
- **Content knowledge (CK)** is the deep understanding of music theory, performance, and history.
- **Pedagogical knowledge (PK)** involves the strategies for student-centered learning, such as PBL and collaborative group work.
- **Technological knowledge (TK)** is the proficiency with the hardware and software used (DAWs, notation programs, etc.).

The goal was to operate at the nexus of these three, where technology is used in a pedagogically sound way to teach musical content. Tools like Digital Audio Workstations (DAWs) and notation software function as "cognitive tools" (Ruthmann & Tobias, 2017). They offload lower-level cognitive tasks (e.g., manual transcription of a score) and allow students to focus on higher-order processes such as creative decision-making, harmonic exploration, and sonic experimentation, thereby amplifying their musicality (King & Himonides, 2016).

IMPLEMENTATION METHODOLOGY OF THE ACTION PLAN

The Action Plan was structured as a year-long intervention at the Music School of Amfissa. The methodology was designed to be both systematic and flexible, allowing for adaptation based on student progress and emerging needs.

Target group and setting



The primary target group consisted of the students participating in the "Greek Traditional Music" Club, which operates under the coordination of one of the authors. This specific group was chosen for two main reasons: firstly, it provided a stable and consistent cohort for the duration of the project, facilitating systematic monitoring. Secondly, it offered a unique opportunity to explore the fusion of traditional music idioms with modern production technologies, a central theme of the project.

Implementation stages

The project was implemented through a phased approach, ensuring a gradual and scaffolded learning experience:

1. **Initial phase: Foundational skills & familiarization:** The first stage focused on introducing students to the basic equipment and software. This included hands-on sessions covering signal flow (from microphone to computer), the functions of audio interfaces and mixing consoles, and the fundamental features of the software tools: Cubase and Audacity for audio recording and editing, and Dorico and MuseScore for music notation.
2. **Theoretical training: Structured workshops:** A series of workshops provided the necessary theoretical background. Topics were presented in a digestible format and include principles of acoustics, microphone types and placement techniques, an introduction to sound processing (equalization, compression, reverb), and the essentials of digital music notation.
3. **Practical practice: Applied scenarios:** Students applied their theoretical knowledge in structured, hands-on activities. Working both individually and in small, collaborative groups, they tackle specific tasks such as recording a single vocal or instrument track, creating simple rhythmic loops using MIDI, or editing pre-recorded audio files to correct timing and pitch issues.
4. **Group project production: The core creative phase:** This was the culminating stage where students worked as a production team. Divided into small groups, they took on the entire process of creating a musical piece.

Diagram 1
Flowchart of the Music Production process in the Club

This includes:

- **Composition/Arrangement:** Deciding on the musical material, whether an original composition or a creative arrangement of a traditional piece.
- **Pre-production:** Planning the recording sessions and rehearsing the material.
- **Recording:** Capturing the performances of all instruments and vocals.
- **Post-production:** This involved detailed editing (compiling the best takes), mixing (balancing the levels, panning, and effects of all tracks), and a basic form of mastering (preparing the final track for distribution).

- **Documentation:** Creating a digital score of their work where applicable.

This methodology combined direct instruction for foundational concepts with a discovery learning approach for creative tasks, empowering students to actively construct their knowledge (Hattie, 2012). The production process is illustrated schematically (Diagram 1).

EVALUATION METHODOLOGY

Due to the small, focused nature of the participant group, a qualitative-dominant evaluation methodology was deemed most appropriate. This approach allowed for a rich, in-depth exploration of the students' experiences, attitudes, and skill development, rather than a purely quantitative measurement. The overall design was that of an embedded single-case study, with the Action Plan as the case (Creswell & Poth, 2018). The evaluation included three phases.

Initial evaluation (baseline)

At the outset of the project, a short, anonymous questionnaire was administered to the students. Its purpose was to establish a baseline by gauging their pre-existing knowledge of music technology, assessing their self-perceived technical skills, and exploring their initial attitudes and expectations regarding the role of technology in music.

Formative evaluation (ongoing)

A continuous evaluation process is employed throughout the school year to monitor progress and allow for real-time adjustments to the teaching strategy. The methods include:

- **Systematic observation:** The coordinating teacher maintained a detailed observation journal, recording student engagement, collaboration within groups, problem-solving approaches, and moments of insight or difficulty during workshops.
- **Informal feedback & dialogue:** Regular, informal conversations with students provided immediate feedback on the clarity of instruction and the difficulty of tasks.
- **Focus groups:** At the end of each major project phase, short focus group discussions were conducted. These were designed to capture collective reflections, identify common challenges, and gather student suggestions for improvement.

Final evaluation (summative)

At the conclusion of the school year, a multi-faceted final evaluation was conducted:

- **Semi-structured interviews:** Individual interviews with each participating student explored their overall experience, the specific skills they believed they had acquired, and any shifts in their attitudes towards music and technology.
- **Artifact analysis:** The final musical works produced by the student groups were analyzed as primary data. The analysis used a rubric with criteria such as technical proficiency (clarity of recording, balance of the mix), creativity (originality of ideas, use of effects), and evidence of collaboration.
- **Triangulation:** To ensure the validity and reliability of the findings, the data from all sources (questionnaires, observation notes, focus groups, interviews, and artifact analysis) were triangulated, allowing for a comprehensive and nuanced understanding of the project's impact (Flick, 2018).

RESULTS AND DISCUSSION

The implementation of the Action Plan yielded significant results, which were analyzed through the qualitive methods described. The findings are grouped into key themes that emerged from the data.

Development of technical and aural skills

Observations and student feedback indicate a clear and steady progression in technical proficiency. Students who initially had no experience with recording software are now able to independently set up a recording chain, operate the basic functions of the DAW, and apply fundamental editing techniques. A particularly notable development was the enhancement of their aural skills. As one student remarked during a focus group, "Before, I just listened to music. Now, I *hear* the different instruments, how the voice is placed, how the reverb makes it sound bigger." This shift from passive

listening to active, analytical hearing is a key outcome, suggesting that the hands-on production process fosters a deeper engagement with the sonic texture of music.

Image 1
Example of a digitally notated score

Enhancement of creativity and engagement

The project-based approach has proven to be a powerful motivator. Student engagement is consistently high, particularly during the collaborative production phases. The immediate feedback loop provided by the technology—the ability to record an idea, listen back instantly, and modify it—appears to significantly fuel the creative process. This was especially evident in their willingness to experiment. For instance, one group spent a considerable time recording sounds from around the school and integrating them into their traditional music arrangement, a creative leap they stated would have been "unimaginable" without the tools to capture and manipulate sound easily.

Understanding the professional dimension of music

A significant shift has been observed in students' perception of music creation. Initially, many viewed music production as a mysterious process confined to professional studios. Through hands-on experience, they have begun to appreciate the complexity, skill, and decision-making involved. This demystification also connected their school activities to the professional music world, providing a clearer view of potential career paths in sound engineering, production, and composition.

Synergies with the broader school culture

The Action Plan has not operated in a vacuum. It has become a resource for the entire school community, particularly in supporting other cultural activities. The skills and equipment of the project were utilized to record the school's annual Christmas concert, providing a high-quality audio document for the school archive. Furthermore, the group collaborated with the theatre club to produce the sound design and original music for the end-of-year play. This demonstrated the project's capacity to act as a central hub of creativity and technical support, enriching the school's cultural life.

Image 2
Example of a DAW project session

Table 1
Examples of Musical Works Produced

Project Title	Student Group	Music Genre	Tools Used
Arrangement of "Ta Deilina" (by G. Zampetas)	Group A (Greek Traditional Music Club)	Laïkó	**Software:** Cubase, Dorico, MuseScore **Hardware:** Microphones, Audio Interface, Mixing Console
Original Composition "Karaindrou Voiyage"	Group B	Cinematic Film Scoring	**Software:** Cubase, Sampled sounds
School Choir Recording	Group C	Choral	**Software:** Audacity **Hardware:** Multiple Microphones, Audio Interface, Mixing Console

CHALLENGES AND COPING STRATEGIES

The implementation of the action was not without challenges, which largely reflect the broader issues of technology integration in schools (Ertmer & Ottenbreit-Leftwich, 2010; Tondeur et al., 2017).

Management of technological resources

The primary challenge was the limited availability of high-specification equipment. With only a few workstations powerful enough to run professional DAWs smoothly and a limited number of audio interfaces, scheduling and access became critical issues.

- **Coping strategy:** A rotation system was implemented, where small groups of students work on different tasks simultaneously. While one group is recording in the main workstation, another might be editing MIDI parts on a less powerful computer, and a third could be working on score notation or planning the next session. This parallel workflow maximized the use of available resources.

Ensuring stable and equitable student engagement

Maintaining consistent engagement from all students, especially when they encounter technical hurdles or creative blocks, was a persistent challenge. There was a risk that students with more prior experience might dominate the process.

- **Coping strategy:** The project incorporated principles of differentiated instruction. Tasks were structured with varying levels of complexity. For instance, within a group, one student might focus on the complex task of editing vocal pitch, while another might work on the more straightforward task of organizing and labeling audio files. The emphasis was on contribution to the collective goal, valuing all roles in the production process.

Need for continuous teacher support and development

The rapid evolution of music technology means that educators must be lifelong learners. Staying current with new software versions, hardware, and production techniques requires a significant investment of time and effort.

- **Coping Strategy:** A key strategy was to foster a small "community of practice" among the interested teachers within the school. Regular, informal meetings to share discoveries, solve technical problems, and discuss pedagogical approaches proved invaluable. This peer-to-peer support system was crucial for building collective capacity and confidence.

CONCLUSIONS AND PROSPECTS

The implementation of the Action Plan "Music Technology in the Educational Process" at the Music School of Amfissa “Eleni Karaindrou” provided a rich case study on the dynamics and challenges of integrating innovative digital tools into music education. The initial findings strongly indicate a positive impact on the development of students' technical skills, the enhancement of their creativity, and their overall engagement in the learning process. The project successfully demonstrated that modern technology can not only coexist with but also enrich the teaching of traditional music, creating a fertile ground for new forms of expression.

The challenges faced underscore the need for systemic support for schools in terms of infrastructure, as well as ongoing pedagogical and technical training for teachers. For the sustainable use of digital technologies in Greek Music Schools and the wider educational reality, the following directions are proposed:

1. **Curriculum integration:** Advocate for the formal integration of music technology into the curriculum, either as a standalone subject or through a cross-curricular approach, to ensure all students have access to these vital 21st-century skills.
2. **Creation of networks:** Foster the development of networks and communities of practice among Music Schools. Such networks would facilitate the sharing of best practices, curriculum materials, and technical expertise, creating a supportive ecosystem for innovation.
3. **Emphasis on open-source tools:** While professional software is valuable, promoting the use of high-quality open-source alternatives (like Audacity and MuseScore) can broaden access and ensure that learning is not contingent on expensive software licenses.
4. **Strategic professional development:** Design teacher training programs that are ongoing, collaborative, and grounded in pedagogical frameworks like TPACK and DigCompEdu, moving beyond one-off technical training seminars.

Ultimately, the pedagogically-driven use of technology has the potential to transform music education, making it a more dynamic, creative, and relevant experience that resonates with the lives of contemporary students and prepares them for a future where art and technology are inextricably linked.

ABSTRACT

This study examines the influence of Greek scholars from the Byzantine and Post-Byzantine periods, such as Chalkokondyles, Chrysoloras, and Laskaris, on the Florentine Renaissance, utilizing digital media and information and communication technologies (ICT). The aim was to highlight the pivotal contribution of these significant figures to the shaping of the intellectual landscape of the Renaissance and to explore how the transmission of Greek philosophy and ancient Greek texts influenced the development of Western thought and art. The project employed modern digital tools, including PowerPoint presentations, images, videos, and audio recordings, to create a multidimensional presentation offering a comprehensive understanding of the topic.

Guided by their teachers, the students used digital tools to develop a presentation that emphasized the connections between the classical Greek heritage and the artistic and philosophical developments of the Renaissance. Furthermore, they composed and set to music an original poem about the period, thereby deepening their engagement with the artistic and cultural dimensions of the subject and combining textual analysis with musical expression. This process helped students understand how Greek scholars, through the revival of ancient Greek texts, influenced Italian Renaissance intellectuals and artists, fostering a cultural dialogue that shaped the trajectory of Western civilization.

The students' work was presented at a student conference, where the use of digital media was combined with live student presentations. PowerPoint served as the primary presentation tool, while the students provided live explanations and interacted with the audience, elaborating on the findings of their research. This live presentation allowed the students to clarify key aspects of their work and enhance engagement with participants.

The results of our study were highly positive. Students gained a deep understanding of the Florentine Renaissance and the contribution of Greek scholars to the intellectual and cultural flourishing of the era. Additionally, they developed digital skills alongside their ability to create multidimensional presentations. The integration of music and video significantly enriched the learning process, fostering a more dynamic and impactful educational experience. The combination of theoretical analysis with modern technology offered students the opportunity to develop a cross-cultural approach to the topic, enhancing their creativity and communication skills.The abstract should include the focus of your paper, i.e., what your paper is about, a brief description of the steps or methodology used, the main findings of the paper, and its results.

Keywords: Florence, Renaissance, Byzantine Scholars, Digital and Technological Media.

INTRODUCTION

The Florentine Renaissance, which flourished during the 14th and 15th centuries in northern Italy, and particularly in the city of Florence, constitutes one of the most decisive periods in the history of Western civilization. This era is characterized by a profound transformation of cultural, philosophical, and scientific values, marking the transition from the medieval worldview to a new anthropocentric orientation. At the core of this cultural rebirth lay the rediscovery and revival of ancient Greek and Roman ideas, which formed the foundation for the development of humanistic spirit, rational thought, and artistic creation.

As Anthoulias (2023) notes, the Renaissance was shaped through the fusion of past achievements with a new desire for progress and intellectual independence. In this context, ancient Greek philosophy and art served not only as a source of inspiration but also as a cornerstone for building this new era. The Greek scholars of the late Byzantine period, many of whom sought refuge in the West after the Fall of Constantinople, played a pivotal role in this process.

Notable examples include figures such as Demetrios Chalkokondyles, Manuel Chrysoloras, and Ianos Lascaris, who contributed decisively to the cultural exchange between Greek and Italian intellectual traditions. Through their work in copying, translating, and teaching Greek philosophical and literary texts, they made Greek wisdom accessible to the educated public of Italy and fostered interest in the study of the classics (Cammeli, 2004; Cammeli, 2006; Staikos, 2012). Their efforts bolstered the humanist movement, which emphasized the centrality of the individual and their intellectual capacities.

According to Stafylakis (2015), these scholars were not merely bearers of knowledge but mediators between two worlds: the Eastern Byzantine and the Western Renaissance. Their work contributed to the formation of a common European intellectual space grounded in classical Greek education.

Within the framework of the present research and educational activity, students were tasked with investigating the contribution of these Greek scholars to the cultural renaissance of Florence and Italy more broadly, utilizing contemporary Information and Communication Technologies (ICT). This methodological choice was deliberate, aiming to strengthen the interdisciplinary approach to history and culture through active student participation, thereby enhancing research, collaboration, and digital expression skills.

By employing interactive applications, multimedia, and digital presentations, the student research team created a project that combines meticulous historical documentation with modern technological interpretation. Their work went beyond mere reproduction of information, seeking to craft a living narrative that connects the past with the present and makes classical heritage accessible and engaging to today's audience.

This presentation, specifically prepared for the student conference, represents a comprehensive effort to clearly and originally convey the contribution of Greek scholars to the Florentine Renaissance. Simultaneously, it aims to highlight how contemporary educational processes can benefit from interdisciplinarity and the use of digital tools, offering students the opportunity to develop a deeper, experiential relationship with historical knowledge and culture. Through this project, students not only understood the role of scholars in the revival of European intellectual life but also actively participated in a process of cultural production, integrating their own voice into the modern educational and cultural dialogue.

SOURCE ANALYSIS AND HISTORICAL INTEPRETATION

A crucial part of the research process was the in-depth analysis of primary and secondary sources, as well as the historical interpretation of the findings through the lens of Renaissance epistemology and the historical comparative method. The students approached the material not as passive recipients of knowledge but as active researchers, attempting to interpret events based on well-documented historical data and critically evaluated scholarly references. This process allowed for the unveiling of deeper cultural, ideological, and philosophical mechanisms that shaped the era of the Florentine Renaissance.

The theoretical foundation centered on the works of Jacob Burckhardt and Paul Oskar Kristeller, who highlighted the connection between the Renaissance and the turn toward humanism and the reevaluation of antiquity. Specifically, the students discovered that humanism was not merely a return to the ancient past but a reframing of ancient values within the context of a new era, marked by a strong need for intellectual autonomy and individual expression.

In this framework, the contribution of the Greek scholars was analyzed as a cultural bridge between the Hellenistic tradition and European humanism. Manuel Chrysoloras, for example, was interpreted not simply as a teacher of the Greek language but as a pioneer of cultural transmission, whose translations and pedagogical methods profoundly influenced philologists such as Leonardo Bruni and, through them, the intellectual climate of Florence.

The contribution of Demetrios Chalkokondyles was examined in the context of the University of Florence, where through his interpretative readings of Homer and Plato, he revived classical literature in a way that combined historical understanding with the contemporary issues of the era. His emphasis on the logical analysis of ancient texts and their connection to the political and social realities of the Renaissance was innovative and deeply influential.

Ianos Lascaris was approached not only as a scholar but as a synthesizer of knowledge. His translations of Aristotle's works, as well as his collection and preservation of Greek manuscripts, made him a fundamental figure in the transmission of the Greek philosophical tradition. Furthermore, his involvement in European diplomatic and intellectual missions highlighted the international dimension of Greek humanism.

Special attention was given by the students to the comparative study of the literary tradition, focusing on the interpretation of commentaries, prefaces, and translation strategies employed by the Greek scholars. From this perspective, the Greek scholarly presence was understood not only as a linguistic or philosophical intervention but as a cultural phenomenon that shaped Western intellectual life at its core.

Thus, this research unit constituted a fertile exercise in historical interpretation, combining primary documentation with the theoretical approach of Renaissance science and philosophy. The students acquired valuable skills in the critical reading of historical sources, comparative thinking, and the interpretative approach to cultural transformations—key elements for cultivating historical consciousness within modern education.

CREATION OF A POWERPOINT PRESENTATION

In the second phase of the research project, a primary concern was the transfer of the historical findings into a visual and interactive environment through the creation of a presentation using Microsoft PowerPoint. The choice of this particular tool was not accidental. On the contrary, it responds to modern pedagogical and technological requirements, enhancing the multimodal construction of knowledge and the emotional engagement of the audience by utilizing image, speech, and motion.

The design process of the presentation followed structured steps of content and narrative planning, aiming for clarity of meaning and aesthetic completeness. The students, in close collaboration with their supervising teacher, dedicated themselves to the careful selection and interpretation of visual material, including photographs of Florence, maps of Renaissance Italy, portraits of notable figures, as well as representations of characteristic works of painting and architecture. The selected works did not function merely as decorative elements but served as commented evidence integrated into the historical narrative.

Special emphasis was placed on highlighting the relationship between Renaissance artists and thinkers and Greek literature and philosophy, aiming to understand how the Greek spirit acted as fertile ground for the flourishing of Renaissance art and thought. The inclusion of references to selected paintings, such as those by Botticelli and Michelangelo, was accompanied by an analysis of the philosophical background permeating them, particularly through the influence of Plato and Aristotle.

Particular emphasis was placed on presenting the Greek scholars who, through their presence and activity, shaped the ideological and philosophical foundation of the Florentine Renaissance. Through carefully crafted slides, the biographical and intellectual journeys of Manuel Chrysoloras, Demetrios Chalkokondyles, and Ianos Lascaris were analyzed. The students highlighted not only their educational works and translations but also their fundamental contribution to the dissemination of the Greek cultural paradigm in 15th-century Italy (McManus, 2011; Miller, 2009).

This endeavor was not limited to merely listing information. On the contrary, it made full use of PowerPoint's capabilities for interactive navigation, incorporating hyperlinks to videos, digital libraries, and concept maps, thereby promoting the active participation of the audience. The students delivered the presentation with rhetorically well-founded speech, presenting their historical findings in a convincing, enriched, and accessible manner.

In summary, this presentation served as a canvas where historical narration meets modern technology. The combination of historical accuracy and visual representation not only offered a better understanding of the subject but also functioned as a tool for educational empowerment, enhancing the students' communicative confidence, digital literacy, and interpretative skills. The final result not only documented but also visually, culturally, and emotionally captured the spirit of the Florentine Renaissance, illuminating the contribution of Greek scholars to the rebirth of Europe.

CREATION OF AN INTERACTIVE MAP

The third phase of the research process focused on the geospatial representation of historical reality, using the digital tool Google My Maps. This choice aligns with the contemporary trend of digital cartography in education, which combines elements of historical research with technological skills and critical spatial analysis.

Organized in groups, the students identified and recorded key locations in Florence directly connected to the presence and activities of Greek scholars during the Renaissance period. Among the highlighted sites were:

1.The Palazzo Vecchio, seat of political power and a gathering place for scholars,
2.The Florentine School, where figures such as Manuel Chrysoloras taught,
3.The Monastery of San Marco, linked to the philosophical dialogues of the era,
4.The Laurentian Library, a center for the collection of Greek manuscripts, translations, and commentaries.

Each location was accompanied by historical information, visual material, brief analyses, and links to the biographical details of the Greek scholars. Through this process, the students did not limit themselves to simple geographic recording but moved towards a meaningful interpretation of space, demonstrating its symbolic and intellectual significance during the Renaissance.

This mapping enhanced spatial awareness and highlighted the interdependence of place and spirit, emphasizing how specific geographic hubs served as centers of intellectual fermentation and transmission of Greek literature. Simultaneously, the project provided an innovative tool for presenting historical knowledge, useful both for educational purposes and for further research use by the academic community.

MUSICAL SETTINGS OF A POEM AND USE OF MUSIC

The fourth phase of the project marked a culturally bold and creatively innovative approach: the artistic representation of historical content through the musical setting of a poem. This choice aimed not only at the aesthetic enhancement of the presentation but also at approaching the past through the experience of art and sound.

The students composed original music using modern digital music production tools such as GarageBand and FL Studio. The composition was designed to convey the emotional and spiritual atmosphere of the Florentine Renaissance, blending elements of early period music with contemporary sounds.

The selected poem, inspired by the ideals of Humanism and the cultural fusion of East and West, served as the lyrical canvas upon which the students expressed the knowledge, impressions, and sensations they gathered from their research. The musical composition was accompanied by audiovisual material, including:

1.Renaissance artworks,
2.Landscapes of Florence,
3.Portraits of the Greek scholars,
4.And videos featuring excerpts from the interactive map presentation.

The final product took on the character of a symphony of historical memory, transporting the audience along a spatiotemporal axis that combined past and present, knowledge and emotion, historical interpretation and artistic expression.

From a pedagogical perspective, this activity served multiple goals: fostering creativity, developing aesthetic judgment, interdisciplinary integration of History, Music, and Informatics, as well as collaborative artistic cooperation. The students were given the opportunity to experience the Renaissance not as a distant, static historical event but as a living cultural experience, which they were called upon to reconstruct and represent through their own creative lens.

PREPARATION FOR THE CONFERENCE

The final phase of the research project focused on the systematic preparation of the final presentation at the student conference, held before a live audience in a setting simulating an academic environment. This process marked the culmination of a series of interdisciplinary and pedagogical activities through which the students were called to transform historical knowledge and creative production into communicable and scientifically structured content.

The presentation was organized thematically by areas of responsibility: each student took charge of a specific section of the research unit, whether it concerned the historical documentation of the Greek scholars and their influence on the Florentine Renaissance, the analysis of philosophical and linguistic currents, or even the musical and artistic depiction of the era.

During the presentation, special emphasis was placed on:

-The argumentative substantiation, based on the bibliography (e.g., Burckhardt, Kristeller, Cavallo, McManus, etc.),

-The use of audiovisual material, such as maps, artworks, videos, and slides, aimed at enhancing vividness,

-The integration of modern technologies (PowerPoint, Google My Maps, digital music), which qualitatively upgraded the presentation and enabled the creation of a multisensory experience.

The final structure of the presentation followed academic standards, introducing the audience to the historical context of 15th-century Florence and then proceeding to analyze the figures, ideas, and cultural interaction between Greece and Italy. The highlight of the presentation was the musical performance through the setting of a poem, which gave the final product artistic coherence and emotional depth.

Notably, the entire process strengthened collaboration, autonomy, public speaking, and the scientific attitude of the students. The oral and digital presentation of the findings aimed not merely at reproducing knowledge but at active participation in public discourse, under conditions that simulate real academic or scientific practices.

Finally, the conference itself functioned as a space for disseminating good practices in educational innovation, showcasing a model school that integrates an interdisciplinary approach, digital technologies, and creative expression, supporting a deeper understanding of the past through the challenges of the present.

CONCLUSIONS

This research and educational activity systematically and methodologically highlighted the potential offered by an interdisciplinary approach and the utilization of Information and Communication Technologies (ICT) in the study of historical phenomena. Integrating the Florentine Renaissance into the school context not only enriched the students' cognitive horizon but also contributed to the formation of new forms of understanding, expression, and presentation of knowledge.

1.Combination of Tradition and Technology

The project demonstrated the effectiveness of combining traditional historical research with the use of innovative digital tools. Students did not limit themselves to passive information retrieval but actively engaged in digital creation and processing activities, such as producing interactive maps and composing music. This contributed to the development of a new dynamic in history teaching, transforming narrative historical knowledge into a multimodal experience with visual, auditory, and experiential features.

2.Enhancement of the Learning Experience

The use of digital media expanded the pedagogical nature of the experience, enhancing active student participation and fostering both cognitive and metacognitive skills. Students developed abilities in critical source analysis, information management, and digital expression, while deepening their understanding of themes related to the synthesis of art, philosophy, and culture. Through experiential learning, they gained a fuller comprehension of the role of the Florentine Renaissance as a transitional stage toward modern European civilization.

3.Highlighting Cultural Heritage

One of the central aims of the project—the highlighting of the contribution of Greek scholars to Renaissance thought and the revival of antiquity—was achieved with scientific accuracy and documentation. Students understood that figures like Chalkokondyles, Chrysoloras, and Laskaris were not merely translators or teachers but bearers of values,

meanings, and cognitive traditions that profoundly influenced the intellectual character of the Renaissance. Thus, the project functioned as a means of conscious re-engagement with cultural heritage, illuminating the role of the Greek spirit in Europe's historical trajectory.

4.Interactive Presentation and Audience Engagement

The presentation of the results at the conference demonstrated the impact that a multimedia, interactive, and emotionally charged approach can have on knowledge transmission. The use of digital maps, visual media, and musical composition created a multisensory discourse that enhanced the audience's experience and brought immediacy to the educational process. Through this approach, scientific content was effectively communicated to a non-specialist audience without compromising validity and quality.

5.Development of Collaboration and Creativity

Finally, special significance lies in fostering collaborative and creative skills as an outcome of teamwork. Students shared roles, collaborated in documentation, jointly designed the presentation, and collectively supported the final execution of their work. The rotation of roles, co-creation, and taking responsibility for the presentation provided valuable experiences in developing personal and social skills that transcend the narrow confines of the course and align with 21st-century education principles.

GENERAL CONCLUSION

This particular research activity proves that the integration of ICT, combined with interdisciplinary and experiential practices, constitutes a fully functional and effective model for teaching history. The study of the Florentine Renaissance was not merely an object of cognitive processing but was transformed into a cultural event within the school community, highlighting the school's role as an agent of interpreting and disseminating historical memory through contemporary means.

RICHARD MAYER'S MULTIMEDIA LEARNING AND THE CREATION OF EDUCATIONAL VIDEO IN CONTEMPORARY TEACHING MODELS

Zachariadi Vasiliki
Teacher of Applied Arts (8901), MSc in Public Discourse and Digital Media
4th Vocational High School
Larissa, Greece-
email: baso1010@yahoo.gr

ABSTRACT

The rapid advancement of technology has rendered educational video a key tool in teaching, enhancing learning through a variety of stimuli. According to Richard Mayer's Multimedia Learning Theory, learning becomes more effective when information is presented through audiovisual means, engaging both the visual channel (images, videos, diagrams) and the auditory channel (speech, sounds, music). This theory is based on three fundamental principles: dual processing of information, the limited capacity of working memory, and the active processing of cognitive load.
Educational video is dynamically integrated into all modern learning models, reinforcing understanding and the assimilation of knowledge. In the Flipped Classroom model, students engage with educational videos before the lesson, allowing in-person instruction to be enriched with collaborative and experiential activities. In the Blended Learning model, videos serve as a bridge between traditional and online learning, offering flexibility and personalization.

Furthermore, educational video plays a central role in Differentiated Instruction, as it can be adapted to various difficulty levels, learning preferences, and learning paces. In Inclusive Education, multimedia elements support access for students with learning difficulties, using subtitles, narration, and interactive tools. Educational videos contribute to improved comprehension and more effective lesson organization. Similarly, in Tiered Instruction, teachers create multiple versions of the same video, tailored to students' abilities.

The effective creation of educational videos requires the application of Mayer's principles, including spatial and temporal alignment of text and image, elimination of extraneous information (minimizing cognitive load), and active student engagement through questions and interactive components.

In conclusion, the use of educational video—when grounded in the principles of multimedia learning—can transform the teaching process, making it more adaptable, personalized, interactive, and effective, while enhancing students' comprehension and engagement in today's classroom.

Keywords: Multimedia Learning, educational video

INTRODUCTION

This presentation is based on a literature review and outlines the theoretical foundations of Mayer's principles of multimedia learning, as well as their practical application to the development of educational videos. These principles are fundamental for the effective presentation of information in multimedia environments. The paper examines the influence of various multimedia components on cognitive processing and memory.

It presents findings from studies that have evaluated the effectiveness of educational videos developed according to Mayer's multimedia learning principles.

The purpose of this presentation is to offer practical and applicable solutions for enhancing learning through multimedia. It provides a framework for creating instructional videos that align with students' needs and capabilities, thereby improving the educational experience and encouraging active student participation in the learning process.

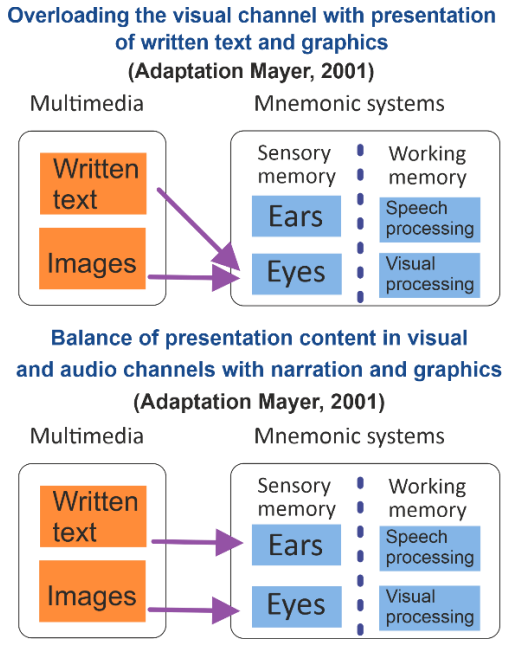
Cognitive Subject Learning Theory – Principles of Mayer's Multimedia Theory

A multimedia lesson is the presentation of an instructional unit through the use of multiple technological applications. A key factor is the interaction between the user and the system, which activates the learner within the educational process. The underlying principle is that the learner interacts within this enriched environment, making learning more effective (Toomey & Ketterer, 1995).

The challenge in multimedia teaching—as in any learning program—is to construct lessons in ways that align with how human learning functions. For this to be effective, instructional strategies must support the learning process. They must foster the psychological factors necessary for learning. The construction of knowledge should be based on three foundations of cognitive theory (Mayer & Clark, 2008). The central challenge of instructional design is how to encourage learners to engage in appropriate cognitive processing during learning, without overloading the capacity of either the verbal or visual channel (Mohamed Ibrahim, 2012). Human sensory processing comprises two distinct channels: one for visual or pictorial information and another for auditory or verbal information (Mohamed Ibrahim, 2012):

- Dual Channel: People have separate channels for processing visual/pictorial material and auditory/verbal material (Figure 1).
- Limited Capacity: Individuals can process only a limited amount of information in each channel at any given time.
- Active Processing: Learning occurs when people actively engage in appropriate cognitive processes, such as focusing on relevant content, organizing it meaningfully, and integrating it with prior knowledge (Figure 2)

Figure 1
Dual-channel processing of visual/pictorial and auditory/verbal information (Mayer, 2001)



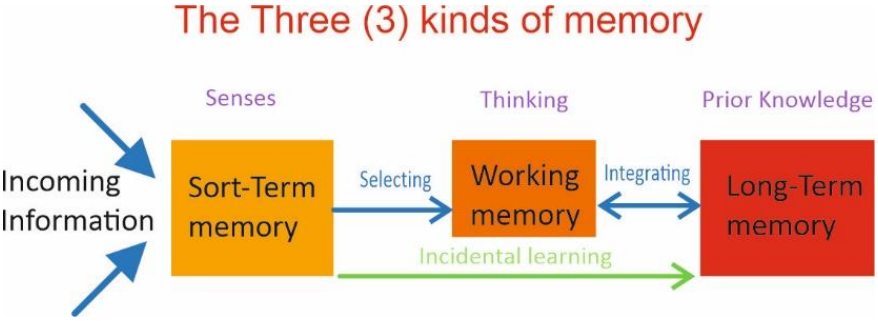


Figure 2
Active Processing. Adapted from Mayer (2003), Marois (2005), Miyake (1999)

- Multimedia Features That Lead to Positive Outcomes
- **Dual coding** of verbal and non-verbal (visual) information in memory
- **Learner control,** whereby the student takes responsibility for their own learning
- **Constructivist multimedia learning,** which supports environments where learners build their own mental models by integrating multiple cognitive representations (Mayer & Moreno, 1999)

MULTIMEDIA LEARNING THEORIES

Take-Home Message

"People learn better when multimedia messages are designed in ways that are consistent with how the human mind works and with research-based principles."— *Richard Mayer*

The Multimedia Principle

The multimedia principle states that people learn better when content is presented using both words and graphics rather than words alone. Moreover, words should be presented as spoken narration rather than as text on the screen (Clark & Mayer, 2016; Mayer, 2009, 2014).

Multimedia lesson presentations encourage learners to process information and the connections between elements.

Encouraging active engagement in learning leads to better outcomes.

The Coherence Principle

The coherence principle states that people learn better when messages include only the information that is necessary. Texts and visuals should be in simple form and directly relevant to the subject matter (Water Bear Learning, 2020). Extraneous material competes for cognitive resources in working memory and can divert attention away from important content, leading the learner to integrate it with unrelated topics (Cambridge University Press, n.d.).

The addition of visual and auditory enhancements—such as music, background videos, or soundtracks—designed to make multimedia content more attractive and engaging is based on **arousal theory**. The core idea of arousal theory (Dewey, 1913; Renninger, Hidi & Krapp, 1992) is that students enjoy learning when they are emotionally stimulated. In contrast, **cognitive multimedia theory** suggests that interesting but irrelevant elements may interfere with the learning process by causing d**istraction,** by interrupting attention, d**isruption**, by interfering with the sequence of thoughts, and d**iversion**, by incorporating secondary elements that lead away from the core learning message.(Mayer, *The Psychology of Learning and Motivation*, 2002)

The Signaling Principle

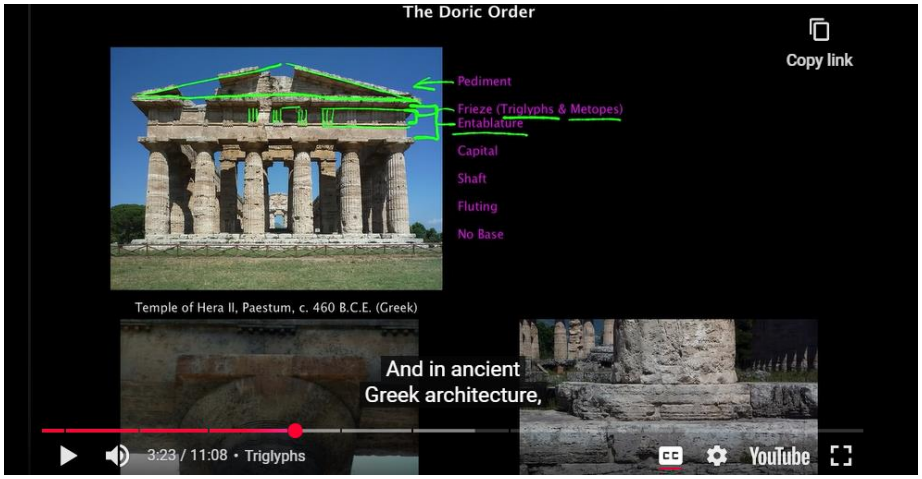
The signaling principle states that people learn more easily when they are guided as to where to focus their attention on the screen (Water Bear Learning, 2020). Signals do not introduce new text but help emphasize a rationale for how ideas can be organized in a presentation. Signaling reinforces the semantic links between core ideas and their interrelations (Mayer, *The Psychology of Learning and Motivation*, 2002).

In the study “Eye Tracking Research in Multimedia Design” (l.b. dr.iastate.edu), words with signaling took less time to identify than plain text words. Eye fixation time in highlighted text places a greater load on cognitive processing (Mayer, 2002).

Highlighting essential information in a lesson can take different forms—for example including a summary sentence at the beginning of a narration that previews key ideas, adding headings that match the structure of the narration (Mohamed Ibrahim, 2012).

Signaling in audiovisual content can also involve: increasing the brightness of specific visual objects, boldening keywords in the text, adding borders or headings (Mayer, 2005; Mohamed Ibrahim, 2012). (Figure 3, Figure 4)

Figure 3
Adding borders in different colors and handwritten headings using the “whiteboard” technique in video (Khan Academy)



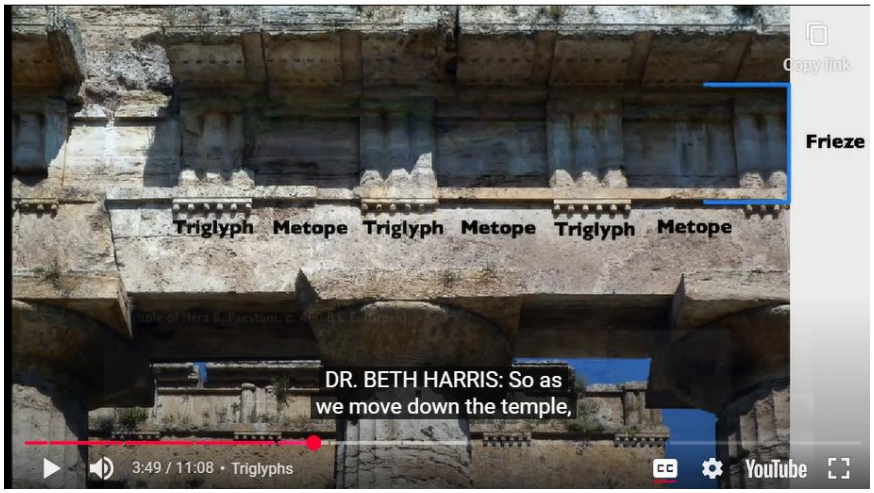


Figure 4
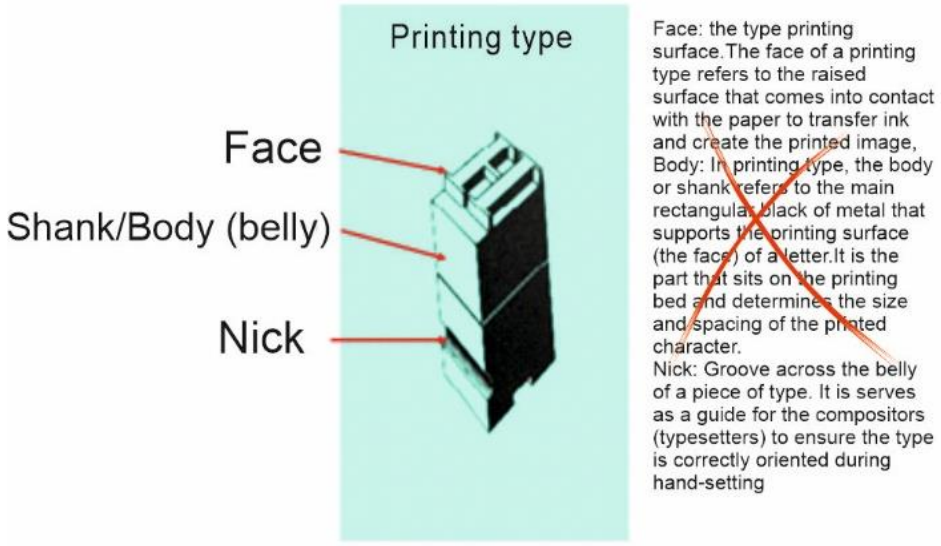
Adding headings (Khan Academy)

The Modality Principle



According to Mayer, the modality principle (Mayer & Clark, 2008) defines the appropriate use of audio narration by learners and designers of multimedia lessons. The psychological evaluation of this matter relates to how the human mind processes information. In educational videos, this principle suggests that presenting information through spoken

narration rather than written text on the screen can improve learning outcomes by reducing cognitive load. The principle is based on the idea that auditory and visual information are processed through separate channels, allowing for more efficient use of working memory (WM). Research has shown that the effectiveness of this method may vary depending on several factors, such as the learner's level of experience, the complexity of the content and the learning environment.

The Redundancy Principle

Very often, a presentation includes both written text on the screen and spoken narration, where the narration repeats the exact same content as the text. This technique is called redundancy, because the printed text on the screen becomes redundant when paired with spoken narration. In practice, it has been shown that people learn better from a combination of images and narration, rather than from images accompanied by both narration and on-screen text simultaneously. In general, printed text should not be added to a graphic that is already accompanied by narration. The psychological advantage of using only audio narration is that it avoids overloading the visual channel of working memory.

Figure 5
Redundancy – Presence of written explanatory text on the screen while also being narrated (Zachariadi, 2022)

The Spatial Contiguity Principle

This principle states that people learn better when images and their corresponding explanatory text are placed close together. To apply this principle correctly, the following should be taken into account:

Avoid separating text and images when scrolling through the screen.

Keywords that are numbered in a graphic should not appear elsewhere on the screen.

Feedback on questions or answers should be displayed together on the screen.

When presenting animation or moving graphics, the explanatory text should not appear separately on half of the screen.

(Mayer, The Psychology of Learning and Motivation, 2002; Mayer & Clark, 2008; Cambridge University Press, n.d.)

The Temporal Contiguity Principle

To apply this principle correctly, the flow of the image should be synchronized with the audio narration.

The spoken text should coincide in time with the graphics or video, rather than being presented in sequence. According to the cognitive theory of multimedia learning, effective learning occurs when the spoken and visual messages

are processed simultaneously in working memory (Mayer, The Psychology of Learning and Motivation, 2002; Mayer & Clark, 2008; Cambridge University Press, n.d.).

Humans understand information by seeking the mental connection between words and images. However, when these elements are presented asynchronously on the screen, additional cognitive processing is required. This increases the cognitive load and reduces the available capacity for learning (Mayer & Clark, 2008).

The Segmenting Principle

The segmenting principle focuses on situations in which learners are required to absorb a large amount of information—so much that the cognitive system becomes overloaded and breaks down, even if the redundancy principle has been applied, meaning that only the essential cognitive material is retained. The result is an overload of the cognitive learning system and the loss of new knowledge. In a lesson or instructional unit, we do not eliminate concepts, definitions, or procedural steps, because doing so compromises the accuracy and integrity of the lesson (Mayer & Clark, 2008). In such cases, dividing the lesson into sub-units helps the learner manage the complexity of the subject matter. Learning is enhanced even further when these short segments are delivered at different points in time, rather than continuously, allowing the learner to decide how much content they can assimilate. This provides learners with control over their learning process by using a "next" button or adjusting the video playback speed.

A learner who watches a narrated video on a complex subject with interactive elements and a fast-paced presentation may lose track of essential content. When this happens, the sequence of knowledge becomes meaningless. This is especially likely if the subject is unfamiliar or the learner needs more time to reflect. The solution lies in segmentation and connecting the thematic units with a "next" function, allowing learners to balance their cognitive ability with the cognitive load (Mayer & Clark, 2008).

In video, segments are defined as portions of dynamic visualizations that have a recognizable starting and ending point and are distinguished by the inclusion of pauses between segments. The purpose of this method is to allow learners to mentally process manageable units of instructional content before moving on to the next portion (Mohamed Ibrahim, 2012).

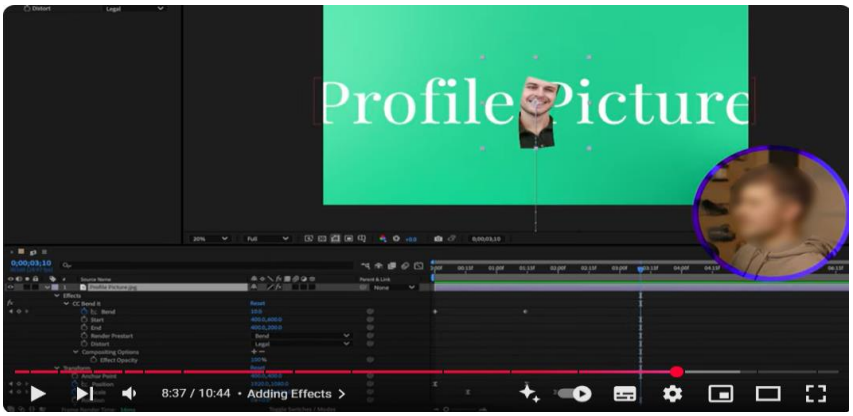
The Personalization Principle

Mayer's previous principles are derived from the cognitive theory of multimedia learning and support the use of concise narrative animations. Research has been conducted to examine the manner of speech used in narration. The recommendation is that narration should not be in formal or academic language but in simple, everyday language (Mayer, The Psychology of Learning and Motivation, 2002).

Additionally, research findings indicate that showing the instructor's face on screen is not considered an effective practice in educational videos (Ou, Chaohua; Joyner, David A.; Goel, Ashok K., 2019).

The Pre-training Principle

By applying the pre-training principle, key words and core concepts are introduced before the lesson, contributing to the understanding of the material. The learner is prepared to grasp the deeper meaning of the topic and to comprehend the concepts, thereby distributing the cognitive load more evenly throughout the multimedia lesson. This principle is of great importance when teaching complex material to beginners, as it reduces the amount of essential processing by spreading the information across the lesson (Turso, 2017).



The Voice Principle

The voice principle states that people learn more effectively when the narration in a video uses a human-like voice rather than a mechanical or robotic one (Water Bear Learning, 2020).

The Image Principle

The image principle, although still in an early stage of research—like the voice principle—suggests that people learn better from videos that include only spoken narration. Videos that feature only explanatory speech by a narrator are widely used in multimedia learning environments (Water Bear Learning, 2020).

Figure 6
The presence of the speaker in video narration (talking heads) (Gavin Herman, 2025)

MULTIMEDIA TEACHING METHODS – VIDEO IN EDUCATION

Video has become an important component of education. It is integrated into traditional classroom instruction, serves as a cornerstone of many blended learning models, and is often the primary method for delivering information in online courses (Brame, 2016).

The design of instructional videos through the lens of multimedia learning significantly influences modern teaching models by increasing student engagement and interest. This approach emphasizes the importance of video duration, segmentation, and coherence, all of which collectively enhance student comprehension and retention.

Weeding, or the removal of interesting but irrelevant information that does not contribute to the learning objective, can also provide additional benefits (Coherence Principle). For instance, background music, complex scenery, or extra features in an animation require the learner to judge whether to pay attention to them. This increases extraneous cognitive load and can reduce learning. It is important that educators consider their students' level when designing educational videos and determine which information is necessary for processing. At the same time, they must remove elements that do not serve the learning goal and that may overload the learners' working memory (Brame, 2016).

Another perspective on the use of educational video is student engagement. The recommended video duration is four (4) minutes. When a lesson plan requires a longer presentation, it should be divided into smaller parts, applying segmentation (Ou, Chaohua; Joyner, David A.; Goel, Ashok K., 2019). Keeping videos short is particularly important for capturing and maintaining students' attention during instruction (Brame, 2016).

Another technique for maintaining student engagement is the use of a conversational tone. This is known as the personalization principle, as defined by Mayer. The use of informal, conversational language in multimedia instruction has been shown to positively impact learning outcomes. This may be because a conversational style encourages learners to develop a sense of social partnership with the narrator, leading to greater engagement and motivation (Mayer, Multimedia Learning, 2002)(Mayer, 2008). When creating or selecting videos, it is important to consider whether they were designed for the specific educational level in which they will be used. The adaptability of a video can be improved during reuse. Instructors can tailor it to a specific classroom by using off-screen narration or on-screen text to establish relevance for that particular audience and topic.

Videos can be used to demonstrate specific manual skills or physical processes—at normal speed, in slow motion, or to highlight relationships, principles, or procedures. They can provide visual access to situations or experiments that would otherwise be too dangerous or expensive for students to experience in person. Videos can simplify complex ideas through media-specific techniques such as animation, computer graphics, or clay models. They can reveal entire "worlds" through photomicrography, astrophotography, night photography, conventional photography, and time-lapse.

Videos can also be used to promote positive behavior and motivate learners. They are particularly effective for introducing new topics or reviewing previously covered material, especially when motivation is crucial for student participation in a learning sequence. According to summaries of current research and teacher surveys, video enhances reading and lecture material, improves student comprehension and discussion, supports a wider range of learning styles,

increases motivation and enthusiasm, and contributes to teacher effectiveness (J. António Moreira, Fouad Nejmeddine, 2015).

Video is a medium of primary importance in both current and future education, even within the context of the growing interest in interactive multimedia. With careful design, video instruction can promote interactive learning. Videos can stimulate students' curiosity, encourage speculation, and foster intellectual engagement. They can initiate discussions and collaborative learning activities, allowing students to apply their existing knowledge and develop the higher-order thinking skills needed to expand it (J. António Moreira, Fouad Nejmeddine, 2015).

CONCLUSIONS – DISCUSSION

Video can serve as a significant medium for improving student learning and increasing their engagement with lessons. Maximizing this benefit comes down to a few key recommendations:

- Keep videos short and focused on learning objectives.
- Use audio and visual elements to convey the appropriate parts of an explanation. Consider how to make these elements complementary rather than redundant.
- Use signaling to highlight important ideas or concepts.
- Use a conversational, enthusiastic tone to enhance students' attention and focus on the lesson.
- Enrich the video with active learning strategies, such as guiding questions, interactive components, or related homework assignments (Brame, 2016).

ABSTRACT

This study investigates the use of information and communication technologies (ICT) in the daily practice of nutrition-dietetics and physical education professionals, focusing on the monitoring of dietary intake and physical activity. The literature indicates that mobile applications, particularly when combined with wearable devices, constitute effective tools for promoting healthy dietary habits and enhancing individuals' adherence to recommended practices. Within this study, the most suitable application was selected from thirty available on the Play Store and App Store and implemented in an experimental procedure involving two patients, in order to evaluate its practical utility and contribution to health management. The results highlight the effectiveness of m-Health tools in monitoring and guiding individuals, while also emphasizing the need for further research with more diverse samples to investigate the long-term benefits and potential risks associated with the sustained use of these technologies. Overall, ICT provides significant opportunities for both health professionals and patients, facilitating personalized monitoring and support, improving adherence to healthy lifestyle behaviors, and enhancing overall health outcomes.

Keywords: ICT, m-Health, nutrition applications, physical activity applications

INTRODUCTION

The rapid evolution of information and communication technologies (ICT) has significantly transformed people's daily lives, affecting almost every aspect of their activities. The use of mobile phones, online applications, and digital tools for task management, education, and communication has established ICT as an integral element of modern citizens' daily life (Røpke & Christensen, 2012). At the same time, the health sector has benefited substantially from the integration of ICT, as these technologies offer new possibilities for monitoring, preventing, and managing individuals' health.

According to the World Health Organization, e-Health is defined as the cost-effective and secure use of ICT to support health services, including care, health monitoring, education, and research (World Health Organization, 2024). Similarly, the European Commission describes e-Health as a superset of distinct categories, such as telemedicine, home-care systems, clinical information systems, integrated health information networks, and secondary non-clinical systems supporting education and research (European Commission, 2024; Sávvas, 2016). These tools—from applications for monitoring diet and physical activity to electronic health records and telemedicine—enable personalized patient support and enhance individuals' active participation in managing their health (Sarwar et al., 2018).

Particularly important is the application of ICT in monitoring dietary intake and physical activity through m-Health tools and wearable devices that allow real-time data recording. These applications provide capabilities such as food logging, calorie counting, activity tracking, and personalized feedback, contributing to the adoption of healthy dietary habits and the promotion of physical fitness (Sim, 2019; Vrhovec, 2016). The integration of ICT into health management allows health professionals, such as dietitians and nutritionists, to monitor patients remotely, providing timely interventions and personalized guidance.

Despite the significant benefits, the use of health applications by older individuals faces challenges due to digital illiteracy, highlighting the need for awareness and training programs for this population group (Fox & Connolly, 2018). Overall, m-Health technology provides tools that can improve individuals' quality of life and the efficiency of health systems, although further research with diverse samples is required to assess long-term benefits and risks.

The present study focuses on evaluating the usability of mobile health applications for monitoring diet and physical activity through an experimental procedure with two patients, connecting the literature review with practical application and highlighting the importance of ICT in the daily professional practice of dietitians and nutritionists.

LITERATURE REVIEW

Use of ICT in Dietary Intake

The utilization of ICT in dietary intake has emerged as a powerful tool for monitoring and improving dietary habits. Studies indicate that the use of mobile phone applications for recording dietary consumption increases compliance with dietary guidelines and improves dietary habits (Paramastri et al., 2020). Wearable devices for monitoring dietary intake have also proven effective at an individual level (Sempionatto et al., 2021). Additionally, the development of portable chemical sensors offers new possibilities for molecular-level monitoring, enhancing precision nutrition tailored to individual needs, metabolic profiles, and environmental factors (Hingle & Patrick, 2016).

Nutrition applications for wearable devices and smartphones make self-monitoring more accessible, with positive results in intake recording and changes in dietary habits and anthropometry (Lieffers & Hanning, 2012). However, the effectiveness of applications may vary depending on the recording method, requiring proper user education for accurate interpretation of energy and nutrient intake (Evenson & Berens, 2021). Overall, ICT provides significant capabilities for supporting healthy dietary habits and integrating them into professional healthcare practice, promoting personalized monitoring and enhancing compliance with dietary programs

Use of ICT in Physical Activity

The continuous decrease in physical activity and the adoption of sedentary lifestyles contribute to the emergence of cardiovascular diseases, neurodegenerative diseases, and obesity (Sarikavazis, 2021). International organizations recommend at least 150 minutes of moderate-intensity or 75 minutes of vigorous-intensity physical activity weekly for adults to maintain cardiovascular health (Lichtenstein et al., 2016).

ICT has been integrated into physical activity management through applications that record daily steps, heart rate, oxygen intake, and distance using GPS, accelerometers, and other sensors (Molina & Sundar, 2018). These

applications analyze data, provide personalized guidance, set goals, offer incentives, and incorporate social-sharing capabilities (Higgins, 2016). They also facilitate monitoring of diet, weight, sleep, and stress, enhancing communication between patients and health professionals. Their effectiveness is further strengthened by gamification and data visualization features (Paramastri et al., 2020; Napolitano et al., 2022).

Future research should investigate design characteristics that contribute to long-term behavioral change, independent of continuous app use.

Available Applications

Numerous mobile health applications (MHAs) have been developed to improve quality of life and support users' health management (Sarwar et al., 2018). These applications can be installed on mobile or portable devices, offering an easy way to monitor daily habits such as calorie intake and physical activity, while some provide guidance for healthy choices. Many applications also offer support functions such as forums, barcode scanners, and synchronization with wearable devices, promoting user motivation toward achieving goals such as weight loss.

Self-monitoring has been associated with improved awareness of habits and the promotion of a healthy lifestyle. Table 1 summarizes the available applications, including user ratings and download numbers.

Table14
Summary table of applications

	SUMMARY TABLE OF APPLICATIONS		
No.	Application	User rating	Downloads
1	LooseIt	4,2	10M. +
2	Running App - GPS Run Tracker	4,8	10M. +
3	My Fitness Pal	4,1	100 M. +

30	Mi Fitness	4,5	10 M. +

Despite the existence of numerous studies regarding the use of Information and Communication Technologies (ICT) for monitoring dietary intake and physical activity, further long-term research is required to estimate the long-term benefits and potential risks from their continuous use. The available data indicate that applications contribute to achieving personal goals; however, sufficient information is not provided on maintaining new habits after the completion of usage programs. Regarding nutrition applications, limited reliability is observed, due to incomplete or locally restricted food databases, which limits the accuracy in recording energy and nutrient intake. Conversely, physical activity applications seem to yield positive results in the short term, although they present limitations, such as limited exercise variety and lack of an engaging environment or automatic step recording. Overall, M-Health applications appear promising but need further improvement and evolution to be complete and reliable. It is emphasized that they do not replace the guidance of a specialized nutritionist or health professional but function as complementary tools for enhancing self-monitoring and the adoption of healthy habits. The available applications, as presented in Table N, offer an overview of their capabilities, popularity, and limitations, highlighting the need for careful selection by users.

METHOD -- SELECTION AND USE OF NUTRITION AND EXERCISE APPLICATIONS

Within the framework of the present study, from the thirty available mobile health applications, Calorie Counter -- MyNetDiary was selected as the most suitable for monitoring the dietary intake and physical activity of the participants. The application was utilized for recording daily food intake, calories, and nutrients, as well as for monitoring physical activity through step counting, exercise, and calories burned during exercise. Furthermore, the application allows the creation of personalized diet and exercise programs by the health professional, with the entry of participants' basic physical characteristics, such as weight, height, and age. The use of the application supports the evaluation of participants' compliance and achievement of goals, while its data allows for continuous monitoring and feedback. It is noted that the application has reached over five million users globally, indicating its widespread acceptance and reliability within the M-health application community.

RESULTS

In the present study, two participants were selected for the initial investigation of their dietary habits and physical activity through the **MyNetDiary** application. Due to the limited number of participants, the results cannot be considered representative of broader conditions and dietary or exercise practices. The use of a small sample, characteristic of **pilot or exploratory studies**, allows for the trial evaluation of the application's functionality and preparation for future, larger-scale research.

Dietary intake was recorded for six days, including two weekends, to account for potential differences in dietary behavior during rest days. The dietary data were analyzed for energy and macronutrient intake and compared with the application's personalized recommendations, taking into account factors such as gender, age, height, and weight goal.

Physical activity was recorded for two consecutive weeks for each participant and evaluated in relation to international recommendations for adults. The target step range (7,500--10,500/day) was based on the guidelines of international health organizations for promoting physical health. According to the recorded data, the participants achieved the goal of 7,500 steps at a rate of 50% (Participant 1) and 61% (Participant 2). The results are presented in Table 2 and Graph 1.

Table 2
Average daily steps of participants

Participant	Avg. Daily Steps	TargetAchievementRate(%)
1	7.200	50%
2	8.050	61%

The second phase of the study focused on evaluating the energy and macronutrient intake for each participant, adjusted to individual needs based on height, weight, and age. The participants logged all their meals for six days via the MyNetDiary application. After completing the logging (Table 3), the data were compared with the application's personalized recommendations (Table 4) for weight maintenance or slight reduction.

Graph 8
Average daily steps of the patients

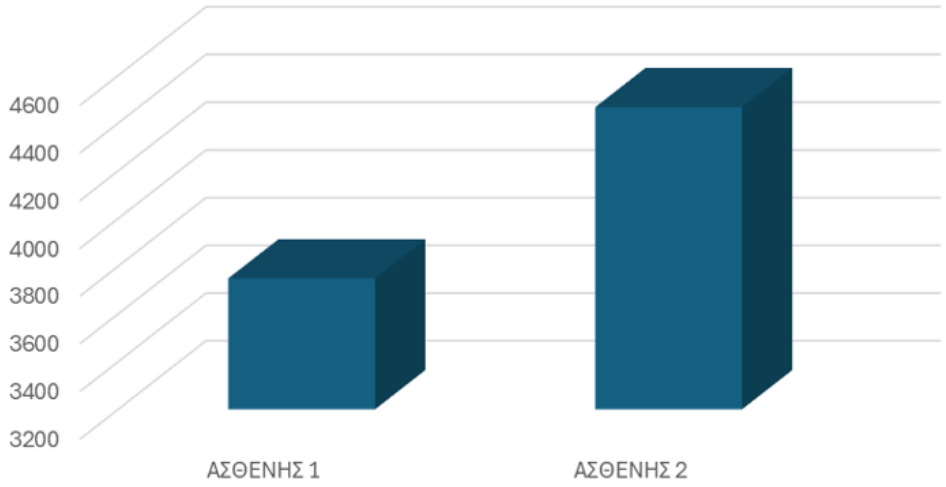

Table 3
Average intake of energy and nutrients for each patient per day

Intake of energy and nutrients				
	Calories-Energy	Carbohydrates	Proteins	Fat
Patient 1	1520	143	69	55
Patient 2	1504	181	93	61

Table 4
MyNetDiary application recommendations for each patient

MyNetDiary application recommendations for intake of energy and nutrients				
	Calories-Energy	Carbohydrates	Proteins	Fat
Patient 1	1747	196	88	78
Patient 2	1243	252	112	87

From the data analysis, it emerges that the participants were not able to fully follow the application's recommendations regarding energy and macronutrient intake for weight maintenance or slight reduction. Specifically, patient 1 covered 87% of her daily energy needs and 78% of the recommended protein intake, while carbohydrate and fat intake were lower, 73% and 71% respectively. Patient 2 achieved 67% coverage of energy needs, 83% of protein, 72% of carbohydrates, and 70% of lipid content.

These results indicate that the participants did not adequately follow the suggested guidelines, which may limit the reliability of conclusions regarding dietary habits and physical activity. The limited observation duration (one week) and the very small sample size constitute significant limitations for the generalization of the findings. For the development of sound interventions, the collection of a larger volume of data is recommended, including dietary intake histories, always with the explicit consent of the participants.

CONCLUSIONS

With the continuous evolution of ICT, the applications available for monitoring physical activity and dietary intake are constantly being developed, making the selection of the most appropriate tool increasingly challenging for health professionals (Chen et al., 2015).

Regarding physical activity, most applications do not provide automatic exercise tracking, but mainly step counting and running logs. Newer applications, however, offer recording capabilities for additional activities such as cycling (Michie et al., 2011).

Many dietary intake monitoring applications contain unreliable data because they are not based on validated food databases. For Greek users, this problem is more pronounced due to the absence of foods commonly found in the Greek market. A major issue is that most nutrition applications are not based on established behavioral change models, resulting in temporary rather than long-term improvements in dietary habits (Michie et al., 2011).

Accurate recording of dietary intake and physical activity is essential for effective nutritional counseling. Incorrect data may lead to inappropriate recommendations, posing risks to patient health. To improve accuracy, dietary intake should ideally be recorded immediately after each meal rather than retrospectively. Applications should therefore include continuous reminders, a feature already present in several tools (Chen et al., 2015).

Health professionals must provide clear instructions regarding daily energy, macronutrient, and micronutrient targets, as well as guidance on how to use the application effectively. The reliability of the data provided by mobile applications must be verified by professionals before being used in clinical decision-making. Incorrect data extraction can be dangerous, potentially leading to overconsumption or underconsumption of essential nutrients.

Patients should not select applications without professional guidance. For individuals with limited digital literacy or limited knowledge of English, a simpler method—such as photographing meals and sending them to the health professional—may be more appropriate. Many modern applications also support barcode scanning, which facilitates food logging (Higgins, 2016).

Physical activity recording should ideally be automatic, requiring minimal user effort. Applications with automatic tracking should include at least exercise duration, energy expenditure, intensity, and heart rate. Automatic monitoring can be enhanced through wearable devices such as smartwatches, smart glasses, or AR/VR headsets, which provide more accurate data synchronized with mobile applications (Thayananthan, 2019).

Equally important is the development of applications based on validated behavioral change models to improve long-term adherence (Michie et al., 2011).

In conclusion, mobile applications can serve as valuable tools for delivering health advice and interventions to both the general population and patients. However, research on their effectiveness remains limited. Existing applications have not been thoroughly evaluated through large-scale experimental studies, and therefore the full extent of their benefits and risks remains unclear. More research is needed to assess their usefulness, reduce risks, and improve their design (Chen et al., 2015; Michie et al., 2011).

Future research should identify factors that enhance user engagement, examine the relationship between user participation and intervention effectiveness, and consider social, economic, and psychological factors. Studies comparing standalone app-based interventions with combined intervention strategies would also be particularly valuable (Michie et al., 2011).

ABSTRACT

This study examines the affective framing of the Asia Minor Catastrophe (1922) in official Greek secondary-school history textbooks through a lexicon-based sentiment analysis. A corpus of all textbook excerpts explicitly referencing Asia Minor was compiled, from which passages reflecting both political and socio-cultural dimensions were manually selected. Preprocessing was conducted in R, including lowercase conversion, tokenization, and removal of stop words. Using a Greek sentiment lexicon, polarity scores were assigned to individual tokens; raw valence sums were aggregated and normalized by passage length to facilitate robust inter-excerpt comparisons. Results indicate that textbook narratives are overwhelmingly neutral (84.2% of labels), suggesting an objective, fact-driven pedagogical approach. Negative sentiment accounts for 14.1% of labels, clustering around descriptions of conflict, displacement, and loss, thereby underscoring the catastrophic nature of these events. Positive sentiment is minimal (1.6%), appearing only in brief references to communal solidarity or reconstruction efforts. Lexicographic profiling further reveals frequent usage of terms such as *ελλάδα* (Greece), *αθήνα* (Athens), and the inclusive pronoun *μάς* (our), reflecting a collective national perspective, alongside temporal markers (*αιώνα*, *χρόνια*) that reinforce chronological structuring. These findings demonstrate that Greek history textbooks maintain scholarly neutrality, punctuated by intensified negativity in trauma-focused sections, with scant positive counterpoints. Furthermore, this study exemplifies the value of computational methods for empirically mapping affective dimensions within educational narratives and lays the groundwork for the development of culturally sensitive, domain-specific sentiment models in historical scholarship.

.

INTRODUCTION

Sentiment analysis (SA) has evolved from early dictionary-based approaches to sophisticated deep learning architectures, offering tools for assessing emotional tone in textual material (Zhang, 2025; Jim et al., 2024). The initial efforts in this discipline were based on sentiment dictionaries, aggregated lists of positive and negative terms, to determine the polarity of documents. Although efficient, these models often proved to be inadequate in accounting for idiomatic expressions, polysemy, and syntactic nuances (Esuli & Sebastiani, 2006; Turney & Littman, 2003). The subsequent emergence of Supervised Machine Learning (SML) techniques, such as support vector machines and Naïve Bayes classifiers, marked a significant improvement, as these models could be trained on annotated corpora of user-generated content, including product reviews and social media posts (Pang & Lee, 2008). The emergence of recurrent and convolutional neural networks has enabled more detailed emotion detection, capturing syntactic and semantic dependencies (Socher et al., 2013). More recently, transformer-based architectures, particularly BERT and its derivatives (Gatti & Huesler, 2025; Tzimiris et al., 2025; Vaswani et al., 2017), have set new benchmarks by learning deep contextual embeddings, thereby improving accuracy in various classification tasks (Prottasha et al., 2022; Devlin et al., 2019). These models, which are available through platforms such as Hugging Face, can be fine-tuned for domain-specific datasets, including those in languages other than English (He et al., 2025). However, despite these advances, SA on historical and educational texts remains a unique challenge, primarily due to archaic lexicons, specialized disciplinary terminology, and the scarcity of annotated datasets in these domains (Bakagianni et al., 2025; Tsakalidis et al., 2018). Consequently, hybrid approaches that integrate dictionary-based features with Machine Learning (ML) models are increasingly used to balance interpretability with computational rigor (Cambria et al., 2017).

The implementation of SA in history textbooks has opened up new avenues for quantifying emotional formation and ideological bias, dimensions that have traditionally been investigated using qualitative methods. As repositories of national memory and identity, history textbooks serve as key tools for shaping students' perceptions of the past (Grever & Van Der Vlies, 2017). Computational techniques can enhance manual content analysis, enabling the processing of entire corpora of textbooks and revealing emotional patterns that human readers may overlook. For instance, Lucy et al. (2020) applied sentiment dictionaries and word embedding to a corpus of US history textbooks used in Texas, revealing a notable underrepresentation of marginalized groups whose appearances were often associated with low energy and adverse effects. Similarly, Hernández-Pérez et al. (2024) conducted sentence-level SA using VADER on English literary texts, identifying emotional self-similarity and tracing tonal trajectories that reflect shifts in narrative affect and thematic emphasis over time. These studies demonstrate that SA can expose not only the presence or absence of a particular group or event, but also the evaluative and affective lens through which it is portrayed. Nevertheless, much of this research has focused on contemporary, English-language textbooks, leaving a significant gap in our understanding of affective framing across historical periods and national contexts (Esfahani, 2024).

The case of Asia Minor in Greek educational discourse is an example of how emotion contributes to the construction of collective memory and national identity. The Asia Minor Catastrophe of 1922, a defining trauma of modern Greek history, is usually depicted in textbooks through a narrative of Turkish aggression and Greek victimization. In their study, Repoussi and Kouseri (2024) demonstrate that high school students overwhelmingly interpreted these textbooks as assigning exclusive blame to the Turkish side, with limited recognition of Greek military actions or broader geopolitical complexities. This reductive framing not only simplifies historical causality but also reinforces a transgenerational memory of grief. Interdisciplinary research increasingly emphasizes that emotion in educational texts operates at the intersection of historical education, political memory, and national discourse (Repoussi & Kouseri, 2024). Scholars of memory studies have long emphasized that narratives of collective trauma, such as the Asia Minor Catastrophe, are preserved and transmitted through the institutions of education, media, and memory (Hirsch, 2012; Assmann, 2011).

Employing SA enables the empirical detection of the emotional valence and intensity that underlie these narratives, thereby informing and refining theoretical models of cultural trauma and *selected trauma* (Caruth, 2010). As Grever and Van Der Vlies (2017) observe, national historical narratives persist in part because they mobilize shared identities and collective loyalties. Computational tools can help reveal the extent to which such narratives are embedded at the linguistic level. However, both historians and digital humanists caution that general models of sentiment, particularly those trained on commercial or contemporary data, may misclassify rhetorical tropes, figurative language, or culturally specific idioms. These limitations underscore the need for collaborative approaches that bring together Natural Language Processing (NLP) experts and historians to develop validated, context-sensitive lexical and interpretive frameworks (Underwood, 2019).

In conclusion, SA is a methodological field for investigating the affective architecture of historical narratives in textbooks. The Greek case of Asia Minor offers an opportunity to apply these tools in a context where national identity,

historical trauma, and pedagogical discourse are closely intertwined. Drawing on memory studies, political theory, and computational linguistics, future scholarship can devise culturally and historically appropriate models that capture the affective dynamics of educational texts.

METHODOLOGY

This study employs a quantitative content analysis framework, including SA, to investigate the representation of Asia Minor in official Greek secondary school history textbooks, adopting a lexicon-based SA methodology to ensure transparency and replicability (Thomos et al., 2023; Zourna et al., 2021). The corpus comprises every Greek secondary-education history textbook featuring explicit references to Asia Minor (Bitzenis et al., 2025D). Relevant passages were manually identified and extracted to achieve balanced coverage of both the political events and the socio-cultural dimensions of the Asia Minor Catastrophe (Koutsoupias & Nosios, 2025).

In the preprocessing phase, all excerpts were converted to lowercase and tokenized in R, followed by the removal of stop-words. No further morphological processing (e.g., stemming or lemmatization) was applied, thereby preserving original word forms and reducing the risk of introducing bias. This concise pipeline ensures that subsequent sentiment evaluations are based solely on the texts' authentic lexical content. For sentiment quantification, a Greek lexicon was employed, which assigns empirically validated polarity scores to individual terms (Rokkou et al., 2022; Chantavaridou & Kapidakis, 2021). Within R, each token's valence score was retrieved from the lexicon and aggregated across each excerpt to produce a composite sentiment index. To adjust for variation in excerpt length, a normalized sentiment score was also computed by dividing this composite index by the total token count (Bitzenis & Koutsoupias, 2024A; Bitzenis & Koutsoupias, 2024B). By reporting both raw and length-adjusted indices, this dual-metric approach facilitates robust comparisons across passages of differing lengths without requiring manual label-to-value conversions (Bitzenis et al., 2025B; Bitzenis et al., 2025C).

Finally, the data were presented through graphs and summary frequency tables, where each extract is captured as a number of positive, negative, and neutral labels. The combined use of visual representations and statistical tables promotes clarity in reading the emotional patterns and ensures the transparency of the methodology (Bitzenis et al., 2025A; Bitzenis & Koutsoupias, 2023A; Bitzenis & Koutsoupias, 2023B). Considering that the analysis was based solely on a Greek lexicon, without further morphological treatments or complex algorithms, potential sources of bias are minimized, thereby preserving the validity of the results (Rokkou et al., 2022). In this way, the emotional tone of the texts on Asia Minor is accurately conveyed, while the data and the analysis code are fully reproducible (Bitzenis et al., 2023). Nevertheless, the inherent cultural and linguistic particularities of historical Greek texts present a challenge for purely lexicon-driven approaches, which may fail to capture context-dependent nuances in sentiment. This limitation underscores the potential value of domain-specific resources or hybrid methodological frameworks in subsequent research endeavors (Michailidis, 2024; Stamatis et al., 2020).

RESULTS

This section presents the quantitative and lexicographic findings of SA in the textbook texts. The data illustrate both the distribution of emotion categories and the contribution of the most frequent lexical items in shaping the narrative tone.

Table 1.
Frequency of appearance by emotion category

Category of Emotion	Frequency of Appearance
Neutral	13.700
Negative	2.299
Positive	268

The lexicographic analysis of emotion, as shown in Table 1, revealed a tripartite distribution, with 13,700 (84.2%) neutral, 2,299 (14.1%) negative, and only 268 (1.6%) positive labels. The predominance of neutrality underscores the vastly informative character of the text, which emphasizes the presentation of facts, dates, and descriptions without any obvious emotional charge. In contrast, the significant proportion of negative passages reflects the emphasis on the traumatic elements of the Asia Minor Catastrophe, reinforcing the dramatic weight of the narrative. The extremely low presence of positive fragments (1.6%) demonstrates the scarcity of references to moments of relief, solidarity, or reconstruction, which reinforces the positive connotation in very few instances.

Overall, the distribution indicates that an informative and predominantly neutral tone characterizes the textbooks, reflecting an underlying emphasis on accurate documentation and factual reporting of historical events. Instances of negative sentiment occur with notable frequency, highlighting themes such as conflict, displacement, and loss, whereas positive expressions appear more sporadically and are typically confined to brief and context-specific segments. This pattern suggests a narrative structure in which neutrality serves as the dominant register, with negative sentiment accentuating critical episodes and positive elements offering measured counterpoints (see Table 1).

Figure 1
Most frequently occurring words

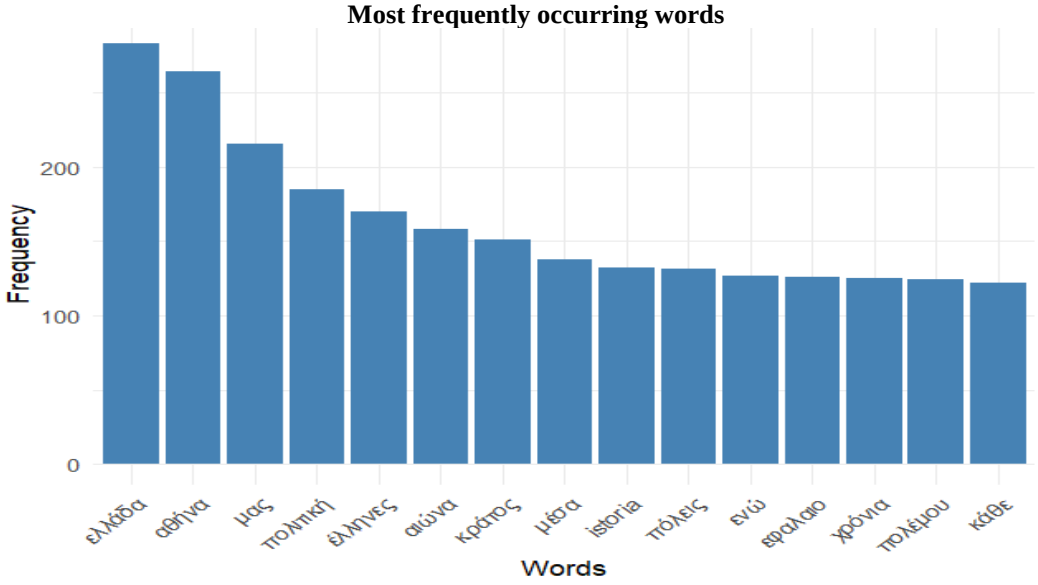

Table 2
Most frequently occurring words and their frequencies

Word	Translated word in English	Frequency of appearance
ελλάδα	greece	283
αθήνα	athens	264
μας	us	215
πολιτική	politics	185
έλληνες	greeks	170
αιώνα	century	158
κράτος	state	151
μέσα	inside	138
istoria	history	132
πόλεις	cities	131
ενώ	while	127
κεφάλαιο	capital	126
χρόνια	years	125
πολέμου	war	124
κάθε	every	122
κράτους	of the state	121
μεγάλη	big	120
εποχή	age	117
μουσείο	museum	117
ιστορία	history	116

Figure 1 and Table 2 illustrate the frequency of the twenty-five most prevalent entries in the body of the texts, revealing the thematic directions and priorities adopted by the history textbook. First, the frequent appearance of the words *ελλάδα* (283 instances) and *αθήνα* (264 cases), which mean Greece and Athens, respectively, indicates a clear emphasis on ethnic and urban references. The primacy of the term *ελλάδα* highlights the text's interest in the Greek nation-state, both as a subject and as the object of the historical narrative. At the same time, the high position of *αθήνα* reflects its symbolic and administrative importance, making it a privileged site of political power and cultural memory. Overall,

the dominance of these toponyms suggests a spatial logic in which the national and urban dimensions are closely intertwined in the context of historical interpretation.

The pervasive recurrence of the possessive pronoun *μας* (215 instances) fosters an inclusive narrative voice, inviting readers to adopt a collective *we* perspective that aligns students with the historical actors and frames events through a shared national lens. Equally salient are political themes: *πολιτική* (185) and *έλληνες* (170) interweave governance processes with the agency of the Greek people, presenting politics not as abstract theory but as lived, communal experience.

Temporal and historiographical preoccupations emerge through high-frequency terms such as *αιώνα* (158), *χρόνια* (125), and *εποχή* (117), which structure the narrative into centuries, years, and distinct epochs, thereby reinforcing a strictly chronological progression. The dual orthographic forms of history, *istoria* (132) and *ιστορία* (116), signal a reflexive engagement with historiography, underscoring the textbook's concern not only with recounting events but also with exploring the theoretical frameworks and narrative strategies underlying historical writing.

Spatial and urban dimensions are equally prominent: *πόλεις* (131), *πόλη* (112), *κράτος* (151), and *κράτους* (121) foreground cities and state structures as loci of demographic change, administrative evolution, and cultural interaction. The term *μέσα* (138) highlights the importance of media and mechanisms that shape public discourse, while connective lemmas such as *ενώ* (127), *κάθε* (122), and *κυρίως* (113) provide syntactic cohesion and underscore thematic priorities. Collectively, these lemmata reveal a carefully constructed narrative architecture, chronologically ordered, nationally centered, and pedagogically oriented to engage students as active participants within a shared historical community (see Figure 1 and Table 2).

CONCLUSIONS

The findings of the present SA study indicate that a neutral narrative tone primarily characterizes the school textbook text. This neutrality is expressed through the systematic emphasis on presenting facts, the clear organization of the historical narrative, and the use of sources, without a strong subjective or emotional charge. This choice is not accidental, as it reflects the pursuit of an objective approach to the historical material and serves the pedagogical context, which requires precision and clarity in presenting historical data to students (Grever & Van Der Vlies, 2017). This methodological neutrality ensures that the narrative remains oriented towards the transmission of knowledge, avoiding possible value judgements that could influence the perception of the facts.

However, the analysis revealed that this neutrality is not absolute and is interrupted when the text refers to traumatic historical periods or catastrophic experiences, such as the Asia Minor Catastrophe. There is a systematic reinforcement of the negative emotional tone, with the authors focusing on the trials, losses, and violent aspects of the events. This negative tone is primarily concentrated in descriptions of refugee flows, warfare, and social consequences, resulting in a narrative that assumes a gravitas and drama, particularly in chapters that address issues of catastrophe and national trauma (Brigham & Elkins, 2024). This choice appears to serve the didactic objective of highlighting the significance of the hardships faced by the Greek populations, making the passions and consequences of historical developments central to the teaching process (Åhsberg, 2024; Repoussi & Kouseri, 2024). Conversely, positive or hopeful references are minimal to brief remarks, such as moments of solidarity, collective recovery, or the prospect of reconstruction. This imbalance between the negative and positive emotional tone suggests that the manual primarily focuses on highlighting the tragic or challenging aspects of historical reality, leaving the reinforcement of optimistic narratives or constructive experiences in the background.

On a lexicographical level, the text is structured around terms that project the ethnic, political, and temporal dimensions of the narrative. The frequent use of toponyms, collective pronouns, and words related to the state, cities, and historical periods reveals a narrative that seeks to integrate the student into a collective national experience and to emphasize the interdependence of history with the evolution of national identity and political institutions (De Cillia et al., 1999). In addition, the chronological organization of the chapters and the emphasis on theoretical frameworks underline the commitment to a systematic and scholarly presentation of the material (Von Münchow, 2020).

In summary, the textbook maintains a predominantly neutral linguistic and narrative approach, which, however, is interrupted by a strong negative tone in sections dealing with traumatic historical events. The limited space for a positive or hopeful tone reflects the authors' choice to present mainly trials and tribulations as central elements of the historical narrative, thus reinforcing the textbook's character as a means of transmitting national memory and collective experience by highlighting the difficulties of the historical journey.

DEVELOPING ORIGINAL TEACHING MATERIAL FOR GERMAN AS A FOREIGN LANGUAGE USING ARTIFICIAL INTELLIGENCE SOFTWARE AND DIGITAL TOOLS

Dr. Rizopoulou Aikaterini
Substitute Teacher of German as a Foreign Language
50th Middle School of Athens
Athens, Greece
e-mail: krizopoulou@gmail.com

ABSTRACT

School textbooks for teaching and learning the German language as a foreign language in Greek public secondary schools are devoid of any accompanying audio material. This presents a particular challenge for German as a foreign language (GFL) teachers and pupils, especially in the first grade of middle school, where the language proficiency level is defined as A1- (Pre-A1), that is below the first basic language level as described in the Common European Framework of Reference for Languages (CEFR).

Although in recent years some efforts have been made by the Institute of Educational Policy (IEP) or by individual educators to create some GFL audio materials and this material is digitally available on the *Photodentro* platform of the National Repository of Educational Material, the number of audios specifically for the Pre-A1 language level remains extremely limited. In many cases, the available material either significantly exceeds the target language level or does not align with the topics covered in the school textbook.

Finding or adapting GFL listening materials and creating suitable listening activities to develop pupils' listening comprehension skills proves to be a challenging task for GFL-teachers. This paper examines whether recent advancements in Artificial Intelligence, particularly the development of Text-To-Speech and Voice-Transformation software, can help bridge this gap in teaching and learning German as a foreign language in Greek public middle schools.

Research over the past decade has shown that various Text-To-Speech software tools can support second language vocabulary learning, while also improving learners' reading skills by functioning as 'out loud readers' of individual words, phrases, or even entire texts. Additionally, empirical evidence suggests that beginner-level foreign language learners, particularly in English classes, seem to remain unaffected by the potentially unnatural prosody of audio files generated by such software.

However, the question arises as to whether Artificial Intelligence can advance foreign language listening skills beyond the phonetic reproduction of isolated written words or sentences. Specifically, this paper focuses on the question, whether such software (in this case, Murf.AI) can be used to generate GFL audio material that sounds as 'natural' as possible and exhibits human-like characteristics. Furthermore, it explores how the final audios can be made available for use — either as audio files in an online classroom (e-Class), or as audio files accompanying a video created with holistic digital and print media creation platforms (such as Canva), or, further, as audio files integrated into a gamification platform (such as Genial.ly).

As a general conclusion, it can be said that current developments in Artificial Intelligence enable the autonomous creation of fairly realistic and adaptable audio material, tailored to the linguistic and learning profile of each classroom, to support and enhance the development of listening skills in foreign language teaching and learning.

Keywords: German as a foreign language, secondary education, listening comprehension, oral comprehension, text-to-speech, foreign languages, artificial intelligence, software.

THE SIGNIFICANCE OF LISTENING COMPREHENSION IN THE CONTEXT OF SECOND LANGUAGE ACQUISITION

In communicative and learner-centered second language (L2) teaching and learning, significant importance is attributed to the ontogenetically primary skills of listening and speaking (see the detailed descriptors for reception and production activities and strategies in the Common European Framework of Reference for Languages (CEFR) (Council of Europe, 2020). Research on the field of first language acquisition has already shown the importance of listening comprehension in everyday communication. As reported by Hedge (2000: 228): "of the time an individual is engaged in communication, approximately 9 per cent is devoted to writing, 16 per cent to reading, 30 per cent to speaking, and 45 per cent to listening" (see also Aguado, 2021: 253; Solmecke, 2010: 969). As far as second language learning is concerned, it is imperative to acknowledge the main role of listening in the development of oral proficiency, and particularly in cultivating an L2 intelligible pronunciation and prosody. It goes without saying, that the production of phonetically and phonologically accurate utterances in a second language is contingent on prior receptive perception of these utterances in L2-speech (Aguado, 2021: 264; Morf, 2022: 66).

The British psycholinguist and L2 listening comprehension didactician John Field (2019: 302) posits: "speech encounters leave long-term memory traces in a listener's mind. The ability to trace phoneme values and word forms in connected speech is linked to the ability to recognize familiar voices, and results from the listener constantly finding analogies between new input and what was heard previously." And he also states that the acquisition of "word frequencies and formulaic chunks" can also be explained in a similar way (ibid.). So, according to Field "[t]he auditory acquisition of phoneme values [and also of word frequencies and formulaic speech, A.R.] seem to depend not upon repetition exercises but upon exposure over time to multiple variants of phonemes and words spoken in **a range of different voices**." (Field, 2019: 302, emphasis added). Consequently, it can be concluded, that listening comprehension in a second language plays a central role in the development of a good L2 pronunciation as well as in the acquisition of L2 vocabulary and syntax.

LISTENING COMPREHENSION IN THE GREEK GERMAN-AS-A-FOREIGN-LANGUAGE (GFL) TEXTBOOKS

The government-issued series of textbooks, which has been used for over two decades for teaching and learning German as a foreign language in public middle and high schools (secondary education), is devoid of any accompanying audio material. Although the individual textbooks – one for each grade – do contain listening comprehension tasks and exercises, which suggests that the teaching textbook series was designed to include listening activities, there are however no audio files for which these activities were originally intended.

Some – numerically very limited – audios for GFL-teaching can be found on the National Repository of Educational Material *Photodentro* (https://photodentro.edu.gr). These audio files are freely accessible and can be downloaded at no cost. In accordance with the teaching guidelines for foreign languages of the Greek Ministry of Education, the utilisation of these files in the GFL-classroom is recommended. However, the majority of this material is either thematically loosely connected to the respective units of the textbooks or linguistically too demanding for the target pupils.

In particular, for the very low Pre-A1 language learning level – the focus of this paper – which, according to the teaching guidelines for GFL-language instruction, should be achieved in the first grade of middle school, I was able to find only five audio recordings that can be linked to the topics covered in the textbook units. These audios are titled 'My Family', 'Professions' (Parts 1 and 2), 'In the school newspaper', 'This is me' and 'Music'. Irrespective of the listening activities in which the individual audio files can be employed in class (see CEFR, 2020: 50-54), the following section briefly discusses their thematic relevance to the textbook units as well as their linguistic difficulty.

THE THEMATIC RELEVANCE OF GFL-AUDIOS AVAILABLE ON *PHOTODENTRO* TO THE UNITS OF THE GFL-TEXTBOOK IN THE FIRST GRADE OF MIDDLE SCHOOL

Of the five available audio files, only two are closely linked to thematic aspects of the textbook units (namely 'Professions' Parts 1 and 2, and 'Music'). The remaining audios were created according to the principle 'one audio for all textbook chapters', as they contain text passages that are thematically aligned with different textbook units. Consequently, it is up to the GFL-teachers to edit the audio files themselves and divide them into multiple sub-files relevant to the topics of each unit, should they wish to use them in the classroom.

THE LINGUISTIC DIFFICULTY OF THE GFL-AUDIOS AVAILABLE ON *PHOTODENTRO*

If one were to place the audio files available on *Photodentro* on a continuum ranging from a) pattern-drill-shaped and strongly computerized, over b) scripted and performed by (near-)native speakers to c) improvised (?) and performed by native speakers, then the audio files 'My family' and 'Professions' (Part 1) are strongly computerized. In all likelihood, they were created using an older generation text-to-speech synthesiser. The language employed in both of these files is straightforward and should theoretically be familiar to learners when engaging with the corresponding textbook units. However, both texts demonstrate a pronounced pattern-drill form, employing the same syntactic structure throughout the listening texts (e.g. "This is my father. He is a computer scientist. This is my mother. She is a medical practitioner", and so forth for the audio 'My family'. Or: "This is Luis. Luis is a reporter. This is Max. Max is a footballer.", etc. for the audio file 'Professions', Part 1). It may also be worth pointing out, that the name *Max* appears in three of the total eight items of the audio text 'Professions' (Part 1), making the creation of at least one mismatching task impossible. Furthermore, it could also be noted, that the audio entitled 'Professions' (Part 1) exclusively features male job titles, despite the fact that the textbook is also incorporating female forms of job titles.

The audio 'In the school newspaper' is a didactically constructed (scripted) interview with a (near-) native young female pupil. With the exception of the fact that the interview is presented at a relatively high speaking speed for the Pre-A1 language level (see CEFR, 2020: 48), the language in this audio is also simple and already familiar to the learners. Furthermore, it does not exhibit any characteristics of natural (authentic) speech, which could raise its difficulty.

In the audio file 'Professions' (Part 2), a middle-aged female native German speaker, who – according to the script – is a school teacher by profession, introduces herself in a monologue. She briefly talks about her place of residence and her family and mentions the school subjects she teaches. The short scripted monologue is spoken at a slow pace and, apart from two unfilled pauses for thought, has no other features of authentic speech, whereas only two new words, not yet introduced in the schoolbook, appear in the text. However, in the pre-listening phase, the teacher has to introduce some information to the pupils about the neighborhood of *Berlin Rudow* and the school subject of *ethics*, which appear in the audio text, in order to support learners' understanding of the text content.

In the audio file 'Das bin ich', a female teenager, native speaker of German, introduces herself. Although being delivered in a slow pace, the scripted monologue exceeds the language learning level to be achieved, as many L2 forms, that have not yet been introduced in the school textbook, appear in the text (such as adjectives in the comparative, modal verb *möchte* + infinitive, several phrases like *ich bin geboren*, *in der Zukunft*, *in einer kleinen Stadt*, *an der Ostsee*). There is also a need for explanation with regard to regional information (the city of *Wismar* in the federal state of *Mecklenburg-Vorpommern* on the Baltic Sea). Furthermore, the audio is characterised by many features of authentic speech, such as filled and unfilled pauses, delays and hesitations, assimilations, elisions and sound variations (Aguado, 2021: 255, 256).

In my opinion, the most 'authentic' sounding audio file is the one entitled 'Music'. This is another monologic text in which an adult musician talks about his music preferences, his band and the musical instruments he can play, among other things. The speech rate differs greatly within the audio (sometimes the 'musician' speaks faster, sometimes slower) and the audio recording contains in several places pauses, assimilations, elisions and modal particles, which make it difficult to understand at the Pre-A1 language level. The biggest problem, however, seems to be the language of the monologue, because there are far too many difficult L2 forms in the text that do not correspond to the CEFR's Can-Do descriptors at the Pre-A1 level (such as the superlative, temporal subordinate clauses with *if*, the progressive with *am*, the temporal preposition *bei* + dative, adverbs of frequency). Technical editing to cut out the linguistic challending parts is recommended, if GFL-teachers want to use this audio in class.

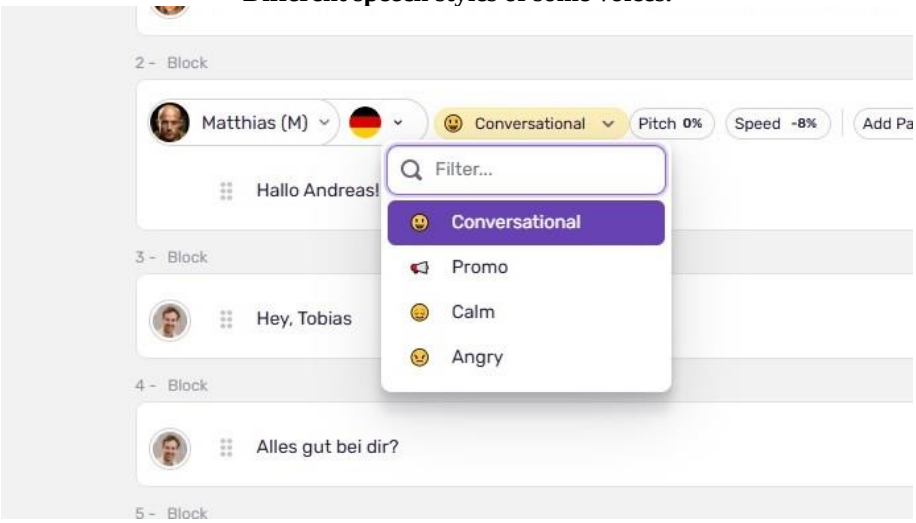
To summarise, it can be said that the audio files available on *Photodentro* for the Pre-A1 language level are firstly far too few and secondly not always well calibrated thematically and/or linguistically, which means that GFL-teachers have to carry out the technical text editing themselves, if they wish to use these audios in class. This raises the question of what other alternatives are available to GFL-teachers to promote listening comprehension in their GFL-classes on this early language level.

In my mind, GFL-teachers in Greek public middle schools are left with the following options: They can either omit listening activities all together, or they can use listening material from GFL-textbooks that are available commercially (see also Morf, 2022, who reports similar findings). The use of already existing listening materials from GFL-textbooks available on the market has the advantage that the audios meet the linguistic requirements of the Pre-A1 language level, but at the same time the linguistic progression of many of these audios does not always match that of the

school textbook. From personal experience, I can also say that it is usually difficult for pupils to follow the plot in many of these audios due to the changing protagonists in the various commercially available textbooks.

Another possible alternative would be to use authentic audio (or audio-visual) material, like TikTok-Videos, Youtube-Videos, German songs, advertisements, scenes from soap operas, etc.. The authentic material of this kind has the advantage of being more interesting for the pupils, but at the same time it is linguistically too demanding for the lower language levels and therefore not easy to understand, since it is created for native (or at least very competent) language users.

Therefore, I decided to use AI and, more precisely, Text-To-Speech technology to create suitable listening comprehension audios for my classes at the Pre-A1 language level. In the following, I will first explain what Text-To-Speech (TTS) technology is and then summarise the most important empirical findings of second language acquisition research on the use of this technology in – mainly – English as a foreign language classes.



TEXT-TO-SPEECH (TTS)

TTS technology "is a type of assistive technology that reads a digital text aloud" (Al-Jarf, 2022: 19). According to Moon (2012: 121), TTS technology "was originally developed to help visually impaired people read text on the computers". The first TTS synthesizers provided low quality speech output with a highly computerised voice, but this has changed over the years with advances in technology. Nowadays, there is a plethora of free or paid TTS software programmes (apps and platforms) available.

Empirical studies on the use of TTS software in English as a foreign language classes have shown that L2 learners who read a text and have it simultaneously read to them by a TTS programme, can learn the correct morpheme-grapheme associations of L2 words more effectively. This has an impact on both their writing and reading skills (i.e., fewer spelling errors, correct L2 pronunciation, developed reading fluency, accuracy, rate and prosody) and on their L2 vocabulary knowledge (see for example Al-Jarf, 2022; Amin, 2022; Rodrigues-Bonces, 2019). Empirical evidence also suggests that the sometimes unnatural prosody of audios generated by TTS software (e.g., lacking emotions or native rhythm in phrasal stress, intonation and pauses) does not seem to affect learners' understanding of the audios, especially for beginner-level foreign language learners of English (Cardoso et al., 2015; Mulyono and Vebriyanti, 2016; Rodrigues-Bonces, 2019; but see also Bione et al., 2016).

After a short internet research, I decided for the following reasons to use the paid platform Murf.AI (https://murf.ai) in its Standard pricing plan: Firstly, it is one of the few TTS platforms that has many female and male German-speaking voices. Secondly, the style of speech of some voices can be altered (see Image 1).

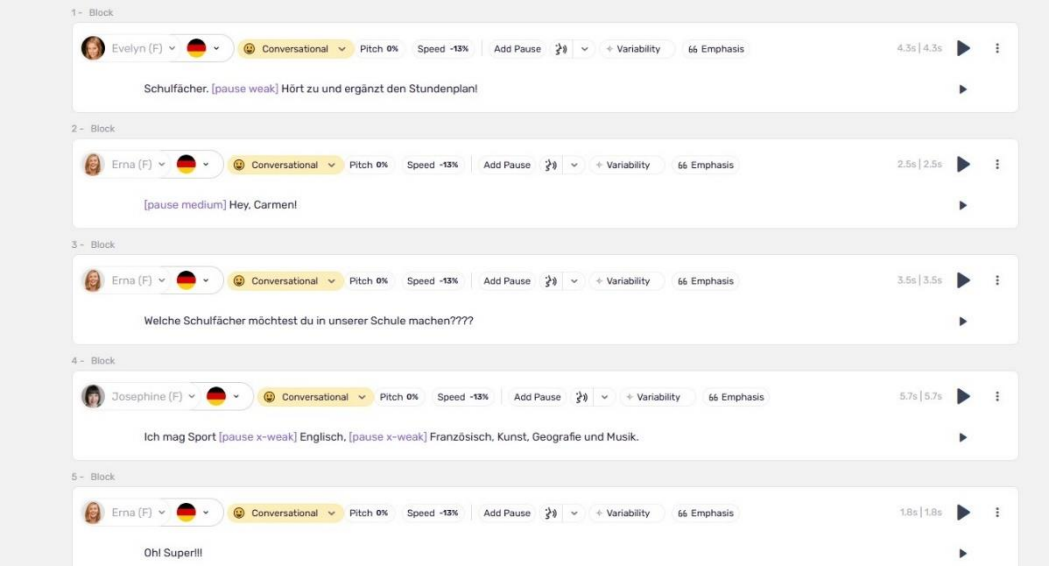


Image 1
Different speech styles of some voices.

Thirdly, Murf.AI is characterised by a very user-friendly studio-editor (see Image 2), that enables the creation of multi-actant audios by inserting a separate track for each 'speaker' or voice. Fourthly, the studio-editor also allows the

segmentation of utterances or units of meaning. Fifthly, pauses of different length can be inserted into and between utterances, while the speed of speech can also be adjusted.

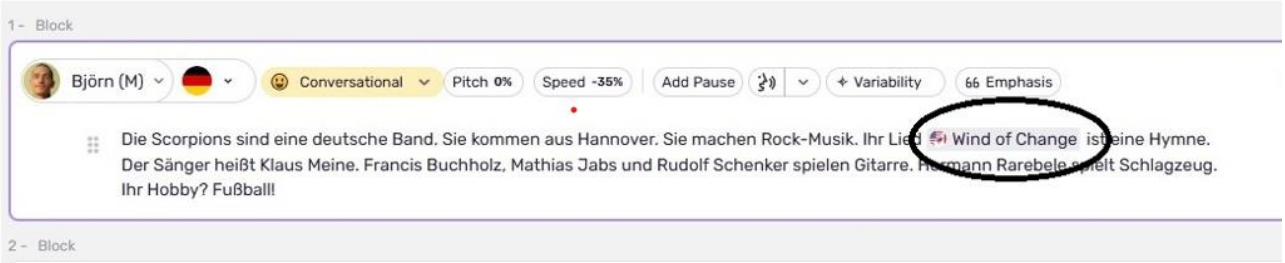

Image 2
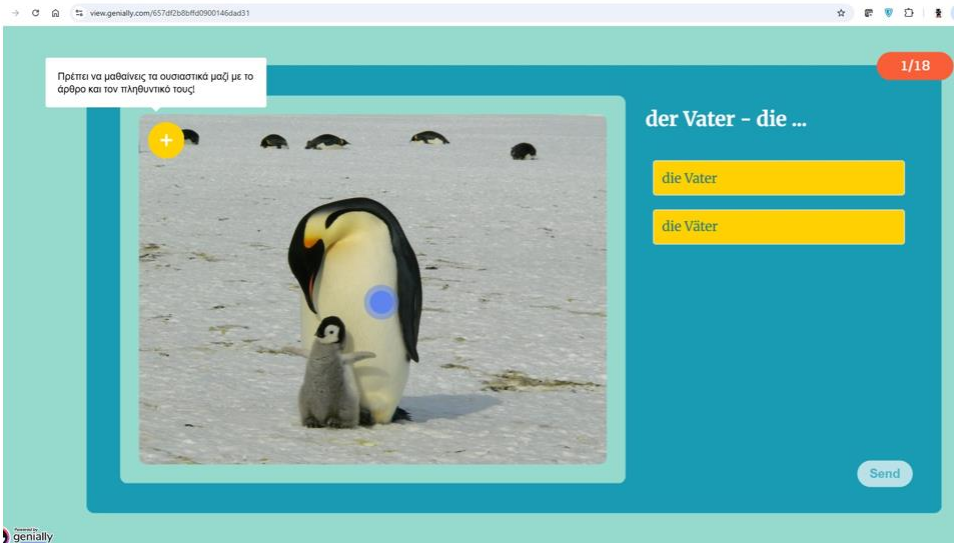
The studio-editor of Murf.AI

Sixthly, the platform allows code-switching by adapting the pronunciation of selected words or utterances to the phonetic-phonological conventions of other languages apart from German (Image 3).

Lastly, the audio files created with Murf.AI can be downloaded in MP3 or WAV format and so they can easily be used in the foreign language classroom.

Image 3
Code-Switching on Murf.AI studio-editor



Using this TTS platform, I was able to create audio files for typical L2 listening comprehension activities (what Field 2019 calls the *Comprehension Approach*) as well as numerous audios that were used to develop smaller listening exercises. Some examples of the creation of such audio files at the Pre-A1 language level and of their use in GFL teaching and learning are presented in more detail below.

CREATING GFL-LISTENING COMPREHENSION MATERIAL FOR THE PRE-A1 LANGUAGE LEVEL

Research in L2 listening comprehension has shown that foreign language listeners do not always succeed in recognising an L2 word, that they already know in its written form, as a sound form in a stream of speech. Grotjahn (2005: 122) calls this "insufficiently developed listening vocabulary" [translation from German, A.R.]. To deal with this, audio files of individual L2 words were created to familiarise GFL-pupils with the phonetic form of newly introduced L2 vocabulary. This is what Cauldwell (2018: 18) metaphorically refers to as the "Greenhouse speech style": "It is the form given in the pronunciation key of a dictionary. The word is preceded and followed by a pause and every segment and syllable is carefully articulated".

These ‘greenhouse’ audio files were used in two ways: Firstly, they were uploaded to the e-Class (https://eclass.sch.gr) and thus made available to the pupils for autonomous learning and consolidation of the newly introduced L2 vocabulary at home. Secondly, they were integrated into interactive exercises on the gamification platform Genial.ly (https://genially.com), so that the pupils could get better familiarized with the phonetic *and* written form of the new L2 vocabulary while solving those interactive exercises (Image 4).

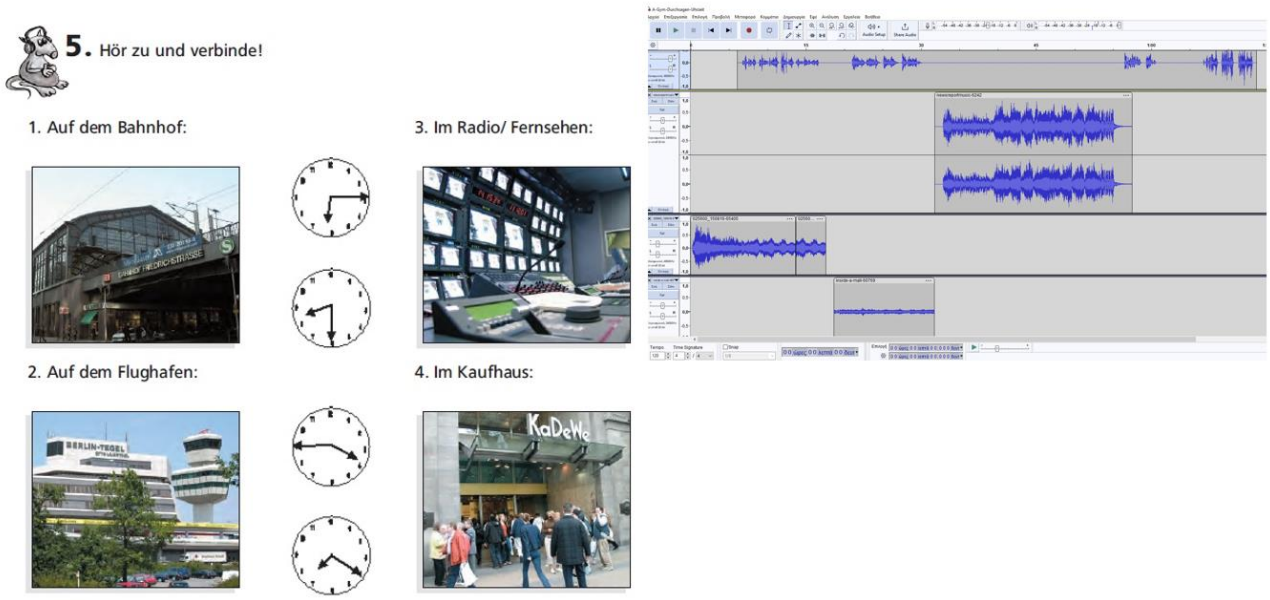


Image 4.
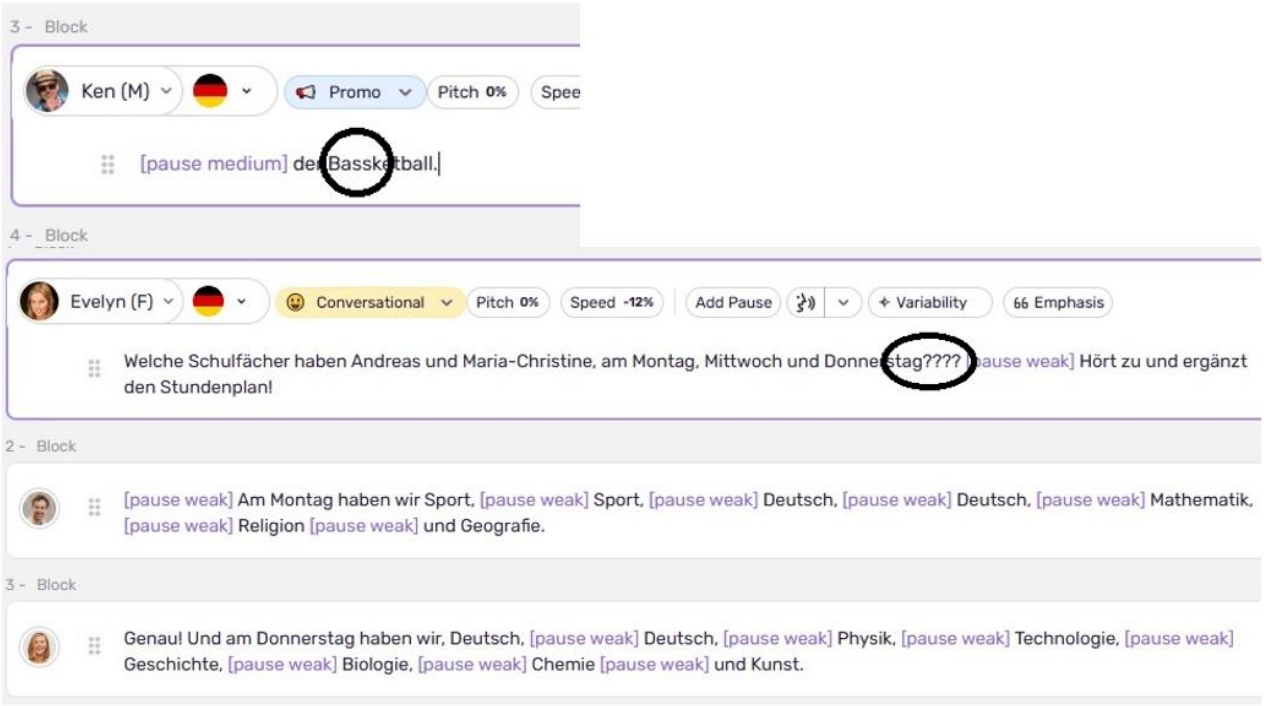
Example of interactive exercise on Genial.ly with integrated audios.

Furthermore, I used the TTS platform as a reading device for longer monologues or dialogues of the textbook. The audio files created in this way were used both in the classroom and also uploaded to the Genial.ly platform, which was then used to create true-false listening activities based on the content of the texts.

With Murf.AI, I was also able to create audios for many of the listening comprehension tasks in the school textbook. To make the communication situations in which the listening tasks were embedded sound even more natural, I enriched the audios with natural (and license-free) sounds from the Pixabay digital library (https://pixabay.com). And in order to cut and edit the audio files, I used the freeware programme Audacity (https://audacityteam.org) (Image 5).

Image 5.
Creating audios for listening comprehension tasks in the textbook.



Because many of the listening texts in the school textbook (which only appear as transcripts in the school book), were considered linguistically too demanding for the intended learner audience, I rewrote (re-scripted) the listening comprehension texts, created audios of them by using Murf.AI and developed new listening comprehension tasks. The new work sheets were created using the graphic design platform Canva (https://www.canva.com).

Last but not least, I also created short videos for some of the listening texts using Canva by integrating the created audio files into videos. It is important to note that these videos only contain still images of the protagonists and a few keywords relating to the respective topic of the audio files (see Image 6), since studies have empirically shown that L2 comprehension of audio recordings with still pictures or of audio recordings alone is much better than that of videos (Field, 2019: 299).

Image 6.
Video with integrated audio using Canva.

Image 7.
Efforts to improve the speech output.

CONCLUSION

The first and most important conclusion that can be drawn from using the TTS platform Murf.AI to create audio material for my Pre-A1 classes in Greek middle schools, is that it has helped me address the lack of listening

comprehension material in the government-issued textbook. This made, thus, the inclusion of listening comprehension activities related to the textbook possible.

I also noticed that my pupils' motivation was boosted, because the audio files created were tailored to their linguistic needs and abilities. To this contributed the clear and comprehensible standard pronunciation and prosody of the German-language voices of Murf.AI, as did the simplified language of the listening texts, which was adapted to the requirements of the CEFR (see also the didactic-methodological principle of Success Orientation of L2 Tasks and Exercises explained in Funk et al., 2014: 18).

It is undisputed that the selected TTS platform has some of the typical shortcomings of any TTS technology, that are well documented in the relevant literature (see, for example, Bione et al., 2016; Cardoso et al., 2015; Sha, 2010). However developed such new-generation TTS software may be, the suprasegmental language level (e.g. sentence intonation, native rhythm in phrasal stress and pauses, lack of emotions) has suffered in many cases, despite my efforts to compensate for it with the use of additional punctuation marks, extra pauses, or even changes of the spelling of individual words, in order to improve the speech output (Image 7).

Nevertheless, I remain confident, that with the further development of AI, TTS technology will also improve, making it a valuable tool in the hands of L2 teachers.

ADOLESCENTS' PERSPECTIVES ON ELECTRONIC GAMES

Elpida Christoforidou
PhD of the Department of Fine Arts and Sciences of Arts, University of Ioannina
Larissa, Greece
e-mail: mauve2310@yahoo.gr

ABSTRACT

"There are some games that teach you how to become a better person." This was the statement of a thirteen-year-old participant in of a study conducted between 2021 and 2022, which aimed to research the cultural and socio-political dimensions of engagement with electronic games within adolescent culture. One of the research objectives was to explore adolescents' views on the value of electronic games, while another question that arose was whether and to what extent electronic games shape models of action and thinking in young people.

The research, which involved adolescents aged 12-17 from the Municipality of Thessaly, was divided into two parts. In the first stage, 485 questionnaires were collected from secondary schools in the region of Thessaly, which were analyzed using SPSS. In the second stage, 42 semi-structured interviews were conducted, for which thematic analysis was carried out.

According to the results of the research, electronic games represent a modern form of entertainment for children, a space for socializing with friends, an anxiety-relieving setting, a place for learning and raising awareness about various socio-political issues, and a means of self-improvement. Additionally, for some teenagers, electronic games were evaluated as artistic creations of equal value to a film, a music piece, or even a painting. In their view, a videogame has value for various reasons, such as its aesthetic properties (graphics, story, music), the intensive work involved in its creation, its ability to fulfill various needs (entertainment, relaxation, learning, challenges, creativity, social interaction, etc.), its connection to reality, and its mentoring, such as giving lessons of survival. The element of 'survival' fascinates adolescents, and one reason for this attraction lies in the opportunity to create a society from scratch.

McGonigal (2010), a video game designer, argues that electronic games are an inventive platform for changing the world and that within the game, children become the best version of themselves, developing a social network, building confidence, and engaging in meaningful activities that bring them pleasure. Indeed, these thoughts are reinforced by the results of the present research. The world of videogames forms a second parallel world, where adolescents, as members of a group, solve problems, create and/or try to improve things and situations – something that gives meaning to their actions – and have, consciously or not, various gaming socio-political experiences that encourage them to change things for the better.

Keywords: electronic games, adolescents, value, representations.

INTRODUCTION

In recent years, education has increasingly embraced interactive and experiential methodologies. One prominent tool employed across various fields of knowledge is the electronic game, designed to engage students, foster emotional involvement, and promote active participation in the learning process (Anskima and Vakimento, 2015). Game designer Jane McGonigal (2010) contends that electronic games represent an innovative platform with the potential to bring about transformative change. Within this parallel world, McGonigal notes, young people build social networks, develop self-confidence, engage in meaningful and enjoyable activities, and strive to become the best version of themselves. She argues that appropriately designed games cultivate individuals who believe in their capacity to effect change—at the very least, within digital environments.

These arguments are supported by findings from a research study conducted between 2021 and 2023, as part of my doctoral dissertation at the Department of Fine Arts and Art Sciences at the University of Ioannina, under the supervision of Professor Christos Dermentzopoulos. The title of the dissertation was: *Adolescent Culture, Electronic Games, and Socio-Political Education*.

RESEARCH METHODOLOGY

The primary of this research was to study popular culture within the context of adolescent culture, focusing specifically on the cultural and socio-political dimensions of engagement with electronic games[1], as articulated by adolescents in the Municipality of Thessaly. The participants were adolescents aged 12 to 17 living in the Thessaly region.

One of the central research aims was to explore adolescents' perceptions of the value of electronic games. A key question that emerged was whether, and to what extent, video games contribute to shaping adolescents' models of thought and behavior.

A mixed-methods explanatory research design was employed, comprising two phases. In the first phase, data were collected through a questionnaire, which demonstrated high reliability, with most Cronbach's alpha values ranging from 0.7 to 0.9—indicating that the instrument effectively captured a broad spectrum of perspectives (Skordoulis, 2020; Taber, 2018). The sample was selected via cluster sampling. Initially, 12 secondary schools in the Thessaly region were randomly selected (subject to their consent), followed by random selection of classes within these schools. A total of 485 valid questionnaires were collected, enhancing the study's validity and minimizing sampling error (Creswell, 2011). The data were analyzed using SPSS statistical software.

The second phase consisted of 42 semi-structured interviews conducted with adolescent gamers to investigate specific themes in greater depth. This included 29 individual interviews and two focus group discussions involving 6 and 7 participants, respectively. Participants were selected using purposive sampling based on key criteria: age (12–17 years), gender (ensuring balanced representation), geographical distribution (with participants drawn from various areas within the Larissa Prefecture), and social background (to ensure diversity). The interview data were analyzed using thematic analysis to derive meaningful insights.

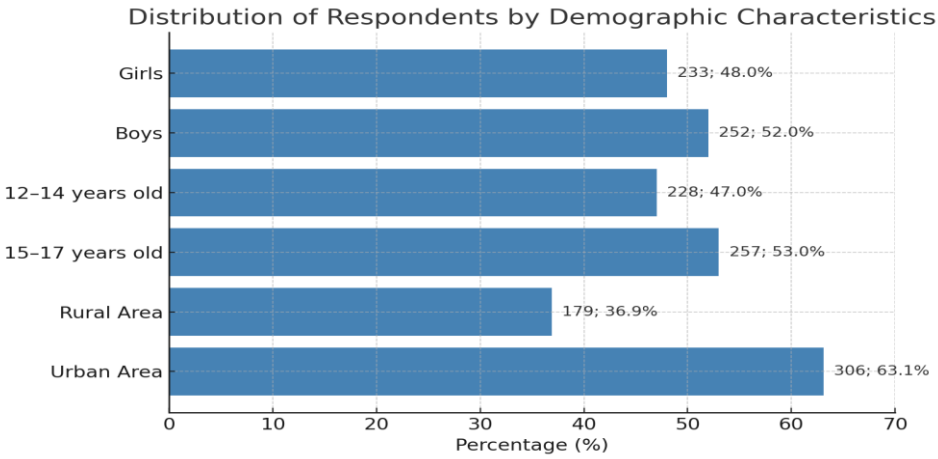
ADOLESCENTS' REPRESENANTIONS OF ELECTRONIC GAMES

Regarding the demographic profile of the participants in the first phase of the study, the sample consisted of 233 girls and 252 boys. Approximately half of the participants (49.5%) were enrolled in general public schools, while 26% attended experimental public schools. Additionally, 13% were students at vocational technical high schools, and 11.3% attended private schools. A majority of the participants (63.1%) resided in urban areas, while 36.9% came from rural regions. The sample also included 228 lower secondary school (gymnasium) students and 252 upper secondary school (lyceum) students (see Figure 1).

The majority of the adolescents identified as electronic game players – 418 out of 485 participants. Among them, 36.9% were girls (179 out of 418) and 49.3% were boys (239 out of 418) (see Figure 2).

[1] The terms *'electronic game'* and *'videogame'* have been deliberately chosen to be used interchangeably and as synonymous, referring to any type of interactive entertainment software (on computer, console, mobile device, or the internet.

Figure 1
Profile of the participants



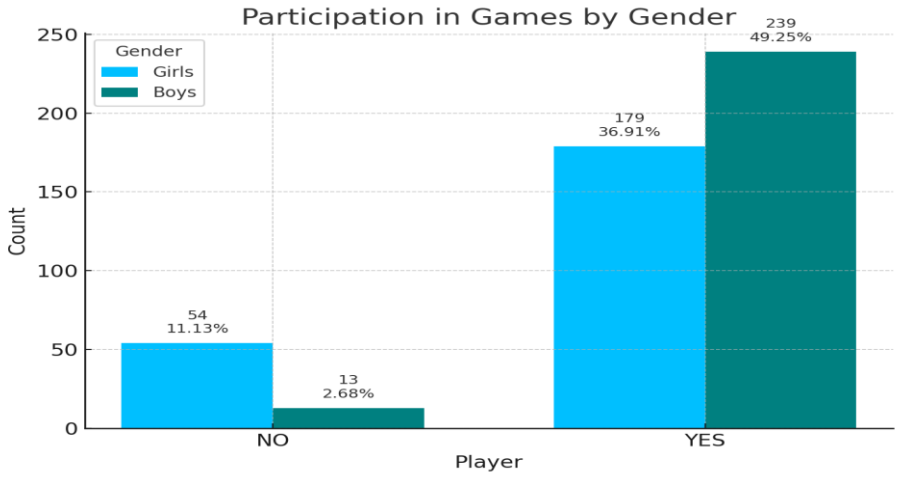


Figure 2
Numbers of players by gender

As evidenced by the findings of this study, electronic games function as a form of "third place" – a concept originally introduced by Oldenburg (1989, p. 16) to describe informal, pleasurable spaces characterized by playfulness and equality among participants. Adolescents perceive videogames as such a space: a source of enjoyment and social interaction with friends, an opportunity for relaxation and escape from the stressors of daily life, a means of self-improvement – as one 13-year-old participant stated, “There are some games that teach you how to become a better person” –, and a platform for learning and raising awareness about various sociopolitical issues. Even through violent video games such as *Grand Theft Auto*, adolescents reported gaining knowledge or developing critical reflections on issues such as social inequality and racism.

Building on this perspective, adolescents are captivated by a range of features within videogames, including graphics and visual effects, characters, music, stories, challenges, expansive worlds to explore, and opportunities for social interaction. They also value the potential of games to inform them about sociopolitical issues, as well as their intertextual connections with films, television series, or/and comics. A particularly appreciated element is the ability to intervene in the plot development, with videogames often serving as immersive experiences in which players feel empowered to shape the progression of events.

In line with these preferences, adolescents’ perceptions of a videogame’s value were often associated with its aesthetic and narrative qualities, including impressive graphics, emotionally evocative music, dynamic and non-static characters, and a compelling, often multi-layered narrative, particularly when conveying meaningful messages, as

exemplified by titles like *The Last of Us.* In addition, a videogame's value was linked to its popularity, encompassing factors such as positive critical reception, a large player base, sustained relevance, and potential for transmedia storytelling. Some adolescents also referenced economic factors: the game's price (with the assumption that a higher cost may indicate higher quality), the potential for financial gain through competitive gaming, the intensive labor involved in game development, and its connections to other art forms or literary works (for instance, those inspired by *The Odyssey*).

Electronic games were also evaluated based on the needs they fulfill, a correlation which aligns with the *Uses and Gratifications Theory*. This approach, which began gaining traction in the 1960s, conceptualizes how individuals use media, viewing users as active agents who select, control, reject, and often resist media content (Maletzke, 1991). Central to this approach is the idea that audiences selectively expose themselves to media and content that satisfy specific psychological and social needs within the context of their lived experiences (Serafetinidou, 1999). Adolescents identified a range of needs met through videogames, including stress relief, relaxation, emotional safety, entertainment, social interaction, the pursuit of achievement, self-validation, creative expression, and opportunities for learning. In this context, learning was not limited to formal knowledge acquisition but extended across multiple domains, encompassing the development of critical thinking, problem-solving abilities, and creativity. These elements collectively contribute to adolescents' sense of self-worth and personal growth (Winnicott, 2019). For instance, in *Cities: Skylines*, players are tasked with developing a city according to their own standards and imagination, while taking into account the needs of citizens, environmental factors, and other indicators, all of which the player must consult (Georgiadis, 2015).

Additionally, the value of videogames was also tied to their realistic or historically grounded content. *Assassin's Creed Valhalla*, for example, immerses the player in the year 873 AD, delving into the history of the Vikings and their violent expansion into England (Moshonas, 2020). Similarly, *Life is Strange* features two female protagonists and addresses socially relevant issues such as gender-based violence and homosexuality.

A particularly compelling theme that emerged was *survival*, which resonated strongly with adolescents and fostered a sense of empowerment and self-confidence. This theme manifested in two primary forms: *collective survival*, which emphasized cooperation, and *individual survival*, where players independently faced uncertainty and complexity. In *Frostpunk*, for example, players lead a community in post-apocalyptic 1886 North America, confronting harsh climatic conditions and making ethically significant decisions (Moshonas, 2018).

Electronic games reflect societal values, concerns, and anxieties, with the survival element acting as a cultural byproduct of contemporary existential challenges. Within the fantasy of survival, players are often confronted with various representations of death (such as pandemics that transform people into zombies) and are compelled to endure. In this context, survival becomes a symbolic value, functioning as a springboard for envisioning improved living conditions, restoring purpose, and resisting the despair that can overwhelm the human condition (Konstantopoulou, 2020).

This issue was examined in greater detail during the second phase of the research through qualitative interviews, which led to the emergence of four thematic categories explaining the appeal of survival elements to adolescents. The first category concerns *emotional intensity and adrenaline*. While playing, adolescents remain in a constant state of alertness. As one participant noted:

"The *Ghost of Tsushima* is exciting because it has Viking graphics, and, you know, you crawl through grass, hide, fight… you get passionate, get addicted, and say, 'I need to win, I need to finish this game!' And when a game has a good story, you want to continue to see what happens in the end. Otherwise, you get frustrated!" (Aphrodite, 15 years old).

The second category involves *experimentation*. Adolescents test themselves in various situations, think of solutions, and explore what they can do on their own:

"The fear of losing makes you want to play and worry, thinking about the best ways to succeed and survive", (Achilles, 16 years old).

The third category relates to the *life lessons* drawn from the fantastical scenarios presented in videogames. These experiences function as hypothetical simulations in which players consider "what if?" scenarios. Successfully overcoming adversity in virtual worlds beyond the bounds of civilization allows adolescents to believe they are better equipped to face problems in the real world:

"From survival games like *Minecraft*, which is my favorite game, I went with my cousins and brothers to a mountain in my village, and I believe I could survive alone there because of what I learned from the survival games" (Christos, 13 years old).

The fourth category focuses on the *creation of a new society*. These videogames are often set in dystopian environments that require players to rebuild, collaborate, and innovate. A prominent example is *Minecraft Survival*, an open-world game that encourages creative problem-solving and community building. The ultimate goal is to defeat the Ender Dragon, the dominant force in the virtual world known as "The End." In doing so, players lay the foundation for a new, safe society:

"I believe the real goal in *Minecraft*, apart from freeing this town I mentioned, is to create your own society in a way. That is, to build an entire world" (Stefanos, 13 years old).

The research also revealed that adolescents often experience various socio-political situations during gameplay, such as decision-making, organizing/managing teams, collaborating, exploring social issues, guiding other players, obtaining information about a social problem, and reflecting on ethical matters. Moreover, one of the key findings was a statistically significant relationship between adolescents' engagement with socio-political elements in gameplay and the manifestation of corresponding attitudes and behaviors in real life. These results suggest that gameplay experiences of a socio-political nature may contribute to real-world civic awareness and participation. As Dewey (2016) argues, repeated educational experiences lead to learning, which in turn fosters the development of responsible and engaged global citizens.

CONCLUSION

Electronic games represent one of the most popular – yet simultaneously controversial – forms of entertainment for children and adolescents today. Traditionally associated with negative stereotypes such as social isolation and the promotion of violence, videogames have, in recent years, been reevaluated for their potential to foster education, social development, and emotional intelligence in young people.

Adolescents who engage with videogames often inhabit a *liminal space* between reality and fantasy (Winnicott, 2019), where they experiment with identities, confront personal and societal concerns, and engage critically with real-world issues. Within this "artificial paradise" – a term coined by McLuhan (1990) to describe the immersive and transformative potential of game – players encounter complex socio-political themes that contribute to their emotional and cognitive maturation. This space allows adolescents to imagine alternative futures, challenge dominate narratives, and explore new worlds, both *imagined* (those constructed by game designers or co-created through player interaction) and *imaginary* (which exist solely within the individual's imagination and remain unrealized within the game environment) (Godelier, 2020).

Videogames that incorporate moral dilemmas and high-stakes scenarios, such as *The Last of Us* or *Minecraft Survival*, offer players opportunities to navigate difficult decisions, while simultaneously developing emotional intelligence and ethical reasoning. In these post-apocalyptic digital environments, players are often called upon to reconstruct political communities, economic systems, and moral frameworks – in essence, to *reimagine society*. As Farca (2018) observes, dystopia in videogames is inherently utopian, as it invites players to reflect, question, and experiment with alternative social models. Notably, when adolescents who engage with such videogames were asked to define "society," many expressed visions of a more just and inclusive world, where diversity, harmony, and cooperation are central values.

Adolescents dream of a better world, and videogames provide a meaningful space in which to explore what is truly important for humanity. Through play, they learn, reflect, and evolve – provided that this engagement occurs under specific and supportive conditions. The interactive nature of videogames promotes enjoyment and immersion. As Harari (2022) suggests, pleasure – particularly when embodied – contributes to human happiness at a biological level. In parallel, the deep focus and *flow* (Banks & Wasserman, 2019; Markey, Ferguson & Hopkins, 2020) fostered by gameplay distinguish videogames from more passive media forms such as film or television.

As Jenkins (2006) compellingly argues, videogames may well be laying the groundwork for a more engaged and participatory political culture ; one that begins not only in the streets or classrooms, but also in the virtual worlds where today's youth are already imagining, experimenting, and striving for change. In this light, electronic games are not merely tools of distraction – they are platforms for exploration, transformation, and ultimately, hope.

ABSTRACT

This paper presents the implementation of a comprehensive action plan for the modernization of the school library, aiming to foster learning, creativity, and both digital and traditional reading literacy. The initiative went beyond the renovation of the physical space, focusing instead on the creation of a multifaceted and functional learning environment that integrates digital and traditional infrastructures, advanced technological tools, and collaborative teaching practices. The project was carried out with the active participation of students, teachers, and external partners, with the overarching goal of transforming the library into a dynamic hub of knowledge, innovation, and social interaction.

The main outcomes include the development of original educational and audiovisual material, the design of interactive reading promotion programs, the establishment of partnerships with cultural and academic institutions, and the integration of the library into national and international networks for the exchange of good practices. Evaluation was conducted using a combination of quantitative and qualitative criteria, such as community participation, quality of collaboration, completion of activities, use of digital resources, and user satisfaction. The results highlighted the potential of school libraries as multidimensional learning spaces that meet the demands of the 21st century, enhance digital literacy, and function as hubs of social participation and innovation.

Keywords: Digital literacy , Information literacy, Educational digital tools, Hybrid libraries, Knowledge dissemination, Technological innovation, Sustainability of practices.

INTRODUCTION

The school library is today a multidimensional and dynamic learning space, which goes far beyond the traditional role of collecting printed material. In modern educational environments, the library integrates digital technologies and creates opportunities for new forms of interaction, accessibility and collaboration. Through this process, information skills, autonomy in learning, critical thinking and digital literacy are promoted (Hasibuan, Fadhli , & Igiriza , 2023).

The concept of a "hybrid library" allows for the coexistence of traditional and digital collections, while simultaneously providing access to digital resources online. Literature demonstrates that well-staffed and equipped school libraries are associated with improved student performance in language arts, science, history, and mathematics (Lance & Kachel, 2018; Center for American Progress, 2020; Teravainen & Clark , 2017). In addition, libraries function as a "third space" of learning, where students can develop skills beyond the conventional classroom context and engage in creative activities (McDougal, Garcia, & Evans, 2023).

Reading for pleasure and active participation in library activities are directly linked to students' psychosocial development, enhancing their self-confidence and well-being (Cremin & Coles , 2023). At the same time, digital transition is a critical factor for the sustainability and effectiveness of school libraries, as digital tools facilitate immediate access to resources, recording and managing material, as well as the development of digital skills of staff (Vrana , 2017; Oliveira Ramos, Costa, & Silva , 2022).

The aim of this article is to present the implementation of a comprehensive action plan for the organization and modernization of the school library, with an emphasis on learning, reading and the dissemination of knowledge, highlighting its multidimensional function as a space for creativity and collaboration.

ACTION PLANNING

The need to modernize the school library arose from the desire to create a space that meets modern educational requirements, promotes reading and enhances access to various types of material. The action plan included the detailed design of the space, the classification of the material according to the Dewey system , electronic recording in the biblionet.gr database and the creation of an electronic archive in the Panhellenic School Network. At the same time, a lending system with membership cards and electronic book management was organized, while the placement of the books was based on thematic categories and classification number, in order to facilitate access and search.

One of the most important innovations was the creation of a Digital Library, with access to various digital resources and connection to the myLib.gr network, expanding the reach and exchange of good practices with other school units. At the same time, internal operating regulations were drawn up with the participation of students and teachers, in order to strengthen the sense of responsibility and participation in the library.

The objectives of the action plan included the development of original educational materials through collaborations, the promotion of reading through digital tools, the dissemination of knowledge and innovation to the wider community, and the connection with library networks for the exchange of good practices (Hasibuan et al ., 2023; Amin & Rahman, 2023). The school library was approached as a dynamic learning organization, where tradition is combined with modern technology and pedagogical innovation.

ACTION IMPLEMENTATION SCHEDULE

The action for the digital and functional upgrade of the school library was implemented throughout the school year and was organized in phases with a clear chronological sequence.

Months 1–2: Planning and recording needs of the school community. Conducting questionnaires and interviews with students and teachers to record their preferences and needs.

Months 3–6: Organization and recording of the existing library, classification of the material based on the Dewey system and creation of digital infrastructure, including an electronic catalog and a digital database.

Months 7–8: Production of multi-format material and development of digital reading programs , such as videos, podcasts and audiobooks , as well as creation of educational activities for students.

Months 9–12**:** Dissemination of the material to schools, cultural and academic institutions, evaluation of the action, improvement of processes, and preparation of final reports and presentations for the school community and external partners.

The timeline ensured a gradual, organized and sustainable transition from the traditional to the modern digital library, enhancing both learning and social interaction of students.

IMPLEMENTATION OF THE ACTION

The implementation of the action was organized in two phases with the aim of a smooth transition from the traditional to the digital nature of the library. In the first phase, emphasis was placed on strategic planning, recording the needs of the school community and creating basic infrastructure, such as the development of a blog in the Panhellenic School Network. At the same time, data was collected through questionnaires and interviews from students and teachers to identify their needs and preferences regarding digital and traditional services. In this phase, collaborations were also initiated with organizations for participation in educational and cultural programs, such as short film competitions, interactive workshops and reading activities .

In the second phase, the action focused on strengthening the library's connection with national and international networks, on the production of original audiovisual and digital material, such as short films, audiobooks and podcasts , and on posting the creations on the blog and on digital platforms. At the same time, the dissemination of the material to other school units, cultural and academic institutions was strengthened, so that the library functions as a dynamic hub of knowledge and innovation. The implementation utilized human resources, such as teachers and students, and material resources, such as computers, cameras, microphones and multimedia processing software, for the creation and dissemination of educational and audiovisual material.

The action schedule covered a full school year. The first two months were dedicated to planning and recording needs. The next four months focused on organizing and recording libraries, classifying material, and creating digital infrastructure. The next two months were dedicated to creating multi-format material and developing digital reading programs . The last four months were used to disseminate the material, evaluate the action, improve processes, and write final reports and presentations for the school community and external stakeholders.

MATERIAL PRODUCED OR UTILIZED

During the action, a multitude of multi-format materials were produced and utilized in order to enhance learning, reading and knowledge dissemination. Email archives were created for communication management, action monitoring diaries and a digital book catalog with detailed information, brief summary and availability information. At the same time, original articles by students and teachers, videos and short films promoting reading themes , podcasts with educational and cultural content, as well as audio books accompanied by audiovisual material were developed.

The produced material was posted on a blog and digital platforms, while dissemination was done through connections to networks such as myLib.gr and the National Library, allowing access to schools and institutions across the country. At the same time, existing digital resources, educational applications and multimedia management software were utilized to enhance the participation of students and teachers in the creation, revision and publication of the material. The synthesis of traditional and digital material contributed to the creation of a fully functional and multidimensional learning environment, which incorporates modern technologies and pedagogical practices (Ross et al ., 2018; Oliveira et al., 2022).

EVALUATION OF THE ACTION

The evaluation of the action was carried out using a combination of quantitative and qualitative methods, in order to accurately capture the effectiveness of the action plan and its impact on the school community. The quantitative criteria included recording the participation of students and teachers in library activities, the traffic of digital resources and the use of lending services, both physical and digital books. These measurements were carried out through electronic recording systems and monitoring diaries.

The qualitative criteria were based on the evaluation of the quality of collaboration, user satisfaction, creativity and interaction developed between students, teachers and external partners. Data were collected from interviews, questionnaires, action diaries and analytical observations, providing valuable information on the educational needs and preferences of the school community (Kuhlthau, Maniotes, & Caspari, 2007; Ross et al ., 2006).

The evaluation revealed that the library activities promoted the active participation of students and the development of digital literacy skills , while the production of multi-modal material significantly improved the quality of learning and reading . The dissemination of content in school library networks and the connection with external bodies strengthened collaboration and the exchange of good practices, contributing to the national and international dissemination of knowledge (UNESCO, 2022b; Amin & Rahman , 2023).

The use of a blog and digital archives became particularly important, as it allowed for continuous monitoring of activities and assessment of student participation in real time. Feedback from students and teachers demonstrated that the library now functions not only as a place of access to information, but also as a hub of creativity, social interaction and innovation. Systematic recording and production of multi-format materials were crucial factors for the sustainable development of the school library, confirming the importance of the digital transition strategy (Krashen , 2004; Partnership for 21st Century Learning , 2019).

CONCLUSIONS

The implementation of a comprehensive action plan for the digital and functional upgrade of the school library has revealed multidimensional benefits for both students and teaching staff. The transformation of traditional libraries into spaces that combine physical and digital learning environments is now a necessary condition for 21st century education (Hasibuan and al ., 2023). The action demonstrated that the combined use of digital tools and traditional resources enhances digital literacy , critical thinking and student autonomy, while promoting creativity and social interaction (McDougal and et al ., 2023; Cremin & Coles , 2023).

The production of multi-format materials, such as short films, podcasts , audiobooks and interactive educational tools, contributed to the active participation of students, allowing them to develop collaboration and teamwork skills. At the same time, the dissemination of the materials in national and international library networks promoted the exchange of knowledge and best practices, strengthening the culture of lifelong learning (Ross and al ., 2018; UNESCO, 2022a).

The evaluation revealed that the library now functions as a “third space” of learning, where students can develop skills beyond the conventional classroom context and engage in creative and psychosocially empowering activities. The digital transition is supported by staff training and strategic planning, allowing for continuous adaptation to the needs of students and the school community (Vrana , 2017; Oliveira Ramos et al ., 2022).

This experience demonstrates that digital upgrading is not only about technological modernization, but also incorporates pedagogical innovation, a social dimension and strategic planning, making the library a center of learning, creation and innovation. Overall, the action demonstrated that the sustainable integration of digital tools and the utilization of multi-modal material enhance both the educational role of the library and the psychosocial development of students, creating a model of a modern school library (Konlan et al ., 2025; Lankes , 2011).

This experience highlights the importance of collaborating with external bodies and networks of good practices, which enhance the social dimension of learning and offer opportunities for innovation, creativity and continuous feedback. Furthermore, the holistic approach of the school library, which combines physical presence, digital tools and pedagogical guidance, is a model for other school units and promotes 21st century education in a sustainable and effective way.

In conclusion, the action demonstrated that the school library can function as a center of learning, creation, social interaction and innovation, enhancing students' skills, participation and autonomy, while promoting reading , digital literacy and lifelong learning.

PROPOSAL FOR IMPROVING DIGITAL SERVICES IN SCHOOL LIBRARIES

The development and strengthening of digital infrastructure is a crucial factor in promoting learning, reading and digital literacy . The proposal is based on seven axes of action, which cover technological and pedagogical needs, so that the library functions as a modern hub of learning and creation.

The first axis concerns the strengthening of digital infrastructures and systems, by upgrading digital platforms , integrating information management tools and ensuring digital security, while the connection to national and international databases broadens the range of educational resources (Lankes , 2011; Borgman , 2015).

The second axis focuses on the systematic training of staff and students in digital skills, information search and multimedia content creation, in order to enhance active participation and knowledge production (Ala-Mutka , 2011; OECD, 2019).

The third axis concerns the development of creative and educational materials, such as podcasts , videos, e-books and educational games, promoting active learning and collaborative digital projects (Neuman & Celano , 2012; Johnson et al ., 2016).

The fourth axis includes strengthening collaborations with cultural, academic and social actors to exchange knowledge and good practices, contributing to social innovation and the development of transdisciplinary skills (UNESCO, 2022a).

The fifth axis concerns the creation of evaluation and feedback systems, in order to ensure the continuous improvement of digital services and their adaptation to the needs of the school community (Krashen , 2004; Partnership for 21st Century Learning , 2019).

The sixth axis includes the integration of innovative technologies, such as interactive whiteboards, virtual reality and digital learning platforms, to enhance the learning experience and creativity of students (Johnson et al ., 2016).

The seventh axis concerns the promotion of the sustainability of digital practices through continuous staff training, strategic planning and collaborations with networks of good practices, ensuring the long-term impact of actions on education and society (Hasibuan and al ., 2023; Konlan and al ., 2025).

Overall, the proposal aims to create a school library that functions as a dynamic, multidimensional learning hub, integrating technological and pedagogical innovation, while promoting collaboration, creativity and lifelong learning.

email: jndimit@gmail.com

ABSTRACT

This scientific article explores the contribution of infographics to the learning process by examining their design principles, pedagogical applications, and effects on students' cognitive development. Infographics combine visual and linguistic elements, offering an efficient way to organize and present complex information. In recent years, their use has significantly increased as they have proven to be particularly effective in facilitating the understanding and assimilation of both fundamental and complex concepts through structured visual data representation. According to literature, cognitive learning theory integrating multiple information channels enhances memory recall and promotes a deeper understanding of concepts.

Following a primary methodological approach of literature review, the article analyzes their usage in education as well as the challenges arising from their use. Through systematic analysis of research data and theoretical perspectives, the article highlights their contribution to the learning process. Alongside, it notes potential difficulties that emerge from their use, underscoring that an overly large amount of information without necessary guidance may cause cognitive overload, adversely affecting information processing and assimilation.

Particular emphasis in the publication is placed on the use of infographics across interdisciplinary fields (natural sciences, language education, social sciences, etc.) and their significance as a tool for development, creation, and application through the use of specialized methodological tools such as Napkin and Venngage platforms. The case studies developed provide specific and measurable data on how visual graphics can support teaching, enhance understanding of concepts, and improve the learning experience.

The immediate goal of the research is to highlight the educational significance of infographics in both informal and formal educational environments. Their ability to transform complex information into comprehensible visual formats enhances cognitive engagement, inclusive learning, and reflective thinking through visual and digital literacy. Students' participation in their creation strengthens skills such as data analysis, communication, and collaboration.

The paper is directed towards the entire educational community and also challenges educators to develop imagination and creativity, aiming for a modern, structured, and technologically informed practice

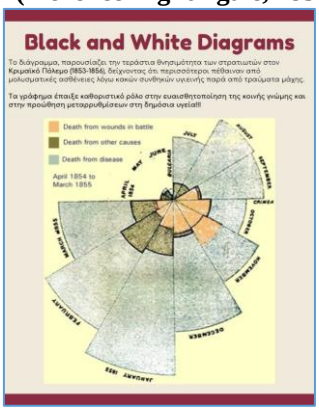
Keywords: Infographics, Digital and Visual Literacy, Charts, Learning

INTRODUCTION

As modern education evolves in the digital era, it must adapt to meet new learning demands. The continually increasing flow of information has made knowledge transmission more challenging. In today's environment dominated by visual stimuli, infographics have emerged as a valuable tool that enhances understanding and memory, making learning more accessible to students.

This study examines the relationship between the use of infographics and learning outcomes, focusing on the characteristics that make them effective in the teaching process. Their importance is indisputable, as students live in a visually rich environment (Mayer, 2009, pp. 1-19). Utilizing them enhances information retention, understanding, and active student engagement. Research indicates that students who use them achieve higher performance compared to those taught with traditional methods (Eisenberg, 2008, pp. 9-17, 19-37, 48). Therefore, integrating them into teaching practice significantly contributes to improving learning outcomes and developing digital skills.

Katsarounis (2020) argues that infographics enhance interactivity and facilitate understanding by providing simplified visual representations of information. Students who use them demonstrate greater retention and comprehension abilities.



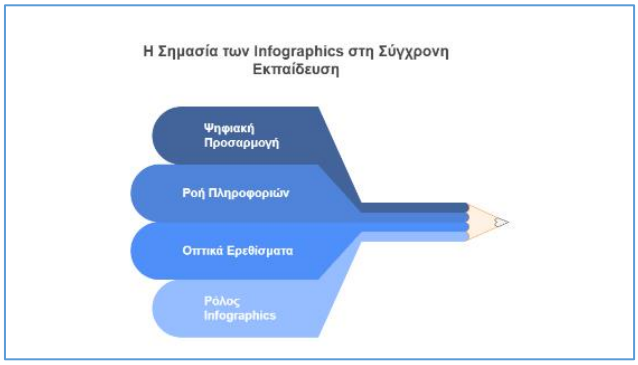
This paper focuses on three key questions. The first concerns what design elements affect the effectiveness of infographics. The second explores the benefits of their use in teaching, and the third analyzes what challenges may arise during their implementation in the learning process.

The paper is divided into four sections. The first describes the theoretical background of infographics. The second presents the basic design principles. The third focuses on their application in teaching, and the fourth analyzes the benefits of using infographics in the educational process.

THEORETICAL BACKGROUND ON THE USE OF INFOGRAPHICS IN EDUCATION

Infographics, or informational graphics, are visual tools that combine information and graphics to convey data, ideas, or processes in a clear and appealing manner. According to the C.E.E.C. (2013), they are "visual representations of information, allowing complex ideas to be represented simply" (C.E.E.C., 2013). They include graphs, maps, diagrams, and icons and are used in education, advertising, and journalism.

Figure 1
Black and White Charts" (Florence Nightingale, 1858–Public Domain Image)



Their history dates back to the 19th century, when statistical analysts like Florence Nightingale (Figure 1) used diagrams for data representation. In the modern era, technological advancements and platforms like Canva and Piktochart facilitate their creation (Griffin, 2020). New trends in their design and use in education are emerging in the literature (Venngage, 2024), while challenges in their application in the educational field are also being examined (IEEE, 2023).

Infographics are a valuable tool because they facilitate the understanding of complex information and enhance student engagement (Damyanov & Tsankov, 2018, pp. 82-92). Thus, information becomes more accessible and interesting, fostering greater student participation.

Learning outcomes reflect the knowledge and skills that students acquire, capturing the abilities they should demonstrate at the end of an instructional period (Bloom, 1956). The use of infographics improves information retention and enhances understanding of topics (Ainsworth, 2006). Students who use them comprehend information more quickly and achieve better test performances (Dunleavy & Dede, 2014).

The psychology of learning highlights the importance of visual tools (Figure 2), such as infographics. According to the Dual Coding Theory (Paivio, 1986), comprehension is enhanced when information is presented both verbally and visually.

Figure 2
Cognitive Principles and Psychology of Learning (Created using Napkin AI)

Simultaneously, Constructivist Learning (Piaget, 1976) emphasizes active student involvement. Infographics promote interaction with data, enhancing learning through visual stimuli (Schnotz & Kürschner, 2007). As an educational tool, they facilitate the understanding and connection of theory with practice.

BASIC DESIGN PRINCIPLES OF INFOGRAPHICS

a. Design and Presentation

Colors: The design and presentation of infographics affect the communication of information. A fundamental principle is the correct choice of colors, as they shape visual perception. Using a limited color palette maintains consistency and enhances clarity (Ware, 2012). Overly bright combinations that distract the viewer should be avoided. A practical rule is to use three primary colors with varying shades (Figure 3): the main color for titles, a secondary color for subtitles, and an accent color for highlighting important data.

Figure 3
Color Selection Strategy for Infographics (Created using Napkin AI)

Fonts: The choice of fonts affects readability. Titles require bold fonts, while the main text should be simple and clear (Kostelnick & Roberts, 2011).

Layout: The arrangement of elements in an infographic should be logical and structured, guiding the reader from the most to the least important information (Tufte, 2006). White space, or "negative space" (Figure 4), plays a crucial role in improving readability, comprehension, and aesthetics.

Proper use of white space contributes to:

i. Improved Readability
ii. Focus on Information
iii. Creation of Balance
iv. Increased Aesthetic Value
v. Enhanced Comprehension

The strategic placement of white space helps readers more easily perceive relationships between elements, especially in infographics with complex concepts or data.

Figure 4:
The Importance of White Space in Infographic Design (Created with Napkin AI)

Clarity and usability are critical success factors. A well-designed infographic (Figure 5) should be immediately understandable without additional explanations (Duarte, 2010).

Figure 5
Basic Design Principles (Created using Napkin AI)

The customization of infographics is essential for their effectiveness. Educators need to be aware of their audience and learning objectives before creating them. This includes understanding the recipients' preferences, knowledge level, and interests (Berk, 2016, pp. 44(3), 301-314).

The presentation format also plays a significant role. Digital infographics can include interactive elements, while print ones need to be attractive without them (Griffin, 2020, pp. 4(2), 95-111).

b. Analysis of Examples

The analysis of infographics in educational settings reveals effective design elements. "The Importance of Reading (Raymond Geddes)" (Figure 6a) uses simple language and an accessible visual presentation to depict statistical

data about reading (Heinrich, 2018, pp. 66(1), 1-19). The evaluation of the infographic shows the correct use of colors to highlight key points, clear fonts, and a natural layout. The visual elements are balanced, facilitating understanding without information overload.

Figure 6a
The Importance of Reading Infographic

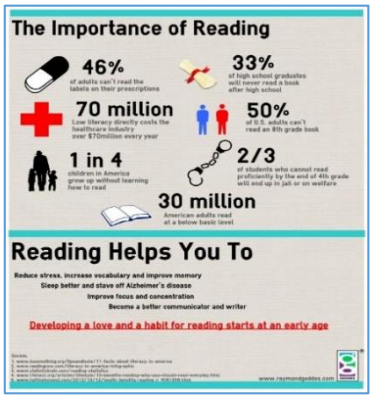


Figure 6b
How to Learn Effectively

Another successful example is "How to Learn Effectively," which includes learning strategies. The linear layout facilitates easy tracking, while the icons and charts enhance understanding and credibility (Bork, 2018, pp. 15(2), 45-56).

APPLICATION OF INFOGRAPHICS IN TEACHING

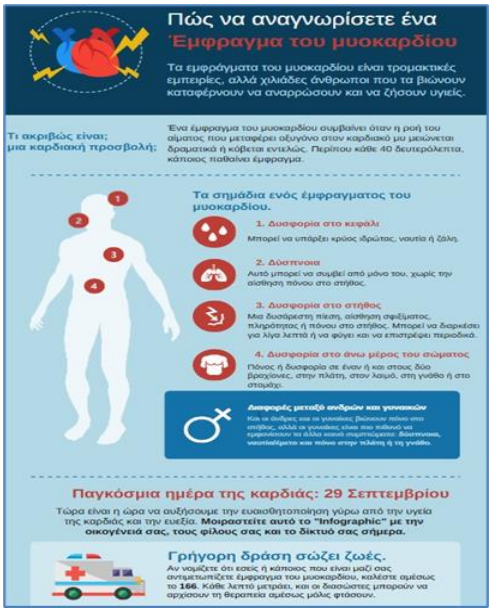
a. Education Strategies

The utilization of infographics in education can be achieved through strategies tailored to the teaching subject. Effective practices include:

- Creating infographics by students, which enhances engagement and understanding.
- Visually depicting complex concepts, facilitating the understanding of relationships and processes.
- Analyzing and synthesizing texts to help compare and visualize key ideas.
- Using them as educational tools by integrating them into lectures to improve attention.

Active student participation in creating infographics is organized into seven (07) stages:

i. Topic selection and objective setting, enhancing autonomy.
ii. Data collection and analysis for better information organization.
iii. Designing and composing using tools like Canva or Piktochart.
iv. Presentation and discussion, encouraging critical thinking.
v. Feedback and improvement based on peer comments.
vi. Using technological tools for collaborative editing.
vii. Evaluation and reflection, developing critical thinking.



Benefits of student participation include:

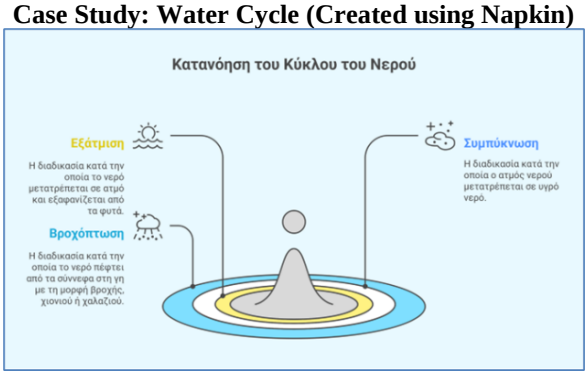
- Autonomy in learning.
- Collaboration through teamwork.
- Critical thinking and data evaluation.
- Creativity in visualizing information.

Based on the above, an activity involving the creation of an infographic on the symptoms of a heart attack (Figure 7) is presented. It follows a step-by-step structure, ensuring it is concise, direct, and easy to read..

Topic: Designing an Infographic – Symptoms of a Heart Attack
i. Students select the topic and define the goal of the infographic.
ii. They collect and analyze relevant data, such as statistics.
iii. They create the infographic using Venngage or similar tools.
iv. They present their work to the class.
v. They receive feedback and make improvements.

Figure 7
Designing an Infographic: Signs of a Heart Attack (Created with Venngage)

b. Tools and Platforms



There is a wide variety of infographic design tools that can be utilized in education to create visual representations. Some of the most popular include:

1. **Canva**: An online tool (https://www.canva.com) with ready-made templates and collaborative features, facilitating the creation of infographics (Griffin, 2020).
2. **Piktochart** A platform (https://piktochart.com) for presenting data through charts and tables, useful for topics involving statistics (Chen, 2018).
3. **Visme**: A tool (https://www.visme.co) that allows for creating interactive infographics with multimedia, enhancing the learning experience (Berk, 2016).
4. **Napkin**: An AI platform (https://www.napkin.ai) that converts text into charts and diagrams, useful for presentations and reports.
5. **Venngage**: An online application (https://venngage.com) that creates infographics through artificial intelligence.
6. For optimal use, educators must guide students on the basic principles of visual communication and design, ensuring the effectiveness of the infographics (Duarte, 2010).

c. Case Studies

Case studies provide tangible examples of how infographics can be used and integrated into teaching to positively influence the learning process for both educators and students.

Figure 8
Case Study: Water Cycle (Created using Napkin)

1. Science Lesson: In this activity, students create an infographic that depicts the phases of the water cycle (Figure 8), such as evaporation, condensation, and precipitation. Through this process, they research, organize, and present the information in an understandable and engaging manner. A comparison of learning outcomes before and after the activity shows a significant improvement in understanding the topic, as students can now clearly explain the related processes (Carlson, 2016).

2. Language Teaching Lesson: The activity aims to guide educators in creating an infographic that will help students understand and summarize key grammar concepts in a visually appealing and comprehensible way (Figure 9). By using this tool, educators can simplify complex concepts, organize information more effectively, and enhance student engagement.

Figure 9
Case Study: Basic Verb Tenses (Created using Napkin)

This particular example demonstrates how an infographic can aid students in language learning in the following ways:

i. Visual Representation of Tenses
ii. Concise Presentation
iii. Memory Enhancement
iv. Multiple Information Sources:
v. Practical Application

3. Chemistry Lesson: The following example can support student learning in Chemistry (Figure 10) by focusing on five key areas. The visual representation, concise presentation, multiple sources of information, memory enhancement, and understanding of relationships significantly contribute to facilitating learning and improving the comprehension of atomic structures.

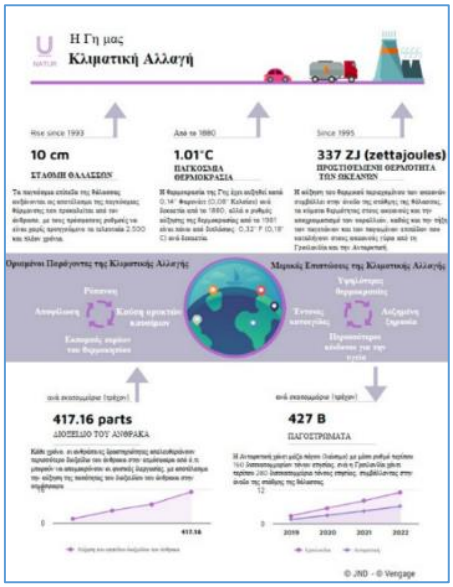


Figure 10
Case Study: Structure and Composition of the Atom (Created using Napkin)

4. Environmental Studies - Climate Change

Using an infographic for climate change (Figure 11) offers significant benefits in understanding, raising awareness, and educating students.

Figure 11.
Environmental Studies: Climate Change (Created using Venngage)

In all the presented examples, educators assess the impact of infographics on student learning and engagement. Students are actively involved, gaining a clear understanding and experiencing learning as a creative process (Dunleavy & Dede, 2014).

BENEFITS AND CHALLENGES

a. Benefits of Using Infographics

The utilization of infographics in education enhances teaching and learning.

- **Enhancement of Understanding and Memory**: Infographics convert information into visual elements, facilitating perception and memorization. Research shows that students exposed to visual representations understand and retain knowledge better (Mayer, 2009). Additionally, the combined use of images and text allows for more effective assimilation of information (Panagiotou, 2023).
- **Increase in Engagement and Interaction:** They capture students' attention and enhance collaboration (Berk, 2016; Dunleavy & Dede, 2014). Research by Neophytou and Karadima (2021) indicates that they contribute to the development of critical thinking through the analysis of visual data.
- **Development of Critical Thinking**: Creating infographics requires data analysis, enhancing critical thinking. Choosing and depicting significant information improves analytical and creative thinking (Bork, 2018).
- **Integration of Information from Various Sources:** They allow the combination of data from diverse sources, facilitating interdisciplinary learning and the connection of knowledge (Griffin, 2020, pp. 4(2), 95-111).

b. Challenges and Limitations

- **Difficulty in Design**: Educators may struggle with selecting tools and creating high-quality results, as effective visual communication requires specialized knowledge (Kostelnick & Roberts, 2011). Additionally, creating effective infographics demands time and effort.
- **Challenges in Presentation**: Information overload can lead to confusion (Tufte, 2006). It is important to maintain simplicity and focus on key points.
- **Varying Levels of Knowledge**: Students do not have the same familiarity with design tools, creating inequalities in the quality of their work (Heinrich, 2018). Educators need to provide support.
- **Need for Teacher Training**: The lack of training limits the integration of infographics into teaching (Berk, 2016). Panagiotou (2023) emphasizes the importance of training for optimal utilization.
- In conclusion, while infographics enrich teaching, their implementation requires careful planning, training, and support for educators.

CONCLUSIONS AND FUTURE DIRECTIONS

This study focuses on the importance and utility of infographics as an educational tool, along with their role in enhancing the learning process. By analyzing their basic design principles and application in teaching practice, significant conclusions are drawn.

Infographics substantially contribute to the understanding and retention of information, allowing students to organize and assimilate knowledge more effectively, especially in subjects like the natural sciences, mathematics, and languages (Aivazoglou, 2020, pp. 18(2), 55-67; Tufte, 2006). Additionally, when students create infographics themselves, it enhances their active participation and develops their critical thinking, as they creatively present their knowledge (Baltzis, 2017, pp. 12(1), 32-47; Farkas, 2019).

However, challenges such as information overload and varying student skill levels may limit this technique's effectiveness. This necessitates appropriate training and guidance for educators to make the best use of infographics (Katsoula, 2018, pp. 8(2), 45-59; Bresciani, 2021).

Future research can focus on comparing the use of infographics across different educational systems and cultural environments, highlighting best practices and new strategies (Sideris, 2021, pp. 17(1), 102-116; Li, 2018, p.21). Furthermore, developing modern tools that simplify infographic creation could enhance the learning experience. Moreover, integrating interactive elements, such as information or embedded videos, may offer students a more engaging and dynamic experience (Kontopidis, 2022, pp. 19(3), 78-90; Smiciklas, 2012). Finally, continuous teacher training in new digital technologies and tools is crucial for maximizing these means (Vamvakas, 2020, pp. 6(2), 88-101; Mayer, 2014).

To summarize, infographics are a versatile and powerful tool in teaching, facilitating the comprehension of complex concepts and enhancing student interaction and creativity. Visual media aid in managing the abundance of information and can provide an innovative approach to learning (Aivazoglou, 2020, pp. 18(2), 55-67; Tufte, 2006). Therefore, their proper use and ongoing research in this area will strengthen the learning process, contributing to the formation of a modern educational environment.

Based on the publication's findings, further research is suggested on topics such as the effectiveness of infographics in knowledge retention, the development of best design practices, and their integration into broader differentiated teaching techniques (use in distance education, various educational levels, intercultural approach). This work will be beneficial for anyone interested in the design, preparation, and application of graphic information in education. Integrating modern technological tools, such as AI for personalized infographic creation and the use of interactive or animated graphics, can offer new perspectives in teaching and learning.

ABSTRACT

The article has to do with a teaching scenario in Chemistry, aiming to mobilize and reflect on issues of pseudoscience or misleading the public, on scientific issues in a digital world full of information overload, challenges and deceptions. Based on the discovery-investigation and collaborative group method, using modern digital tools, the teaching scenario has its main goal the education of active and concerned students-digital citizens on issues of science and scientific deception. It can serve as a guide to be adapted to other Science subjects such as Biology and Physics, serving corresponding teaching objectives for students in the 3rd year of middle school and high school classes.

Keywords: science, scientific deception, natural sciences, pseudoscience, digital citizen

INTRODUCTION

In a constantly evolving world, where science and technology are rapidly advancing, communication and information increasingly revolve around the internet and its applications, educating young people about digital citizenship is more essential than ever. The use of new technologies serves as a crucial tool for supporting and encouraging students to engage in learning activities that add value to the implementation of more student-centered teaching models (Da Ponte et al., 2002; Polly et al., 2010).

Information and Communication Technologies (ICT) currently affect every aspect of human life. They play prominent roles in workplaces, businesses, education, and entertainment. Moreover, many recognize ICT as a catalyst for change in working conditions, the handling and exchange of information, teaching methods, learning approaches, and scientific research. In this digital era, the integration of ICT in the classroom is vital for providing students the skills necessary for the 21st century (Ratheeswari, 2018).

Today's digital learning tools span a wide range—from e-learning platforms and virtual simulations to online labs, teacher-student communities, educational videos, digital journals, and blogs (Bruntha et al., 2024). In an ever-increasing number of such tools, students must learn to identify useful and valid resources while rejecting those lacking scientific validity or aiming primarily at profit, deception, or misinformation.

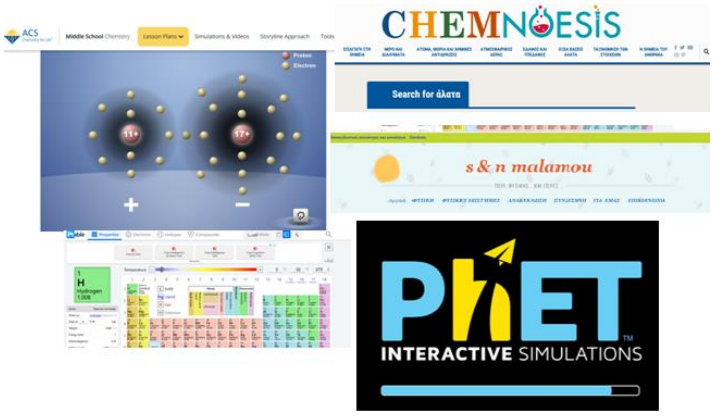
Considering the rise of pseudoscientific content and the spread of false scientific information—often designed to mislead and deceive citizens with real-world consequences—educating students in how to identify reliable scientific news becomes critical. Trust in science is a key element of contemporary education and can foster the development of scientific thinking (Hendriks et al., 2016). In this context, the teaching scenario "Truth or Lie? What Should I Believe?" was developed, combining digital citizenship education (Richardson & Milovidov, 2019) with critical thinking in scientific contexts. Though implemented within the framework of Chemistry, it can be easily adapted to other science subjects, such as Physics or Biology.

DESCRIPTION OF THE TEACHING SCENARIO

The purpose of this teaching scenario is to promote students' active engagement in learning scientific content, to develop their critical thinking regarding the use of digital media on the internet, to familiarize them with reliable educational resources and tools, and to help them identify fake news. Through inquiry and reflection, students should be able to use the internet and digital tools safely and appropriately—initially in the context of science and then across broader subjects—thus protecting themselves from pseudoscientific ideas.

In this teaching scenario, educational software and ICT tools are utilized to help students realize their usefulness in understanding Chemistry, while simultaneously recognizing the importance of digital citizenship. For instance, students are encouraged to navigate and search for information on the Web, manage digital content, and generally develop essential digital skills. The ultimate aim is to raise awareness that being a digital citizen is a modern necessity, as the internet and digital tools are now embedded in everyday life.

The cognitive areas covered by this teaching scenario are targeted toward 9th to 12th grade of Chemistry classes. More specifically, the scenario focuses on ionic compounds, salts, pH, the periodic table, and general Chemistry-related topics. Prior knowledge in these concepts is not necessary; in fact, one of the goals is to introduce or reinforce these topics. Many students struggle with understanding these concepts, and this approach can offer both an introduction and a deeper grasp of the material (Hafeez, 2021). The contribution of ICT tools is particularly significant for students with special educational needs and learning difficulties (Adam & Tatnall, 2017).



METHODOLOGY

This teaching scenario has been designed to be implemented within a teaching hour, during which students are divided into groups of 2-3 individuals, with each group using a computer in the computer lab. Alternatively, the lesson can be conducted in a regular classroom with a single computer and a projector. The digital tools and websites used in this scenario are as follows: American Chemical Society (Worksheets on Ionic Bonding), NOESIS - Department of Chemistry, Aristotle University of Thessaloniki (Digital Learning Objects), University of Colorado (Simulations), Educational Website – Useful Educational Material – Scientific News, Periodic Table (Interactive Digital Tool), Educational Videos (University of Nottingham), Educational Videos (TedEd Educational Non-Profit Community), Science in School (European Science Journal for Educators), Commonsense (Non-Profit Organization for Digital

Citizenship), Canva (Design Digital Tool), Google Docs (Collaborative Documents), Linoit (Digital Tool for Shared Interaction).

The worksheet for implementing this teaching scenario was designed based on the "Prediction - Experimental Control - Explanation" framework. It utilizes the potential of various digital tools and emphasizes research and critical thinking in scientific subjects.

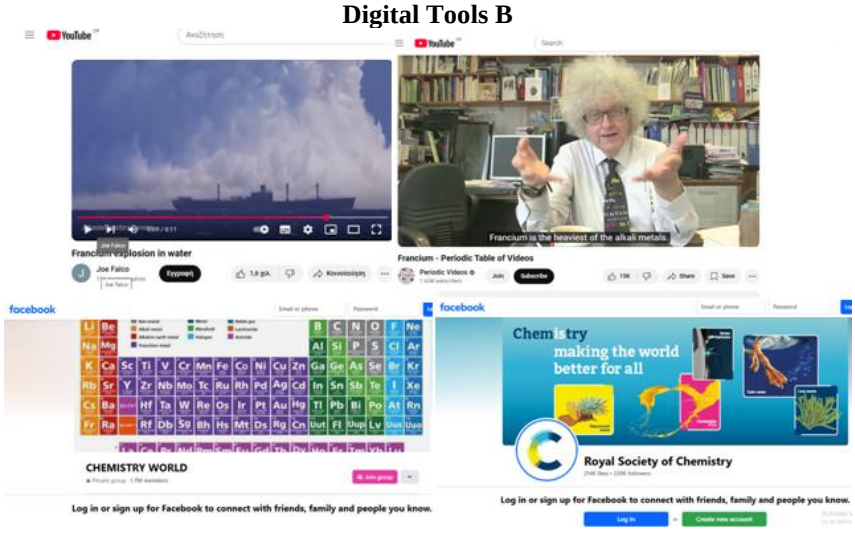


Image 1
Digital Tools A

In the first phase of the worksheet, students are asked to predict the answers to four questions related to chemistry, digital citizenship, and the use of digital tools. They answer based on their existing perceptions and personal experiences. At this stage, no discussion is held on the accuracy of the predictions. Students will verify the correctness of their answers at the end of the lesson, comparing them with their final responses after completing the investigation phase.

In the second phase of the worksheet, the investigation phase, students conduct their research by following a set of instructions and completing a series of seven activities. In the first activity, students are asked to visit a website that demonstrates ionic bonding using various digital tools such as educational videos, interactive visualizations, and digital representations. They are tasked with identifying the types of digital tools used, their creators, evaluating the site's reliability, and determining whether they would trust the website for future use.

Image 2.
Digital Tools B

For activities 2 to 5, students are asked to answer the same questions as in the first activity, but this time for different digital tools: educational content websites, simulations, teachers' blogs, and the digital interactive periodic table. These tools were selected so that students can interact with valid scientific tools that they can evaluate, trust, and use in the future to enhance their scientific knowledge and deepen their understanding of scientific concepts (Image 1).

In activities 5 and 6, students are asked to watch two different videos online about the same chemical element, one of which contains false information and uses science to attract large viewership for profit. They are also tasked with visiting two different groups on a social media platform, one of which is from a reliable scientific organization and the other with questionable motives and content (Image 2).

At this point, students are encouraged to critically compare the two digital tools and reflect on the concept of reliable versus unreliable sources, considering the consequences of using unreliable digital tools. This goal is also addressed in Activity 7, where students first watch a video about fake news from a trusted educational website, then visit a website discussing the supposed health benefits of Himalayan salt. They are asked to search for the creator of the website, examine whether it has a commercial purpose, and understand its overall objective. Following this, they compare the website's content with reliable sources about Himalayan salt, from a scientific article published in a peer-reviewed journal. This enables students to confront reliable and unreliable online sources, distinguishing between scientific and non-scientific opinions on everyday issues, guided by their teacher (Image 3).

Image 3.
Digital Tools C

In the third phase of the worksheet, the evaluation phase, students are asked to revisit the questions from Phase 1 and compare their new answers with their initial responses. Through class discussion, students are guided to the final conclusions, which are shared with the entire group. In this phase, Activities 1, 2, and 6 are specifically designed to introduce students to user-friendly, reliable, and freely accessible digital tools through which they can present their conclusions from the worksheet. If time is limited, some of these activities can be assigned as homework.

The worksheet, presented in the Appendix, has been designed to meet the initial objectives of this lesson. The selection of websites and digital tools was primarily based on criteria such as reliability, scientific validity, and recognition by the international educational community. Another key factor was the free availability of these tools, ensuring equal access to knowledge for all students. Additionally, the reliability of the tools, their continuous updates, ease of access, and connection to the educational content and curriculum further influenced the selection from a wide array of digital tools. The hyperlinks for the websites and digital tools used (last accessed 24/06/2025) are as follows:

CONCLUSION

After the implementation of this teaching scenario, students will be able to: recognize valid digital tools, enabling them to use them in future research and applications; realize the value of reliable digital tools and their contribution to knowledge acquisition; observe and identify the elements that make a website trustworthy or unreliable, and consequently avoid or reject unreliable sources, including fake news; recognize digital tools that offer free, scientifically credible applications and avoid those that may require payment or lack scientific design; and finally, understand the importance of digital citizenship and its strong connection to various educational subjects, particularly in the natural sciences, where fake news can endanger public health and safety.

APPENDIX

STUDENT WORKSHEET: "CHEMISTRY AND THE DIGITAL CITIZEN"
A. PREDICTION – STUDENT INTEREST ACTIVATION

Activity 1. Do you believe that using digital tools helps you understand scientific phenomena in chemistry, stimulates your interest, and makes the lesson more enjoyable? Yes or No

Activity 2. Are there cases where you can't decide which digital tools or websites to use online or you don't know which ones are scientifically reliable? Yes or No

Activity 3. Do you believe that there is false information about scientific issues aiming to mislead readers and influence their decisions negatively? Yes or No

Activity 4. What can someone do to avoid the "pitfalls" of the internet? Provide 2–3 useful tips.

B. INVESTIGATION

Activity 1. Visit the link about sodium chloride and the ionic bond, then answer the following:
- Which digital tools appear on the website? (e.g., video, simulation, quiz, educational community, virtual lab, digital visualization, office tools like ppt)
- Who are the site creators? Do you consider it a trustworthy source? Why or why not?
- Do you trust the information to use the site in future searches? Why or why not?
Activity 2. Visit the link about salts and answer the same questions as in Activity 1.

- Which digital tools appear on the website? (e.g., video, simulation, quiz, educational community, virtual lab, digital visualization, office tools like ppt)
- Who are the site creators? Do you consider it a trustworthy source? Why or why not?
- Do you trust the information to use the site in future searches? Why or why not?
Activity 3. Visit the link about pH and answer the same questions as in Activity 1.

- Which digital tools appear on the website? (e.g., video, simulation, quiz, educational community, virtual lab, digital visualization, office tools like ppt)
- Who are the site creators? Do you consider it a trustworthy source? Why or why not?
- Do you trust the information to use the site in future searches? Why or why not?
Activity 4. Visit the educational blog link and answer the same questions as in Activity 1.

- Which digital tools appear on the website? (e.g., video, simulation, quiz, educational community, virtual lab, digital visualization, office tools like ppt)
- Who are the site creators? Do you consider it a trustworthy source? Why or why not?
- Do you trust the information to use the site in future searches? Why or why not?
Activity 5. Visit the interactive periodic table link and answer the same questions as in Activity 1.
(Figure 2. Interactive Periodic Table as a reliable educational digital resource.)

Watch the two videos: "Francium – video 1" and "Francium – official", and think about how not everything you see online is necessarily true.

Activity 6. Visit the two Facebook group links (facebook1 and facebook2) and compare them:
- Identify: the creator, presence of ads, author, target audience, purpose, sponsorship.
- Which group do you trust and which do you reject? Why?

Activity 7. After watching the videos about fake news, visit both the Himalayan salt website and the Science in School website:
- Identify: the creator, presence of ads, author, audience, purpose, sponsorship.
- Which source do you trust and which do you reject? Why?
C. CONCLUSIONS / EVALUATION

Activity 1. Visit the Commonsense website and create a list of scientifically valid digital tools for chemistry suggested by the organization. Use Google Docs to collaboratively describe what type of digital tool each is (e.g., video, simulation).

Activity 2. Revisit the Science in School website and identify strategies to avoid falling for fake news. Use Canva to design a poster showing guidelines for recognizing fake news (can be homework if time is limited).

Activity 3. Do you believe that using digital tools helps you understand scientific phenomena in chemistry and makes the lesson more enjoyable? Yes, as long as... / No, because...

Activity 4. Are there cases where you can't decide which digital tools or websites to use online or you don't know which ones are reliable? Yes, because... / No, because...

Activity 5. Do you think there is false scientific information aiming to mislead readers? Yes, because... / No, because...

Compare your answers in Activities 3, 4, and 5 with those from Section A.

Activity 6. Do you believe that digital citizenship is related to chemistry? Briefly explain your thoughts using the Linoit application

ABSTRACT

The integration of refugee children into the Greek educational system requires flexible and innovative approaches that incorporate digital tools and interactive learning methods. While attending face-to-face lessons remains our primary goal, students' frequent absences due to social and family factors create learning gaps. To address these challenges and leverage the digital tools provided by the Panhellenic School Network, a digital Hive was created on the e-me platform, based on Connectivism and Gamification theories as means to enhance inclusive education.

In the e-me Hive, refugee students can access educational material continuously, participate in interactive activities, communicate with their teachers, and collaborate with their classmates. At the same time, the platform facilitates parental involvement in the learning process, creating a digital educational ecosystem that transcends the boundaries of the physical classroom. Gamification is utilized through interactive quizzes, games, and challenges, which increase student engagement and motivation. These activities, tailored to the linguistic needs of refugee children, enable them to learn Greek in an enjoyable manner. Additionally, continuous feedback and self-assessment opportunities within the platform enhance students' active participation and autonomy.

Through interactive vocabulary and grammar exercises tailored to students' language proficiency levels, audiovisual materials, available digital dictionaries in languages such as Farsi and Arabic, and gamification-based activities such as quizzes and games, the platform serves as a communication tool that facilitates interaction between students, educators, and parents. Furthermore, it may also function as a language learning tool for the parents of refugee students.

The initial results indicate increased student engagement, as the digital and gamified environment makes learning more attractive. There is also an improvement in linguistic development, thanks to the multimodal approach and access to personalized learning materials. Additionally, the platform enhances students' exposure to the Greek language, even outside of school settings.

This presentation showcases how the e-me platform, through the creation of specialized Hives, functions as a dynamic tool for digital and inclusive education. The integration of Connectivism and Gamification creates an engaging, interactive, and participatory learning environment, enhancing the linguistic and social inclusion of refugee children, making learning more flexible, accessible, and interactive.

Keywords: Inclusive education, Greek language learning, refugees, Reception Classes (ZEP), digital tools, e-me, Connectivism, Gamification

INTRODUCTION

The inclusion of refugee children in the national educational systems of host countries represents a critical challenge and a moral imperative for modern democratic societies. In Greece, Reception Classes (ZEP) have been established as a key institutional response to this need, aiming to support the integration of refugee and migrant children into the school community. However, the social and familial conditions of these students — often characterized by instability, frequent relocations, and limited access to linguistic and cultural resources — create significant barriers to learning and participation.

Traditional teaching methods, which rely primarily on face-to-face instruction and a fixed curriculum, often prove insufficient in addressing the dynamic needs of refugee learners. Especially in remote areas or in schools that host children from refugee accommodation structures, student absenteeism is a recurring issue, mainly due to bureaucratic procedures, medical obligations, and a lack of supportive infrastructure. These conditions undermine both the continuity of learning and the acquisition of basic Greek language skills, which are fundamental for social inclusion and educational success.

In response to these challenges, digital educational tools offer new possibilities for inclusive and flexible learning environments. The "e-me" platform, developed by the Greek Ministry of Education through the Panhellenic School Network, provides a virtual space for collaboration, communication, and personalized learning. This article presents a case study of a specialized "Hive" (Kypseli) created on the e-me platform, designed specifically for the linguistic support of refugee students attending a Reception Class in a rural primary school.

The intervention draws on the learning theory of Connectivism, which emphasizes the importance of networks and digital interaction in knowledge construction, and the pedagogical approach of Gamification, which enhances motivation and engagement through game-like elements. The objective of this study is to explore how such a digital environment can function not only as a supplementary educational tool, but as a dynamic ecosystem that fosters linguistic development, active participation, and inclusion for refugee students.

The inclusion of children with refugee biographies in the educational system is not merely a pedagogical challenge, but fundamentally an ethical and political imperative for democratic education systems. As UNESCO (2009) emphasizes, inclusive education is "a process of addressing and responding to the diversity of needs of all learners through increasing participation in learning, cultures and communities, and reducing exclusion within and from education."

In the Greek context, Reception Classes (ZEP) often operate under conditions of structural deficiencies—such as the absence of interpreters, instability in student attendance due to frequent relocations, and a lack of tailored teaching material for students' linguistic and cultural needs. Teachers, frequently without institutional support, are called upon to develop flexible and inventive pedagogical practices to meet the needs of an exceptionally vulnerable student population.

Within this framework, digital learning platforms can act as vehicles of participation, safety, and continuity in the learning experience—provided they are designed not only for access but for active engagement and meaningful connection with the learning environment (European Agency for Special Needs and Inclusive Education, 2022, p. 11). The e-me platform, developed by the Greek Ministry of Education and hosted on the National School Network, offers a safe and exclusively educational digital space. Unlike commercial apps, e-me ensures that students operate within their school's digital community, maintaining their educational identity and interpersonal connections.

The structure of e-me—with personal workspaces, interactive "Hives," and feedback tools—mirrors key features of the physical classroom: routine, predictability, and a sense of community. Thus, it contributes significantly to both educational restoration and the psychosocial stability of refugee students

THEORETICAL FRAMEWORK

This approach is grounded in the theory of Connectivism, as articulated by George Siemens (2005). Siemens argues that traditional learning theories—behaviorism, cognitivism, and constructivism—fail to fully capture the nature of learning in a digitally networked world. Learning, in the connectivist view, is primarily the process of creating and navigating networks. As Siemens states: "Learning is the act of forming and navigating a network of connections" (Siemens, 2005).

In this model, nodes may represent thoughts, emotions, digital tools, or pieces of information, while connections are the cognitive and social relationships that form among them. The strength and quality of these connections determine

the efficiency of information flow, the transition from knowledge to meaning, and ultimately, active learning. The e-me platform supports this process by offering a flexible yet structured environment in which students can self-regulate their learning, access information, construct knowledge, and engage with others.

As Siemens points out: “Knowledge is of two kinds. We know a subject ourselves, or we know where we can find information on it.” In today’s digital learning landscape, the ability to master both the “know-how” and the “know-where” is vital—and e-me nurtures this dual competence by situating knowledge within a safe, familiar, and guided space.

Connectivism is further complemented by the pedagogy of gamification, which enriches instructional design with elements drawn from digital games: missions, challenges, rewards, engaging aesthetics, and interactivity. According to Kapp (2012), gamification significantly enhances student motivation and engagement, making learning more accessible and attractive, particularly for learners struggling with traditional instruction.

For refugee children, gamification reduces anxiety, fosters a positive emotional connection with language, and facilitates the gradual development of vocabulary and self-confidence. As Gee (2003) observes, learning through games involves “situated meaning-making through action and context”—a vital dimension for students unfamiliar with the school language.

In summary, the combination of connectivism and gamification transforms digital platforms from passive information spaces into ecosystems of active learning, where children with refugee backgrounds can build language skills, join communities of learning, and experience school as a space of participation and meaning

DESCRIPTION OF THE INTERVENTION

The educational intervention was designed and implemented in the Reception Class (ZEP) of the Primary School of Nea Kerasounta, aiming to support the linguistic and social inclusion of refugee students through a digital environment tailored to their needs. The central tool of this intervention was a structured Hive (Kypseli) within the e-me platform, which served both as a repository and a dynamic learning space.

Image 1.
e-me Hive of the Reception Class

The e-me Hive created a safe and exclusive digital environment where students could access learning materials asynchronously and maintain a sense of belonging to the classroom—even during periods of absence. This continuity proved particularly significant, given the irregular attendance of many students due to family obligations and bureaucratic appointments. The digital space thus helped ensure that the school remained a familiar and stable point of reference in the students' daily lives.

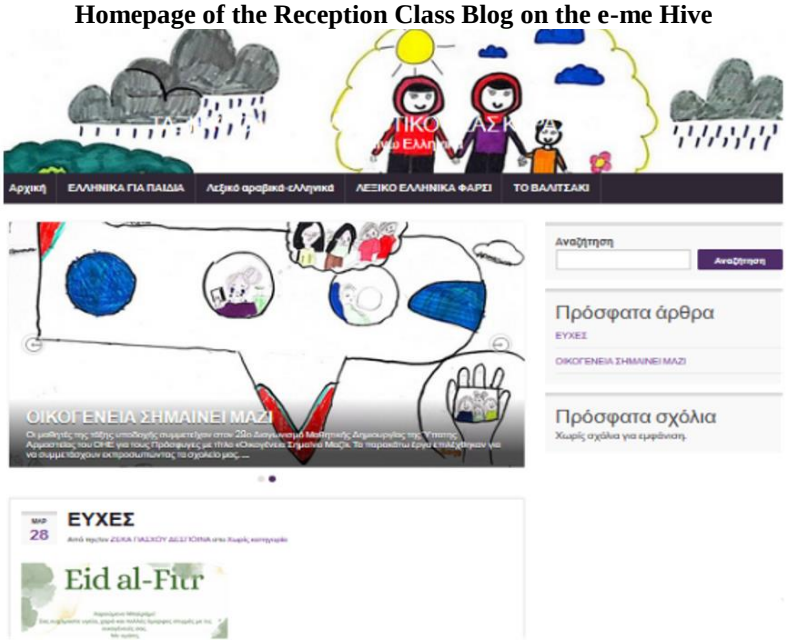
A dedicated blog was developed within the Hive and regul arly updated with structured vocabulary posts and reflections on classroom life. Importantly, it also served as a bilingual archive of student participation, including greeting cards for Bayram, student drawings, and contributions to initiatives like the 2024 student competition “Family Means

Together", organized by the United Nations High Commissioner for Refugees (UNHCR). These posts highlighted not only the students' emerging language skills but also their emotional

Image 2
Flashcard activity

A key feature of the intervention was the use of interactive flashcards, which were posted directly on the Hive's main wall. Organized thematically (vegetables, fruits, clothes, furniture, school supplies), each flashcard displayed a clear image along with the Greek word and an audio pronunciation. This approach was inclusive of all literacy levels, allowing students to engage visually and aurally with the target vocabulary. The cards were scrollable and accessible both at school and from home, supporting repetition, autonomy, and multimodal learning.

In addition to the flashcards, the class engaged with digital learning games created using the Wordwall platform. These included matching tasks, memory challenges, and word–image associations, all designed to consolidate basic vocabulary in a fun and motivating way. Wordwall was selected intentionally due to its user-friendly interface, cost-free tools, and compatibility with low-tech settings. The activities were crafted using the means already available to the teaching team, demonstrating that meaningful digital engagement does not depend on advanced infrastructure but on pedagogical intention and creativity.



EDUCATIONAL IMPACT AND OBSERVED BENEFITS

Through this digital Hive, students experienced a continuity of learning, a recognition of their multilingual identity, and equitable access to tailored resources. The intervention demonstrated how digital inclusion, even in contexts with limited resources, can foster a dynamic, child-centered learning environment grounded in interaction, visibility, and care.

The implementation of the digital Hive led to tangible benefits both within and beyond the physical classroom. One of the most significant outcomes was the increased engagement and active participation of students during in-person lessons. The playful structure of the activities and the accessible digital environment acted as motivational triggers, offering students a sense of continuity and progress regardless of their attendance consistency. At the same time, the intervention succeeded in encouraging families to become indirectly involved in the learning process, despite having minimal—if any—knowledge of the Greek language. Through the shared use of digital tools at home, parents became witnesses to their children's progress and gradually began to identify the school as a meaningful space of inclusion and support.

This intervention aimed, above all, to offer students a sense of belonging. Refugee children arrive at school often deprived of fundamental goods that their peers take for granted. They carry with them heavy emotional burdens—trauma, separation, anxiety, and profound disappointment. What we observed during our work with them is that one of the most heartbreaking causes of school disengagement is not external but internal: the absence of motivation. For many of these children, Greece is merely another stop in a long and uncertain journey. Places and people change constantly, and nothing in their lives seems stable or lasting. Often, they experience a painful sense of invisibility.

Image 3
Homepage of the Reception Class Blog on the e-me Hive

Despite the positive outcomes of the intervention, certain structural limitations remain evident. One of the main challenges lies in the absence of student books in digital form for Reception Classes (ZEP), which significantly hinders remote learning and limits the possibility of autonomous study outside the classroom. Moreover, there is a general lack of pedagogically sound and developmentally appropriate materials designed specifically for learners with zero proficiency in the Greek language. This gap places a considerable burden on teachers, who must often create or adapt materials on their own to meet the needs of their students.

FUTURE PERSPECTIVES AND CHALLENGES

Looking ahead, the success of this intervention points to the potential for broader implementation. A network of interconnected Hives across ZEP classes nationwide could foster the exchange of best practices, shared resources, and collaborative innovation. Such a decentralized but coordinated digital infrastructure would not only support individual teachers, but also contribute to the emergence of a more inclusive, responsive, and culturally sensitive educational framework for refugee and migrant students.

The experience from the Nea Kerasounta Reception Class highlights how even modest digital initiatives, when rooted in care and pedagogical intention, can help overcome barriers of invisibility, instability, and marginalization. Expanding such efforts through institutional support and resource development would be a meaningful step toward educational equity and social inclusion.

The goal of our digital initiative was thus a quiet yet firm declaration on behalf of the school: “I know you may leave—but while you are here, this is your school, these are your teachers and classmates. This space was created for you. It will remain here for you, even in your absence.” The Hive became more than just a digital repository; it functioned as a symbolic act of recognition and care, affirming to each student their place within the educational community, no matter how temporary their circumstances might be.

TEACHING GREEK IN THE INTERCULTURAL CLASSROOM USING THE DIGITAL LANGUAGE LEARNING TOOL "AKELIUS LANGUAGES"

Stavroula Kalaitzidou
Primary school teacher
32nd Athens primary school
Athens, Greece
e-mail: sk8720@windowslive.com

ABSTRACT

The non-profit organization Akelius was founded in 2007 by Roger Akelius, a Swede businessman interested in mathematics, programming and engineering. Apart from charity, helping children in need and providing refuges with medical treatment, the foundation also deals with educational issues through the digital platform "Akelius languages", which was launched in 2018. The platform is being developed by sixty programmers in Berlin, Germany and Nicosia, Cyprus, with the cooperation of UNICEF foundation. "Akelius Languages" is an app that provides an effective method to learn foreign languages, focusing in oral and reading comprehension. With this digital tool, students between 6-18 years old are given the opportunity to learn the Greek language in a faster and more playful way, while they also gain confidence and adapt more easily to the school environment. So far, the platform is available in English, French, German, Greek, Italian, Portugese, Russian, Spanish and Swedish, while it is being used in twelve countries, Albania, Greece, Italy, Poland, Mexico, Bhutan, Bosnia and Herzegovina, Lebanon, Kazakhstan, Mauritania, Cape Verde and Sao Tome/ Principe. It contains language exercises and quiz, songs, crosswords and bingo games, grammar theory, while, as it is still in the process of developing, it is gradually being enriched with mathematics, art and history activities.

According to UNICEF data, it is already used by more than 10,500 refugee children in Greece. To date, approximately 1,600 teachers in public schools and non-formal education centers have been trained in the use of the platform. In particular, in Greek public schools it has been integrated into reception classes (ZEP) but also into general classes, in primary and secondary education, when the student population consists mainly of students with an immigrant and refugee background. The way in which the platform activities will be combined with teaching is the responsibility of the teacher, as there are no ready-made lesson plans. Lesson design is left to the flexibility and creativity of the teacher. Students enter the platform using their personal tablets and headphones, and engage in the activity assigned to them, depending on the content of the day's lesson. The hardware equipment is provided by the Akelius program and is kept in each classroom, as well as provision for internet connection and printed teaching materials. The use of the Akelius application is free, there is no subscription or advertising messages. The platform works both offline and online, but an internet connection is preferable, as students can create their own personal account and monitor their progress.

The benefits of using such a platform are multiple, as the lesson becomes interactive and personalized, as students progress at their own pace, while the teacher can give more selective attention to specific students. Regarding learning outcomes, research conducted by UNICEF in Akelius classes compared to classes with the same student population, but without the use of the platform, demonstrates that there was an 8% improvement in listening comprehension, 9% in reading ability, 25% in oral expression and 34% in written language. Qualitative research has shown that by using the platform, students gained self-confidence, motivation for learning, collaboration and consistency in their presence at school. At the same time, there are benefits for teachers as well, in an era where the use of digital media and new technologies in teaching is now required. This type of blended teaching develops teachers' digital skills, contributing to a more organized and structured lesson. I have personally joined the program and am using the Akelius platform in teaching my class during the school years 2023-2024 (1st grade of elementary school) and 2024-2025 (2nd grade) with students who are entirely foreign speakers. The school is located in the center of Athens and the student population is largely refugee/immigrant. This school, along with the Athens Intercultural Education High School, are the only schools in Greece that piloted the online program for the first time during the 2023-2024 school year.

Keywords: Akelius languages electronic platform, teaching of Greek, students with a refugee/immigrant background

INTRODUCTION

In recent years, the contribution of new information technologies to education, and particularly to intercultural education, has attracted the interest of researchers. The spread of ICT use in the educational field has been increasing rapidly in recent years**.** However, with the spread of ICT, various needs increase, such as teacher training and the renewal of technological equipment in schools, in order to achieve a complete and smooth integration of ICT into the educational system. At the same time, teachers face additional challenges in intercultural classrooms. The exploitation of the possibilities of new technologies emerges as the most appropriate cognitive development tool for the creation of a fruitful and advanced learning environment for students with different cultural characteristics. The intercultural approach presupposes the cooperation and interaction of individuals from different cultural groups and aims to overcome cultural differences, as well as to highlight common cultural elements. The role of the teacher in this intercultural effort of multicultural management of diversity is undoubtedly decisive and dominant.

The use of new technologies is considered an essential tool for modifying, reshaping and enhancing teaching content, curriculum objectives and textbooks. The introduction of digital technologies into an educational environment has the potential to improve student outcomes through various ways. The software can be designed to encourage personalized learning that is usually difficult to achieve in group teaching. In this paper, we will examine the learning benefits that the digital language course “Akelius languages” provides to students with a refugee/immigrant background, during the process of learning the Greek language.

THE BENEFITS OF USING DIGITAL TOOLS IN EDUCATION

Digital tools are defined as tools that include programs, websites, applications or other software available on digital devices (laptops, smartphones, tablets). In recent years, digital tools have been used in the teaching of various subjects, as the effective use of ICT in the educational process is a requirement of modern educational reality (Chatzimarinaki, 2022). The integration of new technologies and digital tools in education is considered to have occurred for two main reasons, due to the belief that education must follow technological developments and adapt to them, and because new technologies can offer benefits to both teachers and students. Some of these advantages are the promotion of social learning and collaboration, the increase in student motivation, the reduction of frustration and greater tolerance for error, the development of vocabulary in the target language (Giannoutsou, 2021). Digital tools allow for the personalization of the lesson, i.e. the adaptation of the lesson to the needs, interests and level of each student. The lesson is enriched with educational resources beyond the textbook, such as educational videos, e-books and interactive applications, expanding learning possibilities. The use of digital media helps students develop important digital skills that are essential in the modern world, such as using software, searching for information on the internet, and critically evaluating online sources. They also provide a way to cultivate the soft skills of critical thinking, problem solving, creativity, communication, and collaboration with peers and teachers. The integration of digital media in education makes teaching more enjoyable and playful, and therefore more creative for both participants in the educational process. Through digital tools, teachers can provide immediate feedback to students, helping them understand and correct their mistakes immediately. Digital learning can reduce costs for educational materials and books, as many digital tools and resources are either free or available at a lower cost than traditional educational materials. Therefore, we understand that the use of digital media can contribute to the creation of a more flexible, collaborative and personalized learning environment, preparing students for the challenges of the 21st century. (https://teacherwise.gr/i-chrisi-psifiakon-meson-stin-ekpaidefsi/). The use of digital tools responds to students' need for learning by doing and not so much by focusing on grammatical forms and rules (Giannoutsou, 2021). Compared to traditional teaching methods, where the role of students is passive, the integration of new technologies and multimedia enables interaction with native speakers and provides access to the most up-to-date information from around the world. This is a more student-centered pedagogical approach. Students have the opportunity to come into contact with authentic language, pronunciation and intonation and to imitate this way of speaking (Giannoutsou, 2021). In other words, authentic learning environments are created, connected to the experience and real life of the learners. In summary, modern digital technologies are shaping new ways and methodologies by which educators and learners search, gather, analyze, create, present and communicate information. At the same time, they provide new ways of distributing educational material, new tools for communicating ideas and new possibilities for collaboration among learners.

Despite all the benefits, teachers often face various challenges when trying to integrate digital media into their teaching. Some of these inhibiting factors for the use of ICT in teaching may be the school's inadequate logistical equipment, the teachers' own insecurity due to insufficient training in the use of ICT, the difficulty in identifying the appropriate educational software, the belief that they will need to devote a lot of their personal time to preparing teaching with ICT, the time pressure to cover the curriculum (Chatzimarinaki, 2022). At the same time, it must be acknowledged that the role of the teacher has changed with the integration of ICT in education. Teachers are called upon to acquire new

skills in order to cope with the demands of teaching with ICT. In particular, the teacher must now learn not only to handle various new electronic media, but also to act more as a guide to students, encouraging their autonomy and creativity (Chatzimarinaki, 2022).

THE USE OF DIGITAL MEDIA IN TEACHING THE INTERCULTURAL CLASSROOM

The term "interculturality" refers to a dialectical relationship, a dynamic process of interaction and mutual recognition and cooperation between individuals of different national immigrant groups. It is a means for social integration and the achievement of equality of educational opportunities. It is influenced by the children's own experience in the host countries and revises ethnocentric school criteria. In a multicultural and multiethnic society, intercultural education is considered the only solution, as it concerns an education of solidarity and empathy. Basic principles of the intercultural education model are respect for cultural diversity, teamwork, the elimination of nationalistic thinking and freedom from national stereotypes and prejudices, and the provision of equal opportunities (Pavlidou, 2019). The use of ICT in classes consisting of students with a refugee/immigrant background can contribute to implementation of the goals of intercultural education and to constitute a modern and effective means of supporting efforts to combat school failure and social exclusion experienced by foreign students, bringing about various positive results: cultivating communication and interaction between culturally diverse students, promoting collaborative learning, twinning of remote schools, opening the school to society through the use of the communication capabilities of ICT and the internet. In other words, new technologies assist the learning process, especially with regard to mastering the mechanisms of reading and writing the second or foreign language, developing oral skills and reducing hesitation in face-to-face conversation. New technologies are communication tools that provide multiple ways of accessing information sources, and their rational use can constitute an alternative perspective in teaching practice, especially in an intercultural classroom. At the same time, teachers are given the opportunity to plan their teaching by adopting new tools to create a more favorable learning environment for foreign language students (Pavlidou, 2019).

THE DIGITAL TOOL “AKELIUS LANGUAGES” IN INTERCULTURAL EDUCATION

Specifically in Greece, the Akelius program has been implemented in public schools and non-formal education units since June 2021 until today by the NGO "METAdrasi", in collaboration with and with funding from UNICEF. It is a digital language learning platform aimed primarily at refugee and immigrant students, but also more generally at those who want to learn one of the nine languages offered. It is a hybrid or web application, as it does not require installation on the device in question in order to be used. There is full access to the platform's content directly from the device's browser. It is also fully functional without requiring an internet connection, if it has been previously installed on the device. Based on the data so far, it appears that teachers consider the platform a very important tool for managing student heterogeneity, attracting interest, and evaluating.

In Greek schools, in areas where there is a majority of foreign-speaking students and the Akelius program is implemented, the difficulties that teachers most often face are related to time management, covering the curriculum, the connection of the platform's content with school textbooks, the existence of multiple levels of language acquisition within a class, school dropout and the handling of equipment(https://www.unicef.org/innocenti/reports/making-digital-learning-work). In the case of the 32nd Primary School of Athens, where the student population comes primarily from a refugee/immigrant background, the Akelius program was piloted during the school years 2023-2024 and 2024-2025, in four classes of the school. The platform was used by students online and each had an account on their personal tablet. There is also provision for a tablet for each teacher, which operates in teacher’s mode via special codes, so that the teacher can monitor the progress of the students. The care for the internet connection and satisfactory operating speed was one of the benefits of the program. The participating teachers were trained before the implementation of the program began, remotely and in person, both on technical issues of equipment management and on pedagogical and teaching issues. However, collaboration and guidance from the program managers continued throughout the school years, with monthly visits to schools, lesson supervision, and online meetings afterwards to discuss all possible challenges and difficulties. In this way, UNICEF and METAdrasi receive direct feedback from teachers on how to integrate the digital course into teaching, in order to provide advice, suggestions and solutions to potential problems. At the end of the year, participating students completed a program evaluation questionnaire so that the responsible bodies could record the results and make the necessary improvements. In this way, during its pilot operation, the program was co-shaped by both the teachers and the students who participated.

The content of the Akelius digital course does not follow the Detailed Curricula and school textbooks, but the language proficiency levels (A1, A2, etc.) and so far ends at level B2 (good knowledge, i.e. the student can speak and write with relative fluency, participate in discussions on a variety of topics and express themselves with more detail and spontaneity). The course material is structured around a number of thematic units related to various areas of daily life.

Each level is divided into 10 sub-units, each of which includes grammar and vocabulary activities, songs, games and quizzes. Depending on the score of each activity, students collect virtual "coins" and exchange them for equipment for their personal avatar, which motivates them, especially the younger ages (Images 1-3).

Image 1
Akelius platform internal structure

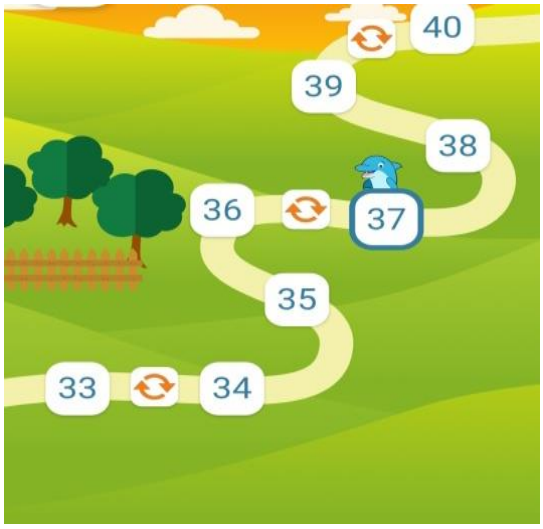

Image 2
Akelius platform home page image

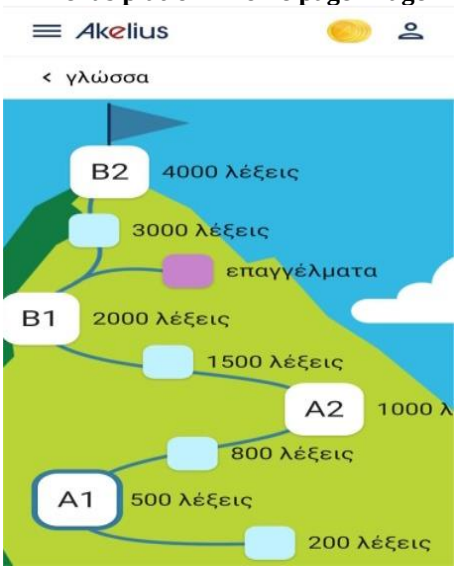

Image 3
Indicative sub-unit activities

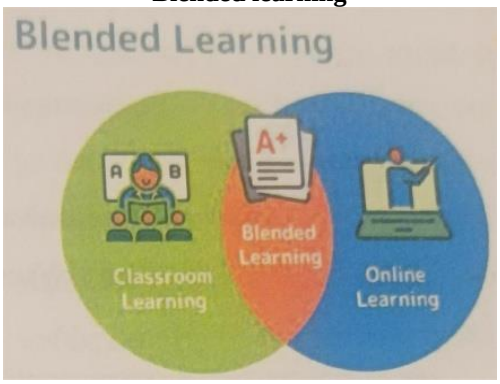

Image 4
Classroom storage and tablet charging station

Teachers are responsible not only for the planning and course of the lesson, but also for the management of the equipment. Students access the Akelius platform using their personal tablets and headphones, which have been provided by the program's responsible bodies and are kept in a locked cabinet in the classroom, which also serves as a charging station (image 4). The classroom teacher is responsible for charging the devices, storing them safely, and performing the necessary device and app updates. However, it is essential to teach students a routine regarding the proper use of the tablets, the cleanliness of the space, their safe transportation to and from their desks, and their safekeeping. Rules and routines create a positive blended learning environment, ensuring that equipment is protected, students are safe, and instructional time is managed properly. They also contribute to the development of digital skills, autonomy, and self-regulation for students (https://www.unicef.org/innocenti/reports/making-digital-learning-work).

With the use of Akelius, blended learning is applied to teaching, meaning that students follow at least partially some elements of the new knowledge online, in the classroom and not from home, so that they have some degree of control over the course and pace of teaching (image 5). In blended learning, online teaching and face-to-face teaching are interconnected in such a way that one continues from where the other left off (Anastasiou, 2023). The benefits that arise for students and teachers from blended learning are multiple and are related to the interactivity of the lesson, the personalized support of students, the personal pace of learning, autonomy, learning motivation and the playful and entertaining nature of the lesson. In other words, teaching becomes more student-centered, having its roots in constructivism, where each student is responsible for constructing new knowledge, which is based on their previous experiences, rather than teacher-centered (Hatziagapiou, 2020).

Image 5
Blended learning

The program is in line with the requirements of intercultural education, meaning that teaching is addressed to all students and their needs and incorporates the cultural background, existing knowledge and the daily experiences of children in the learning process in a way that allows students to understand themselves and others. (Anastasiou, 2023). However, as the content of the digital course does not follow the Ministry of Education's curricula, the teachers must plan on their own how to integrate Akelius into their lesson and which specific module and activity they will use each time.

Image 6
Students collaborating

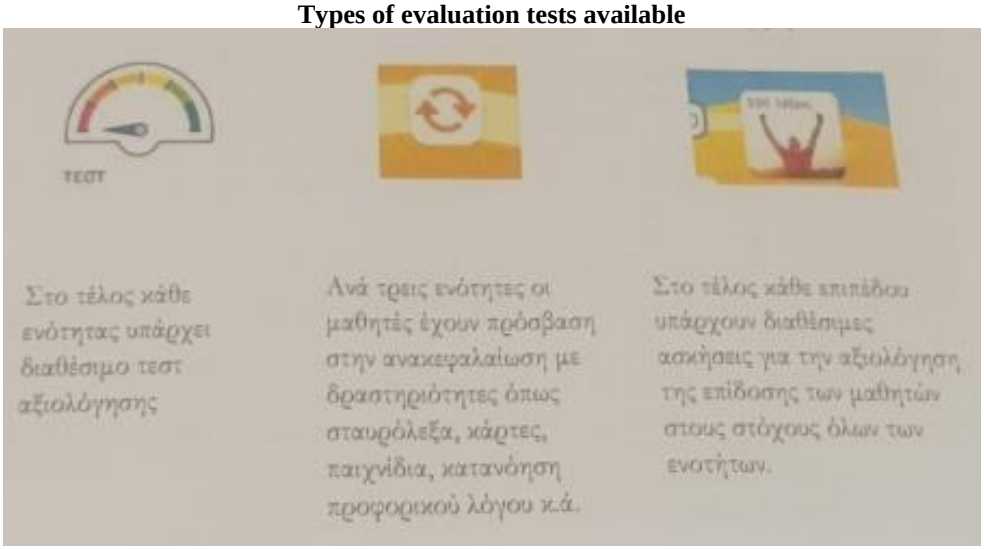

Image 7
Students collaborating

When teaching using the Akelius platform, it is preferable to arrange the classroom desks in groups (up to six people), in order to facilitate collaboration and interaction between students (images 6-7). The assigned activities may be collaborative or individual, but in any case discussion and mutual assistance are encouraged. After all, student interaction is the desired outcome of the intercultural educational model (Pavlidou, 2019).

Through the Akelius digital language course, students and teachers can choose among a variety of available tests and quizzes for the evaluation or self-evaluation of their progress, either at the end of each unit, or per three units, or overall at the end of each level (Image 8).

Image 8
Types of evaluation tests available

CONCLUSION

Rapid social changes have shaped the challenges and demands that education is called upon to respond to in recent years. Both the entry into a digital era and the population changes due to refugee and migration flows have brought about the necessity of readjusting Greek language teaching methods and integrating blended learning practices, intercultural education and the use of new digital tools. There is a need for a more student-centered teaching approach, where the teacher will have a guiding role. In this context, UNICEF, in collaboration with the NGO METAdrasi, have developed the Akelius program in public schools and non-formal education centers, since 2021. Positive features of the Akelius digital course include the attractiveness of the tool, its ease of use, the possibility of collaboration between students and the personalization of the teaching content, as well as the social aspect of the tool itself.

The use of the application, according to quantitative and qualitative research, has been associated with visible improvement in various areas of Greek language learning. Specifically, in a sample of 949 students, there was an 8% improvement in listening comprehension, 25% in speaking, 9% in reading and 34% in writing, compared to students who have not used the application, while there was no significant difference between the performance of boys and girls. Beyond the obvious and measurable benefits in learning the Greek language, students become familiar with the use of technological equipment, as the ability to autonomously use the devices within the context of the lesson is one of the requirements of the program. The difference therefore of this tool compared to other digital media used in the classroom is the interactive nature and the commitment required from students, who do not have a passive role, but actively participate in the process. At the same time, significant benefits have also been noted for teachers, which include better classroom management when using ICT, mastery of blended learning techniques and differentiation of teaching, better management of curricula and integration of Akelius into them, development of ICT skills and better guidance of students in their use.

ABSTRACT

This paper aims to highlight the effectiveness of the use of WebQuests as an Inquiry-Based teaching approach aligned with the principles of Inclusive Digital Education. The exploration and implementation of this method took place within the framework of the Erasmus+ project "Mediterranean Diet for Overall Health" (MedDiet4Health), which is an approved Erasmus+ KA210 initiative involving two Vocational schools in Greece (in the field of Agriculture, Food and Environment), one General Secondary School in Slovakia and a non-governmental organization (NGO) in Turkey.

This 18-month project aimed at designing a three-modules digital course that integrates the Mediterranean Diet into daily teaching practice. The course supports the Sustainable Development Goals (SDGs), with a particular emphasis on target 4.7 and the goals 2, 12, 14, 15 and 17, contributing to the development of learners' knowledge and skills for the promotion of sustainable development and lifestyles, cultural diversity awareness and the role of culture in sustainability.

Within this context, 60 WebQuests were developed, implemented by pilot students and redesigned in alignment with the principles of Inclusive Digital Education. These WebQuests explore the Mediterranean Diet both as an element of cultural heritage and as a sustainable, healthy dietary model, encouraging commitment to its values. Additionally, 20 more WebQuests were created to support the celebration of international awareness days connected to the project themes.

The paper presents the theoretical framework, the stages of development and implementation and the assessment tools used. It also offers a reflective analysis of the teaching practices applied during the project and presents the outcomes achieved.

Keywords: WebQuests, Mediterranean Diet, Inclusive Digital Education

INTRODUCTION

In the era of digital transition, education is called upon to meet the challenge of integrating Technology in ways that promote equity and inclusion, ensuring that no student is left behind regardless of his identity, background or ability (Mairal-Llebot et al.,2024). While digital transformation comes with its challenges, it also offers a valuable opportunity to modernize teaching practices by expanding access and enhancing student participation.

Within this context, Information and Communication Technologies (ICT) have become a key pillar in shaping an educational environment that fosters equity and inclusion. According to the European Union's "Digital Education Action Plan" the use of ICT in teaching can overcome geographical and cultural barriers, contributing to the creation of a more inclusive learning environment (European Commission, Directorate-General for Education, Youth, Sport and Culture, 2023). At the same time, digital learning tools respond to students' individual needs by enabling personalized feedback and supporting the development of self-regulation skills that are critical to their educational journey (European Commission, Directorate-General for Education, Youth, Sport and Culture, 2023; D'Elia et al., 2025).

Inclusive Digital Education emerges as a crucial approach that leverages the potential of digital tools to ensure equal and meaningful access to quality education for all learners (European Commission et al., 2021; UNESCO, 2021). It is based on theoretical models such as Universal Design for Learning (UDL), Multimodal Learning Theory and Vygotsky's Sociocultural Theory, which promote flexibility, variety in teaching tools and dynamic interaction between learners and their educational environment. Its principles are organized around four core pillars: a) accessibility and digital equity, b) differentiated and personalized learning, c) collaborative and participatory learning and d) digital empowerment and critical literacy (Helsper, 2012; Park, 2017).

Multimodal Learning Theory is particularly significant for differentiated instruction, positing that learning becomes more effective when information is presented through various formats, such as text, visuals, audio, video and interactive tools (Johler & Krumsvik, 2024). Its application is essential in Inclusive Digital Education, as it enables instructional adaptation to diverse students' needs, including learners with special educational needs (SEN). Digital technologies provide multimodal tools (e.g., audiovisual materials, interactive simulations, multimedia platforms) that allow students to choose the format that best supports their reception, processing and expression of knowledge (McIlroy, 2025). This approach is closely linked to the principles of UDL, which promotes equal access to learning through differentiated presentation, engagement and expression (CAST, 2018).

Universal Design for Learning (UDL) encourages the development of flexible learning environments that accommodate diverse learning needs. With the use of multiple media and forms of interaction, UDL ensures that all students, including those with learning difficulties, have equal opportunities to participate in the learning process (CAST, 2018). Within Inclusive Digital Education, UDL principles help adapt tools to each student's needs, enhancing inclusivity and personalization (Meyer et al., 2014).

Additionally, Vygotsky's Sociocultural Theory views learning as a dynamic process of social interaction, where the learner is not a passive recipient of information but an active participant in knowledge construction through engagement and guided support (Morcom, V., 2014). Central concepts such as mediation, scaffolding, internalization and inner speech are essential to inclusive education, facilitating students- especially those with special educational needs- to succeed with the right support (Goodman & Goodman, 2014; Mishra, 2013; Radford et al., 2015; Stasinos, 2013). These support processes enable students to overcome obstacles and develop their abilities, contributing to their social and psychological growth (Bickhard, M.A., 2013; Shabani, K., 2016). Vygotsky's theory has significant implications for educational practice. First, it encourages collaborative learning among students of varying ability levels, fostering rich learning environments where knowledge is built collectively. Second, it introduces the principle of gradually withdrawing support, allowing students to take increasing responsibility for their learning (Dlamini, R. (2023). When applied to computer-supported collaborative learning environments, this theory emphasizes the importance of support and personalization through technology. Mediation plays a critical role in Inclusive Digital Education, as technologies serve as tools that enhance learning, personalize instruction and help students overcome barriers (Fadeev, 2019; Morcom, 2014). Scaffolding is implemented through digital tools that allow educators to tailor instruction, supporting students' potential (Coleman & Rourke, 2010; Goodman & Goodman, 2014). Internalization is facilitated by interaction with digital tools, transforming social learning into individual knowledge and strengthening problem-solving skills (Dhingra et al., 2024; Shabani, 2016). Finally, inner speech is enhanced through digital tools that promote reflection, self-regulation and critical thinking (Shabani, 2016; Vladimirovna et al., 2020).

In this context, the present paper explores the potential of WebQuest as an innovative and effective teaching method aligned with the principles of Inclusive Digital Education and Universal Design for Learning (UDL). As an Inquiry-based learning strategy, WebQuest enables students to search, analyze and evaluate information from online sources while developing critical thinking, collaboration and digital literacy skills (Shaposhnikova et al., 2022). It is a student-centered approach that encourages learning in online environments, where teachers guide students through curated lists of relevant sources (Wang, 2021). Based on constructivism, the WebQuest model offers structured learning support (scaffolding), allowing students to draw on prior and current experiences to organize information and solve problems (Wang, 2021). WebQuests typically consist of five phases: (a) the introduction, which presents the topic and activates student interest, (b) the task, which defines the challenge, (c) the process, outlining activity steps with selected online resources (links, articles, videos, interactive material), (d) the evaluation, which sets assessment criteria and (e) the conclusion, offering opportunities for reflection and feedback (AlShamsi, 2024; Shaposhnikova et al.,2022). Through WebQuests, students engage in analytical and synthetic thinking while enhancing their logical reasoning skills (Cigrik & Ergul, 2010; Dodge, 2001).

This paper presents in detail the design, implementation and evaluation of WebQuests created within the Erasmus+ project "Mediterranean Diet for Overall Health" (MedDiet4Health) (Pr. numb.: 2023-2-EL01-KA210-VET-000183592). These WebQuests were applied in real educational settings to showcase the practical value and effectiveness of the method with a special emphasis on how the integration of Inclusive Digital Education principles and UDL enhanced the functionality and accessibility of the learning environment, contributing meaningfully to the equal participation of all learners. Based on data collected from classroom implementation, this work provides a well-grounded evaluation of outcomes and offers insight into how WebQuests can serve as a powerful tool for inclusive education, empowering teachers to design and deliver digital learning experiences that meet diverse learner needs.

METHODOLOGY

In the Erasmus+/eTwinning project *"Mediterranean Diet for Overall Health"* (MedDiet4Health), teacher from 3 countries, taking into account that: a) sustainable food systems have emerged as a global priority, since food production is directly linked to environmental degradation, including deforestation, water scarcity and carbon emissions; b) the growing global movement for sustainable food systems has made it essential for educational institutions to integrate this awareness into their curricula; c) schools are increasingly adopting interdisciplinary approaches that connect environmental science with students' everyday actions and choices (i.e. their dietary habits and routines), a fact that strengthens students' awareness and knowledge of the environmental impact of their actions, highlighting the critical role of nutrition in achieving a sustainable future; d) by linking nutrition, health and environmental education, schools can equip students with the necessary skills and knowledge to address these challenges, integrated these principles by combining cultural and environmental education with practical vocational training and digital education technologies, aiming to develop a comprehensive digital course utilizing the eTwinning/ESEP European School Education Platform.

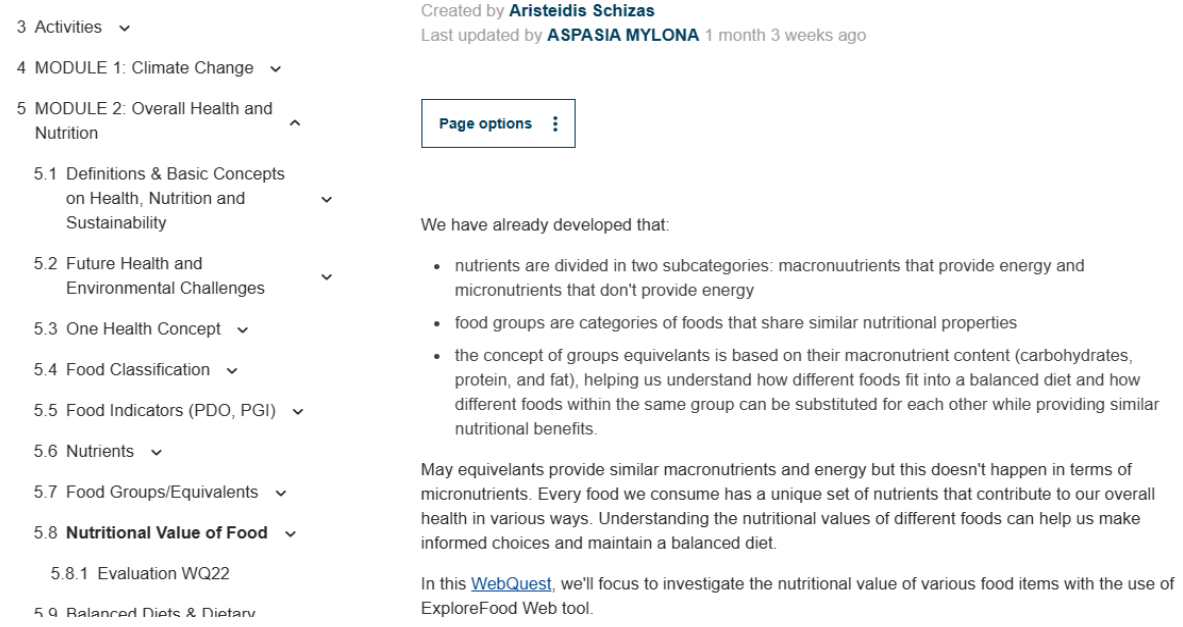
MedDiet4Health is a KA210 VET Erasmus+/eTwinning project that aims to explore: a) the role of food as a foundation of cultural identity and community continuity, through the values of hospitality, neighbourliness, intercultural dialogue and creativity, b) the role of greater adherence to the Mediterranean Diet in promoting environmental sustainability, c) a set of skills, competences, knowledge and practices required for job placement in the food system. The project's international partnership, which includes two Vocational Education schools from Greece, a General Education Secondary school from Slovakia and an NGO from Turkey, provides a culturally diverse platform for collaborative learning. Through the systematic use of digital educational tools and the implementation of the innovative STE(A)M methodology, the project aims to promote interdisciplinary learning and the development of sustainable life practices. This approach encourages students to think critically and creatively, integrating knowledge from various fields such as science, technology, engineering, arts and mathematics.

A digital course, structured in three modules, was collaboratively created by the partners, making use of WebQuests and applying the STEM (Science, Technology, Engineering and Mathematics), CLIL (Content and Language Integrated Learning) and IBSE (Inquiry-Based Science Education) methodologies. These methodologies not only enhance learning but also offer clear benefits for environmental education (Dillon & Herman). In total, 60 WebQuests were created, with 20 additional ones under development, focusing on themes related to the celebration of global awareness days connected to the project's topics. More specifically:

Module 1, entitled "Addressing Climate Change and Environmental Behavior with an Emphasis on the Environmental Dimensions of Food Production and Processing", consists of 15 WebQuests. It explores the complex and critical issue of climate change, investigating its causes, effects and profound impact on both human and planetary health.

Special emphasis is placed on the environmental dimensions of food production and processing, aiming to help students understand the complexity of this global challenge and explore sustainable solutions that promote both environmental and human well-being.

Module 2, entitled "General Health and Nutrition through the Lens of Sustainability, with an Emphasis on the Mediterranean Diet" consists of 18 WebQuests. This module revolves around key concepts and principles related to health, nutrition, and sustainability. Students will have the opportunity to deeply explore the rich cultural heritage of the Mediterranean Diet, along with its significant health benefits and its contribution to environmental sustainability.



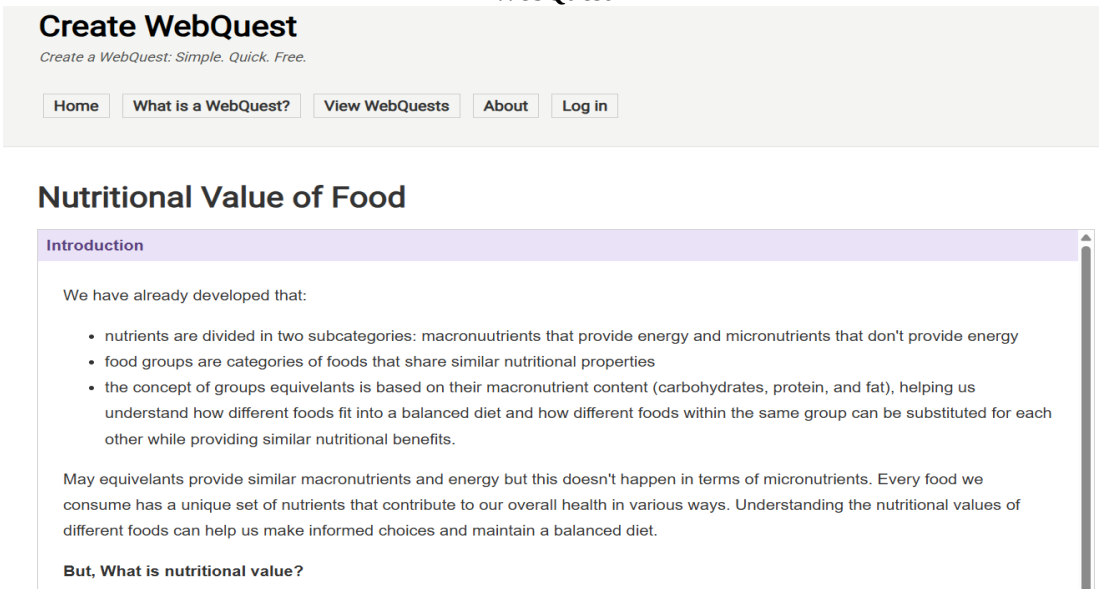
Module 3, entitled "The Mediterranean Diet as a Healthy Model for People and the Planet" consists of 27 WebQuests. Through an interdisciplinary approach, this module guides students to explore the cultural heritage, health benefits, and environmental sustainability associated with the Mediterranean Diet. The aim is to foster a holistic understanding of how dietary choices affect personal health and the environment, while promoting a deeper appreciation for the Mediterranean Diet as a model for overall health (One Health approach).

The digital course was implemented by pilot students and evaluated using Google Forms during the summer and up to the first in-person learning activity held from October 1st to 4th in Samsun, Türkiye, by students from the participating organizations. Based on their feedback, the course was adapted to reflect how and what students want to learn, considering the specificities of Vocational Education and Training (VET) as well as the special educational needs that some students may have. For this reason, the pilot group included students with special educational needs, among whom one with a hearing impairment.

INTERVENTION

This intervention, entitled "Nutritional Value of Food," was implemented within the framework of the Erasmus+/eTwinning project MedDiet4Health, as one of the collaborative activities hosted on the TwinSpace platform (Image 1).

Image 1.
The intervention "Nutritional Value of Food" on the TwinSpace platform

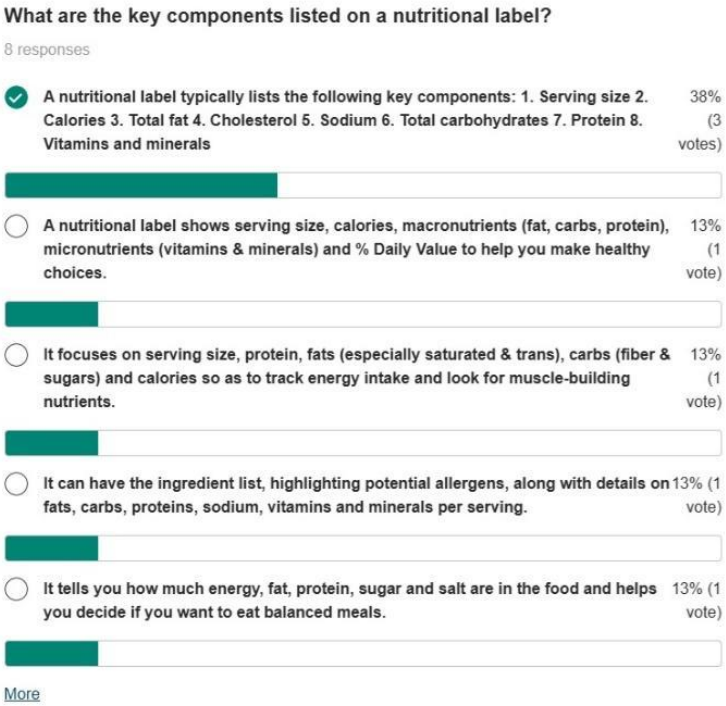


This specific WebQuest was created in the free 'Create WebQuest' platform and offers an innovative learning scenario that combines Inquiry- based learning, collaboration and the use of digital tools, aiming to promote nutritional awareness and foster critical thinking skills (Image 2).

It is addressed both to General and Vocational Secondary Education students and aims to explore the nutritional value of various foods, diets and recipes using the ExploreFOOD tool, as well as to create a nutrition label for a food item of their choice using the NutritionValue tool. This activity is suitable for multimodal and collaborative learning and can

be flexibly adapted to various educational contexts, giving students the opportunity to connect knowledge with their everyday life.

Image 2
WebQuest



Students begin by watching a short presentation (Image 3) so as to get informed about the nutritional value of food and the factors affecting it. For the presentation, web2.0 tool Genial.ly was chosen for its ability to provide flexible and interactive learning environments, stimulating student engagement regardless of individual skills. It is considered a powerful tool in Inclusive Digital Education, offering accessibility, differentiation, and collaboration. The presentation includes audio narration for students with reading difficulties and offers quizzes and alternative assessment methods through gamification.

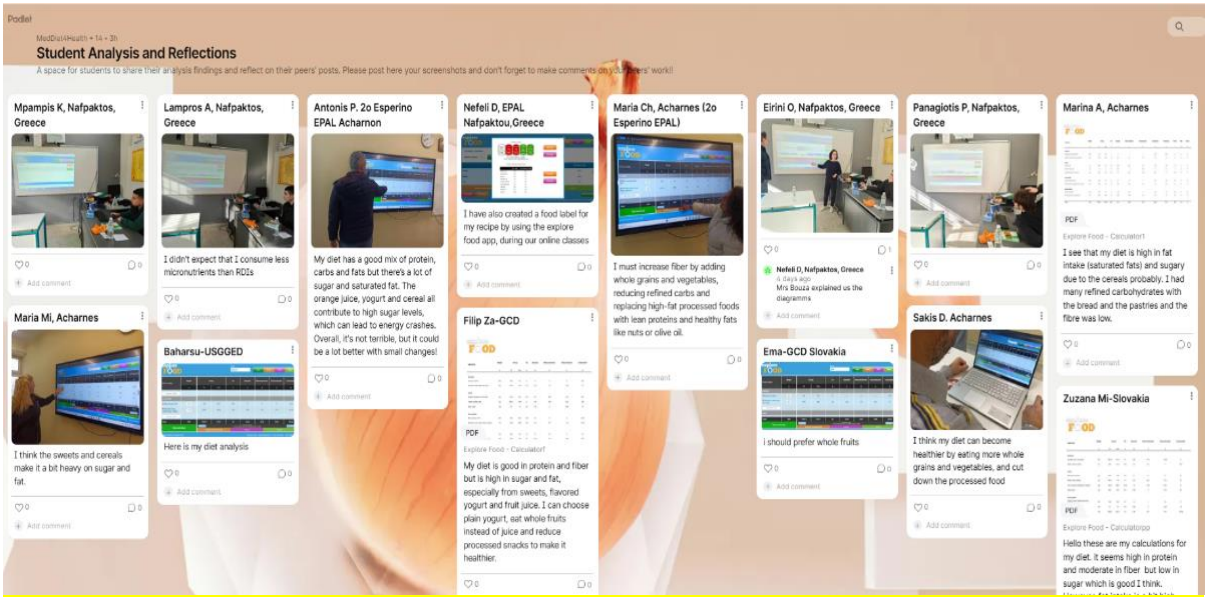
Image 3
Interactive Genial.ly presentation

A brainstorming session followed, using a TwinSpace poll (Image 4) regarding the key information typically found on food packaging concerning nutritional value. The use of the poll was intentional, as research shows it: a) encourages active student participation, b) promotes inclusion, c) provides a student-friendly assessment process, d) supports collaborative learning through class-wide discussion of the results.

Image 4
TwinSpace poll

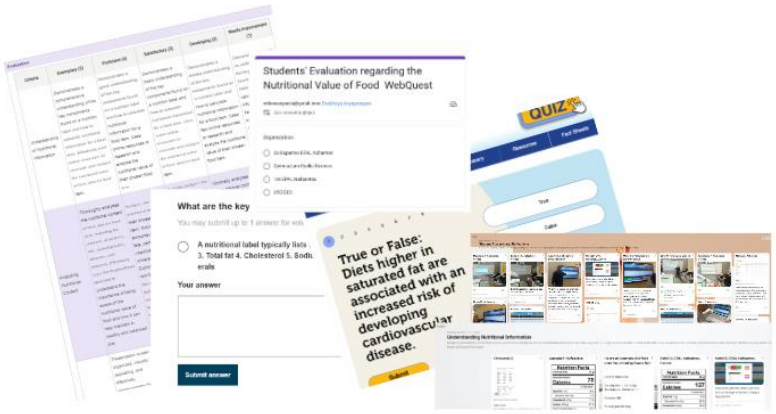
After the whole-class discussion, a follow-up conversation on food labelling was held. Students were given: a) a link to an interactive presentation on food labels using multimodal materials and simplified language (https://www.accessdata.fda.gov/scripts/interactivenutritionfactslabel/default.cfm) and b) a selection of relevant scientific articles, so that they have options for receiving the information and can be better prepared before designing a food label for a product of their choice.

During the knowledge construction and application phase, students were asked to: a) select and research the nutritional value of the foods of their choice using the tool at https://www.nutritionvalue.org/; b) design a nutrition label using either the same tool https://www.nutritionvalue.org/ or the platform https://explorefood.foodafactoflife.org.uk/; c) analyze a daily diet plan they had collaboratively designed using Google Docs, again making use of the Explore Food tool.



The instructions in the worksheets were detailed and clear and at the same time, students were given the option to listen to the instructions as audio (Image 5).

Image 5
QR code in the worksheet for audio instructions



Students worked individually and collaboratively in heterogeneous groups. Finally, they were given the opportunity to upload their final projects on collaborative platforms such as Padlet (Image 6), in different formats, encouraging them to read and comment on their classmates' posts.

Image 6
Collaborative Padlet

Regarding the evaluation, in addition to an initial assessment conducted by 11 students from all participating organizations, who piloted the activity to suggest possible design improvements, the following methods were used self-assessment/assessment with a rubric, which was included in the WebQuest and co-designed with the students prior to the activity, formative assessment using differentiated tools (e.g., observations, student reflections) and evaluation of the activity by the students via a Google Form. The multiple forms of assessment enhances student reflection, as learners are encouraged to think about their learning journey, identify their difficulties and plan their next steps. Ongoing feedback contributed to improving the overall learning experience, amplifying students' voices and fostering a culture of inclusion and active participation within the digital environment. Special attention was given to flexibility in response and evaluation options (Image 7), aiming to create valuable opportunities for the continuous monitoring of all students' progress, while considering their diverse needs and modes of expression.

Image 7
Evaluation options for students

DISCUSSION AND CONCLUSIONS

This paper has highlighted, in a well-documented and multidimensional way, the contribution of the WebQuest methodology to the advancement of Inclusive Digital Education, through its implementation in the European

Erasmus+/eTwinning project *"Mediterranean Diet for Overall Health" (MedDiet4Health)*. The use of WebQuests, as a learner-centered, inquiry-based and collaborative learning approach, in combination with the principles of Universal Design for Learning (UDL) and the application of multimodal digital tools, enabled the creation of a flexible, participatory and accessible learning environment for all students.

The implementation of WebQuests within the project demonstrated high functionality and effectiveness, both in terms of developing digital and metacognitive skills and in cultivating critical thinking and collaboration among students from diverse cultural and educational contexts.

The integration of differentiated and multimodal assessment tools (such as rubrics, recorded instructions, digital platforms, quizzes, collaborative documents, and commenting tools) showcased the potential of technology to support the diversity of learning profiles, enhancing the participation of students with special educational needs and/or lower language and digital skills.

Special emphasis was placed on reflection and feedback, which formed an integral part of the process, empowering students to become more self-aware learners. Self-assessment, open expression of personal thoughts, and flexibility in the presentation of final projects highlighted the importance of the student voice in contemporary digital education, reinforcing democracy and inclusion in the school environment.

The use of WebQuest as an instructional strategy within the *MedDiet4Health* project can serve as a model of good practice, especially in the field of Vocational Education and Training (VET), where the connection between theory and practice, digital innovation, and cultural awareness is of central importance.

FINAL REFLECTIONS

The integration of WebQuests in inclusive education comes with certain challenges that require continuous adaptation and improvement. A major issue concerns linguistic accessibility, as activities must be formulated in simple and comprehensible language, while translation tools or text-to-speech features are also considered valuable for students with language or reading difficulties. At the same time, managing technological resources remains a challenge, particularly in ensuring equitable access to the internet and the permitted use of mobile devices within school settings. Finally, the personalization of activities continues to be a critical success factor, demanding flexibility in learning options and differentiated opportunities tailored to the interests and needs of each student.

The practical implementation of the project demonstrates that inclusive digital education is not a utopian or abstract concept, but a realistic and meaningful pedagogical approach that can offer all students equal opportunities for learning, growth, and personal empowerment. When WebQuests are well-designed, they can effectively serve the principles of Inclusive Digital Education, provided they are developed with a focus on accessibility, diverse learning needs, and the use of multimodal content.

The continued use of methods such as WebQuest, especially when combined with collaborative and intercultural frameworks like Erasmus+, can pave the way for a more inclusive, sustainable, and innovative educational future.

A NEW APPROACH TO TEACHING NEW TECHNOLOGIES BASED ON FI AND FD COGNITIVE STYLES

Maria Chatzikyrkou

Apostolos Tsagaris
International Hellenic University
Thessaloniki, Greece
e-mail: tsagaris@gmail.com

ABSTRACT

This proposal aims to highlight a new approach for the effective teaching of Robotics and New Technologies. To ensure a successful process, it is proposed to diagnose the learning styles of the learners and then to provide differentiated teaching that will achieve the intended inclusion and maximize learning outcomes. For this reason, the most well-known bipolar contrast regarding cognitive learning styles will be used, the one proposed by Witkin and his colleagues (1977) and distinguishes learners into two bipolar categories, namely those who learn without depending on their environment (Field-Independent Learners = FI) and those who make learning directly dependent on their environment (Field-Dependent Learners = FD).

Witkin and his colleagues' research led to the creation of a diagnostic tool, the Group Embedded Figures Test (GEFT), which measures the presence of the bipolar FI/FD characteristics in learners, and defines which of them tend towards the first and which towards the second category. Related research has shown that FI learners prefer to learn better by utilizing traditional means compared to learners belonging to the FD category. The latter are more influenced by their social environment than by their personal motivations, as well as by praise and criticism compared to FIs, who are more productive and egocentric, solve problems through intuition and utilize "true-false" testing strategies.

The different Cognitive Learning Style that each student possesses is part of the fundamental assumption that each child is unique, which means in simple words, various differences in cognitive and social development between children. Given that these characteristics affect learning, the field of Differentiated Teaching is considered one of the most appropriate educational approaches to manage all forms of diversity in the modern classroom, which aims to offer learning for each child individually, taking into account their particularities in the construction of knowledge and teaching. Therefore, Differentiated Teaching is a modern, child-centered and promising approach that includes many innovative approaches and at the same time a challenge for researchers and educators.

Teaching new technologies on the other hand is essential to prepare students for the future, develop their skills and create a digitally literate and innovative society. Living in a digital age, where technology permeates every aspect of life, students need digital skills to succeed in education, work and society and to equip themselves with the necessary knowledge and skills to meet the demands of the 21st century. After all, new technologies offer tools and platforms that encourage critical thinking, analysis and problem solving so that students learn to evaluate information, make decisions and create innovative solutions. Finally, teaching new technologies helps students develop digital literacy, that is, the ability to use technology responsibly, safely and ethically and to protect their privacy, recognize misinformation and avoid the dangers of the internet. In summary, this proposal analyzes the components of two learning styles, those who learn dependently on their environment and those who learn independently. Then, the method of planning activities based on differentiated teaching is explained so that the learning process is effective.

Keywords: Field-Independent Learners, Field-Dependent Learners, Cognitive Learning Style

INTRODUCTION

In recent years, research in the field of education — and specifically in the area of language development- has focused on students' learning styles as one of the key factors contributing to effective teaching and learning (Lin, 2023).

The most prominent experimental study was conducted by Witkin (1971), aiming to examine students' perceptual skills in relation to their personality, as a result of different ways of adapting to the world. According to Witkin (1977), cognitive style is a form of mental functioning that appears in an individual's intellectual and perceptual activities. In short, cognitive learning styles are related to the internal cognitive characteristics of the learner in processing information and are linked to the learners' responses to the broader environment (Witkin et al., 1971; Witkin et al., 1977).

An important classification of cognitive learning style, which includes an intuitive and analytical dimension of learning, is the Field Dependent and Field Independent learning style introduced by Witkin and Fellows (1977). These represent two fundamental domains of cognitive learning, which reflect the way in which pattern recognition is processed and retained in memory. According to Witkin's scientific interpretation of field dependence and independence, a person's ability to identify a simple figure within a more complex one is considered a field-independent trait, while individuals who struggle to detect such details are characterized as field-dependent (Grigorenko & Sternberg, 1995). More specifically, in field-dependent pattern recognition, the parts of a whole are perceived as "fused together," while in field-independent processing, the individual is more likely to perceive the parts as distinct from the organized background (Witkin et al., 1971).

Messick, in turn, found that field dependence occurs when a student's perception is strongly influenced by the surrounding environment, whereas field independence arises when a student perceives more or less regardless of the environment (Messick, 1984).

Extensive research conducted on these two cognitive learning types has shown that the learning style to which each student belongs significantly influences their academic performance, particularly in problem solving. Problem solving can be defined as the generation of new problems and mathematical questions, and the reformulation of those problems may effectively lead to their solution. However, most study results indicated that field-dependent individuals performed worse in problem-solving tasks compared to field-independent individuals. This is mainly due to the latter's ability to break down a problem into smaller parts and their particular skill in noticing problem details.

Silver and Cai (1993) found a strong relationship between mathematical ability and the capacity to solve and pose problems, indicating that mathematically capable students can also generate problems. Additionally, in terms of personality development within each group, field-dependent individuals tend to rely more on others, and their interpersonal and communication skills are more developed compared to field-independent individuals. This type of personality suggests a more systematic learning style. On the contrary, field-independent individuals are more competitive and self-reliant, showing individual interests and more advanced skills in problem-solving and hypothesis testing.

In conclusion, Witkin and Goodenough (1981) found that child-rearing practices are influenced by whether an individual has a field-dependent or field-independent cognitive style, as family environments shape this orientation early in life, and parental authority encourages more or less dependency accordingly.

STATE OF THE ART

Research interest in cognitive functioning and cognitive learning style has emerged as a result of efforts by cognitive and developmental psychologists to clarify the processes underlying the individual differences in learning styles(Kozhevnikov et al., 2014). According to Habieb-Mammer et al. (2001), cognitive styles act as strong variables that influence students' academic performance, such as professional preferences, continuous academic development, teaching methods, and the interaction between students and teachers within the classroom. Cognitive style is described by many scholars as an aspect of personality that influences attitudes, values, and social interactions (Davis, 2006).

The most well-known and dominant approach to cognitive style is the Field Dependent / Field Independent learning style. As previously mentioned, these are two opposing learning styles, referring to the individual's ability to perform perceptual tasks (Riding & Cheema, 1991). Witkin's research showed that field-dependent individuals perceive the environment more holistically—students dependent on their surroundings "see the forest", whereas field-independent individuals are able to distinguish elements as separate from the field—they "see the tree within the forest" (Hasanah & Masduki, 2024).

Witkin and his collaborators developed several tests over time to assess each student's cognitive learning style. In fact, Witkin dedicated much of his academic career to developing various measures of learning style. The Group Embedded Figures Test (GEFT) is the most widely used version for measuring cognitive style. It was created by Witkin, Oltman, Raskin, and Karp, aiming to offer a more adaptable version of the Embedded Figures Test (EFT) for group administration. The GEFT places the individual on a continuum between field dependence and field independence (Witkin et al., 1971).

The test has a covert evaluation structure, in which a series of simple figures is embedded within a more complex pattern. It includes three parts: the first part, considered introductory, consists of seven tasks. The other two parts are scored and include nine tasks each. In total, it contains 18 complex figures, where the participant must identify a simpler shape within 20 minutes. It can be administered individually or in groups to children and adolescents. Participants are given instructions to describe the shapes they identify. Scores range from 0 (lowest) to 18 (highest).

Because the scores from the field dependence/independence test form a continuous distribution, they reflect a tendency toward one perceptual orientation or the other. Therefore, lower scores indicate difficulty in locating simple figures and lower restructuring ability, characteristic of field-dependent learners. Higher scores belong to field-independent learners, reflecting greater ability to detect simple figures and stronger restructuring skills.

Finally, Boyd, Westfall, and Stasch (1985) argue that this is a preferred method for assessing cognitive learning style, as students are unaware of the test's subject matter and therefore are not biased in their responses by prior knowledge.

METHODOLOGY

The purpose of the present study is to investigate the impact of Field Dependent / Field Independent (FD/FI) cognitive learning styles on the teaching of educational robotics to preschool children, using the GEFT educational tool and through the design of an appropriate educational scenario.

The usability of the methodology will be examined based on five key usability dimensions:

- Effectiveness,
- Efficiency,
- Satisfaction,
- Ease of Use, and
- Ease of Learning,both from the perspective of the learner and the instructor.

The research is guided by the following research questions:

- Is usability influenced by gender (boys/girls)?
- Is usability influenced by learning style (Field Independent / Field Dependent)?

The sample consisted of 40 preschool children, including 16 girls and 24 boys, aged 4 to 6 years. The questionnaire was completed by the children with the help of their teacher. Sampling was conducted using the simple random sampling method, and the sampling frame was the list of enrolled children in kindergartens. The children who participated had no prior experience with the Bee-bot robot.

It is important to note that anonymity of the participants was maintained to ensure ethical integrity and data privacy. The research was based on the standardized "Mechatronic System Usability Evaluation" questionnaire, designed and developed by Apostolos Tsagaris (Tsagaris, 2023). This tool assesses the usability of educational robotics systems used by educators, in order to collect the opinions and experiences of participating teachers. The data was then statistically processed, leading to the formulation of conclusions, while the researcher also conducted observations, using a pre-designed observation form based on the same framework.

EXPERIMENTAL RESULTS

Out of the 40 students, 26 were introverted and belonged to the Field Dependent (FD) learning style, while 14 were extroverted and belonged to the Field Independent (FI) learning style. Therefore, the majority of students in the sample tend to be field dependent (FD) rather than field independent (FI).

Furthermore, regarding learning style by gender, 15 boys were identified as FD and 9 as FI, whereas among the girls, 10 were FD and 6 were FI. We can conclude that more boys tend to exhibit an FD learning style compared to girls.

Research Question 1: Is usability influenced by gender (boys/girls)?

It was observed that girls showed slightly higher response scores across all usability categories, with the greatest differences appearing in effectiveness and satisfaction. Additionally, ease of use and learning was found to be nearly identical between genders; however, boys showed greater variability in learning scores compared to girls.

The mean values for each group were found to be very close, indicating that usability may not be influenced by gender—a finding that was further examined through statistical analysis.

Normality Test

A normality check was first performed for the mean usability responses of each gender group. In both tests, the p-values were greater than 0.05, indicating that the null hypothesis of normality is not rejected—that is, the data follows a normal distribution for both groups.

T-Test for Equality of Means

To determine whether there is a statistically significant difference between the mean usability scores of boys and girls, a hypothesis test was conducted using the t-test, as follows:

H_0 (null hypothesis): The mean values are equal ($\mu_1 = \mu_2$)

H_1 (alternative hypothesis): The mean values differ ($\mu_1 \neq \mu_2$)

The test results showed that the variances of the two samples (boys, girls) are equal, and the p-value for the equality of means was 0.125, which is greater than 0.05. Therefore, we do not reject the null hypothesis at the 5% significance level, meaning that the means do not differ significantly—with at least 95% confidence, we conclude that usability is not influenced by gender.

Research Question 2: Is usability influenced by learning style (FI/FD)?

It was observed that field-independent learners (FI) showed slightly higher response scores across all usability categories, with the largest differences appearing in satisfaction and ease of use. Additionally, effectiveness, efficiency, and ease of learning were nearly the same across both learning styles. However, among field-dependent learners (FD), greater variability was found across all categories except for effectiveness, where the variability was lower.

The mean values for both groups were close, suggesting that usability may not be influenced by learning style, though this observation was further tested statistically.

Normality Test

A normality test was first conducted on the mean usability scores for each learning style group. The p-values were greater than 0.05, indicating that the null hypothesis of normality is not rejected—thus, the data can be assumed to follow a normal distribution in both groups.

T-Test for Equality of Means

To determine whether the mean scores differ significantly between learning styles, a hypothesis test was conducted using the t-test, as follows:

H_0 (null hypothesis): The mean values are equal ($\mu_1 = \mu_2$)

H_1 (alternative hypothesis): The mean values differ ($\mu_1 \neq \mu_2$)

The test results showed that the variances of the two samples (FD and FI) are equal, and the p-value for the equality of means was 0.055, which is slightly above 0.05. Therefore, the null hypothesis is not rejected at the 5% significance level, meaning that the mean scores do not differ significantly.

Thus, we conclude that usability is not influenced by learning style.

DISCUSSION

Research Question 1: Is usability influenced by gender (boys/girls)?

By comparing the usability levels of girls and boys after collecting and analyzing their observation data, it was found that the mean scores of the observations were 3.77/5 for girls and 3.69/5 for boys, which appear to be nearly identical. The variance analysis showed that the learning rate among boys varied more from individual to individual, while girls demonstrated greater consistency. The distributions of the two observation samples were found to be normal, and the test for equality of means was statistically significant, providing at least 95% certainty that usability is independent of gender.

Research Question 2: Is usability influenced by learning style (FI/FD)?

By comparing the usability levels of field-independent and field-dependent learners, the mean observation scores were found to be 3.78/5 and 3.68/5, respectively—again showing very little difference. The variance analysis indicated that usability among field-dependent learners varied more from person to person, while field-independent learners showed greater consistency in observations. The distributions of both samples were normal, and the equality of means test was statistically significant, providing at least 95% confidence that usability is independent of learning style.

Overall, the study concludes that educational robotics tools, such as the Bee-bot, are highly usable by children and can be effectively used regardless of gender or cognitive learning style. For future research, a factor that could play a more central role is the child's prior experience with educational robotics systems, as levels of familiarity with technology may vary significantly.

Additionally, the subject of educational robotics is progressing rapidly at the preschool level, demonstrating that its usability is being successfully embraced by educators. Therefore, it is clear that this research has multiple implications and can contribute to the improvement and wider adoption of educational robotics in early childhood education.

CONCLUSION

In the present study, an attempt was made to evaluate the usability of a proposed educational methodology related to the teaching of educational robotics to preschool children, utilizing the different FI/FD learning styles. The central figures in this usability evaluation were both the learners (children) and the instructors (educators).

More specifically, the methodology was based on an educational scenario using the Bee-bot robotic tool. The research was conducted in a two-class public kindergarten, and the sample consisted of 40 children, both boys and girls. With the help of the GEFT educational tool, this sample was divided based on cognitive learning style into Field Dependent (FD) and Field Independent (FI) learners. From the total of 40 children, 32 were randomly selected to participate in the usability evaluation of the specific methodology in relation to gender and learning style.

In more detail, based on the answers of the 40 children to the introversion–extroversion questionnaire and the use of the GEFT tool, the study's findings showed that most students tend to be field-dependent (FD) rather than field-independent (FI). This leads to the conclusion that most children learn through their environment, relying more on others, and exhibiting stronger interpersonal and communication skills. Regarding gender, the majority of field-dependent learners were boys, which was expected given that there were more boys than girls in the sample.

Before comparing usability scores across different groups, it was generally observed that the children demonstrated high ease of use and ease of learning with the system, compared to lower levels of efficiency in completing tasks.

ABSTRACT

This paper presents a teaching proposal developed in the context of language education for third grade students in the Greek senior high school (Lyceum) on the topic of gender-based violence, considering the requirements of the new curriculum for language education in the Greek senior high school (Lyceum). The project is based on the use of Information and Communication Technologies (ICT) in language education and is implemented through a WebQuest structured according to the model proposed by Dodge (1995). The purpose of WebQuest is to familiarize students with authentic language material and to work collaboratively and creatively on a topic that is familiar to them and sparks their interest. The first section provides a theoretical introduction to the use of the Internet in language teaching, followed by a brief explanation of the term "WebQuests" and a presentation of the six phases of this teaching proposal.

Keywords: Language Education, Internet, Critical Literacy, WebQuests

INTRODUCTION

In recent years, the integration of digital technologies into educational practice has transformed the landscape of language teaching and learning. The increasing accessibility of the internet has not only enriched the variety of authentic language materials available to teachers but has also opened up new opportunities for student engagement, critical thinking and collaborative learning.

In the context of secondary Greek education, especially in the third year of senior high school (Lyceum), there is an increasing need to align language teaching with real-world issues and the evolving literacy of the digital age. The revised curriculum (2021) for language teaching encourages the development of critical reading and writing skills and emphasizes students' ability to interpret, evaluate and respond to complex social texts and phenomena.

In this context, the definition of literacy has expanded significantly, as it is now viewed as a socially situated practice rather than a purely technical skill. Text is placed at the center of language education, not merely as a vehicle for communication, but as a construct shaped by social purpose and discourse conventions. As Cope and Kalantzis (1993) point out, Genre can be understood as a category that links the social purpose of a text to its linguistic structure. Consequently, effective literacy education requires students to critically examine the various social purposes underlying recurring patterns in language — essentially, to understand both the reasons for and the mechanisms behind textual conventions. The pursuit of this goal is understood as a socially oriented process aimed not only at the effective use (production and comprehension) of discourse, but also at the formation of a critical attitude towards any text structure. This is also the context of the Modern Greek Language curriculum for grades A, B and C of the Greek senior high school (Lyceum) (Institute for Education Policy, 2021), which typically states that "The subject of Modern Greek Language contributes decisively to the preparation for active participation in social and political life, the formation of social empathy and the status of an academic citizen and/or a future professional".

The development of technology has expanded the concept of literacy, namely the effective use of technological means. This has led to an expanded concept of literacy that includes the ability to use technological media. Therefore, the use of technological media in language education is considered essential in a course based on the principles of critical literacy.

One of the most widespread technological tools is the internet, which in recent decades has entered most areas of human activity, including education. It offers enormous potential in the fields of information, work, entertainment and science (Gkaravelas and Christou, 2012). By providing easy access to information from anywhere in the world, given the necessary technical conditions, it has reduced the distances between people and helped more people to share common experiences. This is an important fact for those involved in the design and implementation of educational programs today, because, until a few decades ago, geographical isolation was an extremely important differentiator that significantly influenced the academic development of students. For example, a study by Danassis-Afentakis (1988) found that the highest percentage of high-achieving students were born in Athens and in the capital cities of prefectures and provinces, while in a study conducted by Tzani (1988), it was found that in schools in underprivileged areas — where the environment is less supportive compared to public model experimental schools and schools in more developed urban areas — the number of high-achieving students is significantly lower, while the number of low-achieving students is significantly higher. Of course, this does not mean that the differences between students from urban and remote or non-urban areas have been eliminated. On the contrary, according to recent research, it seems that they still exist (Gkaravelas, 2019; OECD, 2024). However, we believe that this gap has narrowed to a certain extent, mainly due to the opportunities offered by the internet. However, the vast amount of information can easily tempt students into incessant and pointless searching (Gkaravelas and Christou, 2012). WebQuests offer a way out, as they are complex teaching/learning contexts that promote students' self-activity and activation through targeted and guided use of the internet (Dubs, 1996).

The advantages of WebQuests as a teaching tool are manifold and mainly related to the working context it provides. Even if the topic is not of great interest to the students, the working context (internet) is something that most students are familiar with, which makes the process even more interesting. Furthermore, WebQuests offer the possibility for students of different levels and heterogeneous groups to work, as there is the possibility to choose different activities even within one topic (Nárosy and Riedler, 2003). At the same time, as a group and participatory learning process, WebQuests offer students the opportunity to take on roles within the group, which acts as a learning stimulus (Vakaloudi, 2014). Finally, WebQuests offer students the opportunity to work on issues that are relevant to their lives through the authentic material they work with and the relevant real-life problems they are asked to deal with (Gkaravelas and Sevi, 2018).

This paper presents a teaching proposal that utilizes the WebQuest model to address the socially pressing issue of gender-based violence, within the framework of language education for the third grade of Greek senior high school (Lyceum). The proposed web-based activity, entitled "Gender-Based Violence", reflects the increasing concern over the recent rise in such crimes, which often escalate into femicides. Grounded in the principles of critical literacy and the integration of Information and Communication Technologies (ICT) in education, the intervention aims to enhance students' language skills, critical thinking, and social awareness through structured, technology-enhanced inquiry. By engaging with authentic online resources and working collaboratively, students are invited to investigate and justify the causes, forms, and consequences of gender-based violence and to propose viable, well-informed solutions. This project serves as an illustrative example of how the Internet can be meaningfully integrated into language education to promote both learn about an important social issue and think critically about it.

THE TEACHING PROPOSAL

Compatibility of the teaching proposal with the new modern Greek curriculum of the senior high school (Lyceum)

This teaching proposal has been designed to comply with the principles of the new upper secondary school curriculum (2021). This curriculum emphasizes learning in contexts where students can develop their independence and creativity and work in a differentiated way (Institute for Education Policy, 2021:15). Significantly, one principle of the school curriculum is stated as the student-centered approach, with an emphasis on discovery, cooperative, and action-based learning through the creation of situational environments to ensure student participation in educational practice (Institute for Education Policy, 2021:6).

The instructional proposal is also consistent with the overall goal of language instruction in high school. Significantly, the curriculum states that texts and the processes associated with them (reading and comprehension, analysis, interpretation, response, transformation and creation) are central to the aim of Modern Greek language education in the senior high school (Lyceum) (Institute for Education Policy, 2001:9). The proposed activities should always be placed in a communicative context with the aim of understanding, interpreting, analyzing and creating authentic discourse, and the texts should correspond to the students' interests and be accompanied by audiovisual material (Institute for Education Policy, 2019).

DESCRIPTION OF THE WEBQUEST

The proposed WebQuest, posted on a relevant platform (https://www.createwebquest.com/emfyli-bia), is a multimodal text, as the messages are conveyed in different semiotic ways (text, image, photo). This teaching proposal was designed based on the six phases of WebQuests proposed by Dodge (1995) and is presented below:

1. The first phase is the introduction, in which the topic to be covered is presented briefly and engagingly. The following wording was chosen for the proposed WebQuest:

Incidents of violence and crime, in whatever form - physical or psychological abuse, murder, rape, domestic violence, bullying, cyberbullying, theft, vandalism, arson, kidnapping, hooliganism, organized crime - are understandably all part of it. They undermine the possibility of harmonious social coexistence and have a significant psychological impact on those confronted with their various manifestations or the consequences thereof, as the use of violence against one person also has an impact on those in their immediate environment. (https://latistor.blogspot.com/2017/01/blog-post_30.html). One form of violence is gender-based violence, which has been on the rise in recent years.

2. Below you will find a report on the individual activities. This stage is about clearly formulating the individual questions that students should work on in their own way. These questions should target specific outcomes. The specific activities can include interactive, open or closed exercises to support the process. The following wording was chosen for this WebQuest in this second step:

Unfortunately, in recent years there has been an increase in gender-based violence crimes, often even resulting in homicide. At a conference organized by your municipality on the International Day for the Elimination of Violence against Women on 25.11., you have to analyze your positions on the following topics (300-350 words):

- the factors leading to the rise of the phenomenon
- the forms and consequences of the specific problem
- the proposed solutions to this important problem (words).

3. The next step is to define the process, which includes, among other things, the selection of the individual steps by the participants, the distribution of tasks among the members of the groups and the definition of a timetable for the completion of the process. In this WebQuest, the steps are described as follows:

Step 1: You will be divided into three groups of three people each. Each group chooses one of the three topics! (causes/forms and consequences/solutions).
Step 2: Each group will collect information on their topic. You have 20 minutes for this phase.
Step 3: Groups will discuss the results and prepare their presentation based on the material collected. You have 30 minutes for this phase.
Step 4: The groups will present the collected material to the rest of the class. Each group has 7 minutes to present their work to the rest of the group.
Step 5: Evaluation - discussion of the presentations (details can be found in the evaluation phase).
Step 6: Each student will write a text (essay) of (approximately) 350 words, depending on the group in which they participated.

4. The fourth stage of the teaching proposal is the presentation of the resources available to the students. These can be specific predefined websites but also pages from the textbook or anything else that can be used as teaching material. Students can find their own resources but should describe them in the presentation. The platform hosting the proposed invention does not have a predefined area for the resources. However, as they are an essential part of a WebQuest they have been listed at the end on the teacher's page of the used platform. We have used the following sources:

https://diotima.org.gr/services/via-kata-ton-gynaikon/

5. In the penultimate step, the students are informed about how and according to which specific criteria the evaluation/assessment of the process should take place. There are different ways to evaluate a WebQuest. In some cases, assessment grids combining qualitative and quantitative assessment are suggested, while in other cases a simple discussion on a specific topic is suggested. Based on the published examples, most WebQuests have their own way of evaluation, while others have none (WebQuests.ch, WebQuests.de). In the case of assessment, we believe that the method should be determined either by the teacher alone or in collaboration with the students and that it is very important that the students know in advance the criteria on which the assessment will be based (Gkaravelas and Sevi, 2018). For this teaching intervention, a discussion with qualitative features on two axes was chosen:

A. Content (e.g. suggestions for deficits)
B. In relation to the process (e.g. problems, suggestions, etc.)

The most interesting thing is that students think critically and discuss the work they have already done. In this way they will highlight their effort and improve possible weaknesses.

6. The conclusion of the process: The final step includes a report on the positive consequences of the students' research work in class. A summary report of what the students have learned follows at the end of the presentations. Preliminary formulations along these lines are as follows:

In the process we have just completed:
- You were informed about the dimensions of gender-based violence
- You have worked in a focused and organized way, individually and in groups.
- You found, selected, organized and presented your material.
I hope you found the process interesting!

To assess the effectiveness of the WebQuest-based learning activity, we employed a structured evaluation rubric with a quantitative approach (Table 1). The rubric includes three evaluation criteria: Organization, Content Understanding, and Orthography/Grammar/Syntax. Each criterion is rated on a scale from 1 to 4, with 1 representing the lowest level of performance and 4 the highest. The total score provides an overall indication of the students' performance during the webquest. Each criterion is assigned a score between 1 and 4. The final score is the sum of the three individual scores, allowing for a maximum of 12 points. This quantitative assessment offers a reliable method to evaluate student engagement, comprehension, and expression during webquest activities.

Table 1
Evaluation Rubric for WebQuests

Criteria	1	2	3	4	Scores
Organization	The students cannot understand the information presented.	The students make a great effort to understand the information.	The students understand the information.	The students understand the information very well.	
Content	The student has not understood the content and cannot answer questions on the topic.	The student has difficulties with the content and can only answer basic questions.	The student understood the content but cannot make connections to the topic.	The student has understood the content, can make connections and explain them.	
Orthography / Grammar / Syntax	The text contains many orthography, grammatical and syntax errors.	The text contains several orthography, grammatical and syntax errors.	The text contains only a few orthography, grammatical and syntactical errors.	The text contains no orthography, grammatical or syntax errors.	

CONCLUSION

In conclusion, we argue that WebQuests should become an integral part of any lesson aiming to develop students' critical literacy, initiative, and creativity. The primary reason is that, beyond exposing students to authentic communication contexts and genuine language material (Gkaravelas and Sevi, 2018), WebQuests create a differentiated learning environment. Within this environment, students are encouraged to evaluate, compare, make decisions, and synthesize information—skills that prepare them more effectively to assume the role of active and engaged citizens.

ABSTRACT

Second Chance Schools (SCS) constitute a significant educational institution aimed at adult learners, offering them a renewed opportunity to complete basic education and develop the knowledge and skills necessary for effective integration into the labor market and society. Within this context, an instructional scenario was designed and implemented using the project-based learning (PBL) method. The aim was to foster understanding of the importance of data and its role in informed decision-making.

Learners engaged with a contemporary and practical issue: how to make informed decisions based on data rather than subjective assumptions or misleading information. In an era where information is abundant yet often unreliable, the ability to analyze and interpret data is critical. Participants were trained to utilize tools such as online statistical resources, brainstorming, ChatGPT, SWOT analysis, descriptive statistics, Pareto diagrams, control charts, and Excel to process and evaluate information from various sources. The learning process began with an exploration of the importance of data and the scientific approach to truth-seeking and decision-making. Building on prior instruction in mathematics, computer literacy, and social sciences, learners acquired basic statistical skills and applied analytical practices to everyday situations. They then selected topics of personal or professional interest, collected and organized data, and used the available tools to analyze it. Through this process, they learned to distinguish reliable from unreliable sources, identify patterns and trends, and draw conclusions based on objective evidence.

Participation in the project significantly enhanced learners' self-confidence, as they witnessed firsthand the utility of data analysis and methodical thinking in decision-making. Furthermore, through collaboration and discussion, they developed skills in teamwork, reasoning, and reflective thinking. This pedagogical approach transcended the classroom, equipping learners with the competencies needed to become more active and informed citizens. The results of the implementation demonstrated strong engagement, as learners recognized the value of evidence-based thinking in both professional and personal contexts. This project can serve as a model for instructional practice that promotes critical thinking and scientific reasoning in decision-making, offering a meaningful learning experience tailored to the needs of adult learners.

Keywords: Second Chance Schools, Decision-Making, Instructional Scenario, Project Learning Method, Data.

A HISTORICAL OVERVIEW OF DECISION MAKING FRON ANTIQUITY TO THE PRESENT

The human capacity to make decisions did not suddenly emerge in the era of algorithms. Rather, it constitutes a primordial mechanism that has evolved in parallel with philosophy, science, and democracy. From antiquity to the present day, philosophers, thinkers, and scientists have pondered how correct decisions are made and what processes lead to truth. Plato was among the first to link knowledge with proper choice, which leads to truth and virtue. He believed that the Idea of the Good was the goal of knowledge, and that reason must govern emotions and desires (Goldin, 2020). His famous allegory of the chariot—in which reason reins in the horses of anger and desire—foreshadowed modern dual-process theories of thought: the emotional, fast system and the analytical, slow system of decision-making (Kahneman, 2011). Even at that time, it was clear that the internal conflict between logic and emotion posed a challenge to sound decision-making. The allegory of the cave, with its shadows, illustrates the limitations imposed by human nature and the environment on our pursuit of truth.

Aristotle took a more empirical approach. He introduced logical thinking through syllogisms, laying the groundwork for analytical reasoning (Irwin, 1999). In his Nicomachean Ethics, he developed the concept of phronesis—practical wisdom—as the capacity to choose the mean, that is, the balanced decision that promotes prosperity (Kraut, 2018). For Aristotle, knowledge was not merely theoretical but practical, enabling individuals to learn how to live better.

After the Middle Ages, during the Renaissance, modern philosophy focused on dismantling prejudice and challenging authority. René Descartes proposed methodological skepticism as the foundation of all rational processes. His famous assertion, *cogito ergo sum* ("I think, therefore I am"), placed the individual and their reason at the center of decision-making (Descartes, 1998). He advocated breaking down complex problems into simpler components and solving them gradually—a method still used today in problem-solving strategies. Around the same time, Francis Bacon recognized that the human mind is subject to systematic errors, which he called "idols." These idols—of the tribe, the cave, the marketplace, and the theater—distort thinking and must be eliminated to approach truth (Bacon, 2000). He promoted empirical observation and the inductive method, laying the foundation for scientific methodology and, by extension, evidence-based decision-making (Gaukroger, 2001).

Later, Thomas Hobbes and John Locke situated decision-making within the social and political realm. Hobbes asserted that humans act based on self-interest and survival (Hobbes, 1953), whereas Locke introduced the notion of freedom of choice through the concept of the social contract (Locke, 1821). In the 19th century, Karl Marx added a new dimension to decision-making, emphasizing that human choices are never neutral but are mediated by material conditions and social relations (Marx, 1867). According to Marx, ideological control influences how people think, and therefore, how they decide.

These philosophical traditions—from Cartesian rationalism and Baconian empiricism to Aristotelian ethical praxis and Marxist social critique—form the foundation upon which modern decision-making theories are built. Today, psychology, data science, ethics, and technology converge in a unified effort to understand how we make decisions—and how we might make better ones.

CONTEMPORARY METHODOLOGIES IN DECISION MAKING

Decision-making has evolved into a complex yet fascinating process that integrates science, technology, and human judgment. During the 20th and 21st centuries, it has become a subject of systematic study across multiple scientific fields: mathematics, psychology, computer science, economics, and sociology. All these disciplines converge on a common objective: to assist individuals in making more rational, evidence-based, and effective decisions, minimizing errors and leveraging available data. Statistics was humanity's first "ally" in decision-making under uncertainty. Since the 18th century, with the development of probability theory (Bayes, Laplace, Gauss), mathematical tools such as expected value and utility theory were introduced to guide the selection of optimal alternatives (Von Neumann & Morgenstern, 1944). Classical rational choice theory assumes a "rational" individual who seeks to maximize benefit. However, in the 1950s, Herbert Simon challenged this view and developed the concept of bounded rationality, explaining that humans cannot process all information and often settle for what is "good enough" (Simon, 1957). Later, Daniel Kahneman and Amos Tversky demonstrated that human judgment contains systematic biases—such as overconfidence and anchoring—and that we frequently employ cognitive shortcuts (heuristics) to make decisions (Tversky & Kahneman, 1974). In his influential work *Thinking, Fast and Slow* (2011), Kahneman distinguished between two "thinking systems" of the brain: the fast, emotional System 1 and the slow, analytical System 2, which modern decision methodologies aim to activate.

Data technologies have transformed how decisions are made. Data analytics enables the processing of vast volumes of information—from sales data to demographic profiles. Tools such as confidence intervals, correlation

matrices, and trend forecasting are now used daily in business and public administration (Provost & Fawcett, 2013). Research has shown that organizations embracing a data-driven decision-making (DDDM) culture perform significantly better. Brynjolfsson et al. (2011) found that such organizations are 5–6% more productive than average. However, data alone is not sufficient—interpretation, critical judgment, and the integration of empirical knowledge remains essential. Artificial Intelligence (AI) has introduced a new paradigm. Machine learning algorithms detect patterns in complex data, predict outcomes, and suggest choices—from medical diagnosis to automated investment management (Russell & Norvig, 2020). What matters today is the synergy between humans and machines. Studies such as that of Dietvorst et al. (2015) show that when humans have input in how AI is used, the outcomes improve. In other words, AI does not replace human judgment—it complements it. Humans remain responsible for ethics and final decisions.

Decision engineering has emerged as an interdisciplinary field combining cognitive science, management, and systems design to make decision processes more evidence-based and transparent (Buede & Miller, 2016). Tools such as decision trees, influence diagrams, and criteria matrices help deconstruct complex problems and assess alternative options. Though technical, this approach respects the human dimension—it anticipates teamwork, communication needs, and the avoidance of cognitive traps. No matter how advanced the tools are, they cannot replace critical thinking. Modern citizens must assess complex information, identify biases, and combine data with values. Second Chance Schools (SCS) can offer decision-making education in a grounded, accessible, and practical manner—helping learners recognize when a decision is emotional, when it is evidence-based, and when it is truly sound.

THE FUNCTION AND ROLE OF SECOND CHANCE SCHOOLS (SCS) IN ENCHANCING CRITICAL THINKING AND DECISION-MAKING SKILLS

Second Chance Schools (SCS) in Greece are not merely educational institutions; they are transformative spaces designed to offer adults who did not complete their basic education a renewed opportunity—not only for knowledge acquisition but also for recognition, empowerment, and active participation in society. Established in the late 1990s, SCS have integrated the principles of lifelong learning and social inclusion. Their focus extends beyond academic instruction to the development of personality and self-esteem, fostering learners' ability to think and act autonomously. This is achieved through an innovative, flexible curriculum that emphasizes the practical application of knowledge. The program structure encompasses thematic areas such as "Language and Communication," "Mathematics in Daily Life," and "Information Technology," all of which incorporate principles of experiential and active literacy. However, the distinctive impact of SCS is most evident through Counseling Support and Project-Based Learning. Counseling serves as a catalyst for personal development and goal setting, enhancing the decision-making process. Psychologists collaborate with educators to guide students in evaluating their options and organizing their thoughts. Project-Based Learning, on the other hand, connects knowledge with real-life applications. These projects, whether individual or collaborative and often interdisciplinary, encourage learners to identify problems, collect data, design solutions, and present their findings. This process effectively functions as a laboratory for critical thinking, where learners, through collaboration and problem-solving, learn to weigh alternatives and make informed decisions.

Moreover, SCS education is grounded in adult learning principles, recognizing that learners bring with them a wealth of experiences, knowledge, and perspectives. Through active methods such as discussions, brainstorming, and case studies, adult learners are encouraged to reflect, compare, and reassess their viewpoints. This approach enhances their ability to evaluate information critically and avoid cognitive biases—a fundamental aspect of critical thinking. A significant and innovative element is the use of digital media and multiliteracies, which bolster visual literacy and digital expression. Tools such as images, videos, and presentations empower learners to engage in social issues creatively, making technology a means of amplifying their voices.

The contribution of SCS to enhancing decision-making skills is corroborated by educators' testimonies. In a nationwide study, educators acknowledged the importance of projects, counseling, and re-engagement with learning as critical factors for the social and professional integration of learners. The educational philosophy of SCS aligns with the principles of critical pedagogy, particularly the work of Paulo Freire, who advocated for the development of "critical consciousness" through education. The formation of active, conscious citizens is a fundamental goal of SCS. However, as noted by Katsarou and Tsafos (2009), achieving this goal depends on the commitment and pedagogical approach of each school. The coexistence of individuals of different ages, nationalities, and experiences within the same educational environment creates a unique field of informal learning. Learners develop collaboration skills, respect for diversity, and collective decision-making abilities. These competencies transcend academic learning; they are life skills essential for modern citizens.

TEACHING SENARIO: DATA-DRIVEN DECISION MAKING

To link all the above in practice, we present a specific teaching scenario designed for a Second Chance School (SCS), aiming to cultivate data-driven decision-making skills. It leverages accessible technological tools such as Microsoft Excel, Word, PowerPoint, and ChatGPT. The scenario is built on a "learning by doing" approach, encouraging learners to tackle real-world problems from their personal or professional lives using the tools.

Target Group Adults aged 40+, primary school graduates, employed in positions of responsibility as farmers, livestock breeders, freelancers, and private sector employees.

Objective To enable learners to understand the importance of evidence-based decision making and to practice basic data analysis and decision-making techniques with the support of modern tools.

Lesson Plan Overview (5 sessions of 3 hours each)

Table 1
Lesson 1 Objectives

Lesson Objective	Importance for the Target Group	Sample Assessment Criteria
Understand the difference between logic and emotion in decision making	Adults often rely on instinct or experience. Understanding this distinction helps regulate impulses and foster critical thinking.	Identifies (orally or in writing) one decision made based on emotion and one based on logic. Participates in the discussion “Logic or Emotion?” presenting a viewpoint.
Reflect on past decisions and identify potential biases or thinking errors	Self-observation enables adults to learn from mistakes. Recognizing biases (e.g., confirmation bias) is essential for making responsible choices.	Describes a personal or professional dilemma. Identifies a bias or obstacle that influences the decision. Reflects on what could have been done differently.
Understand what "data-driven decision making" means and identify examples from real life	Most learners in this age group are unfamiliar with data use in decision making. Understanding the concept of "justification" can transform how they think about work, finance, and family.	Explains in their own words what “evidence-based decision” means. Provides at least one example of how data can support a decision (e.g., when to sell crops, which price to set).

Table 2
Lesson 2 Objectives

Lesson Objective	Importance for the Target Group	Sample Assessment Criteria
Learn the basic elements and structure of the SWOT technique	Most adult learners have not encountered strategic tools. Understanding internal vs. external factors is foundational for sound analysis.	Explain what SWOT stands for. Correctly categorizes examples into strengths, weaknesses, opportunities, and threats.
Apply SWOT to a real or hypothetical scenario from professional life	Applying a strategic tool to one's work context (e.g., farming, employee role) shows how analysis can inform everyday decisions.	Completes a SWOT matrix for a personal/professional issue. Justifies at least one item per SWOT quadrant.
Recognize how SWOT supports evidence-based decision making	Visualizing a situation reduces reliance on instinct and encourages structured thinking. This boosts confidence in risk management.	Identifies the most critical SWOT category in their case and explains why. Proposes a decision based on strengths/weaknesses and external factors.

Lesson 1: The Search for Truth and Rational Decision-Making Participants are frequently called upon to make decisions about farming, purchases, investments, hiring, or family budgeting. Realizing that tools such as Excel, ChatGPT, and statistics can support these decisions is a powerful motivator for learning. The first session includes a historical overview of humanity's search for truth (Plato, Aristotle, Descartes, Bacon, Skinner), a distinction between logic and emotion, and a clarification of what "data-driven decision making" means today.

Activities: Discussion: "What is the most difficult professional/personal dilemma you have faced?" Brainstorming: "How do we make decisions? With logic or emotion?" Mini case study: Decision under pressure (e.g., adverse weather for farmers). Tools: Images of philosophers, PowerPoint slides summarizing ideas, guided discussion questions.

Lesson 2: Decision Support Techniques – The SWOT Tool In this session, students learn about the SWOT technique (Strengths – Weaknesses / Opportunities – Threats) with applications from their professional context.

Activities: Example SWOT: "Should I open a new store or not?" Group activity: learners fill out a SWOT analysis for their own business. Tools: Handwritten tables or Excel, ChatGPT for ideas, SWOT diagram design.

Table 3
Lesson 3 Objectives

Lesson Objective	Importance for the Target Group	Sample Assessment Criteria
Become familiar with basic descriptive statistics (percentages, mean, frequency)	Adult learners rarely use statistical terms, yet encounter them daily (prices, expenses, problem frequency). Understanding these supports real-life data analysis.	Can explain terms like "average" or "percentage" in their own words. Calculates values in a simple data table.
Understand the Pareto Principle (80/20) and its practical application	Pareto is a powerful prioritization tool: learners often miss the forest for the trees. Understanding the impact of few causes simplifies decision making.	Identifies most frequent data points and their impact. Interprets a Pareto chart and pinpoints major causes.
Use Excel to visualize data and support decisions	Practicing data entry and visualization in Excel builds confidence and practical work skills. Feeling capable of technology is a key motivational factor.	Build a data table in Excel. Create a Pareto chart with guidance or support.

Table 4
Lesson 4 Objectives

Lesson Objective	**Importance for the Target Group**	**Sample Assessment Criteria**
Understand "monitoring a process" via data recording and analysis	Learners have process experience (e.g., production, budgets) but lack monitoring tools. Learning that decisions require follow-up helps improve outcomes.	Explains what "monitoring a process" means. Gives a personal example (e.g., tracking expenses).
Become familiar with concepts of "normal range" and "intervention thresholds"	Learners often don't know when to worry or act. Understanding control limits helps distinguish normal variation from problems.	Correctly interprets changes inside/outside thresholds. Identifies when a deviation signals concern.
Apply control chart creation in Excel and detect anomalies	Using Excel boosts digital confidence. Visuals enhance critical judgment and help spot when something "goes wrong."	Completes a simple control chart with guidance. Highlights values beyond control limits.

Lesson 3: Introduction to Descriptive Statistics – Pareto Principle This session introduces descriptive statistics, measures of central tendency and dispersion, and their application using ChatGPT and Excel. Visualizations and the Pareto 80/20 rule are presented.

Activities: Excel data entry exercise using professional examples (e.g., causes of delays, customer complaints, types of expenses). Create Pareto chart. Prioritization discussion: "What should I deal with first?" Tools: Excel, ChatGPT for generating examples.

Lesson 4: Control Charts – Monitoring a Process In the fourth session, learners are introduced to the concept of monitoring processes through control charts—a practical tool for both business and household decisions.

Activities: Apply to business or household expense tracking. Create control chart in Excel. Identify anomalies and deviations from target. Tools: Excel, ChatGPT for explanation of terms, examples.

Lesson 5: Project Work – Presentation – Reflection The final session culminates the learning process, offering space for application, presentation, and reflection. Learners work on real or simulated problems from their professional experience and present their solutions using PowerPoint or a diagram.

Table 5
Lesson 5 Objectives

Lesson Objective	Importance for the Target Group	Sample Assessment Criteria
Apply tools and concepts in a real or realistic scenario	Adult learners need to "see the purpose." Applying tools to personal problems helps internalize knowledge.	Uses at least two techniques (e.g., SWOT, Pareto) to analyze a problem. Develop a comprehensive proposal or action plan.
Present their work clearly, orally and with supporting tools (PowerPoint, table, Word)	Presentation builds confidence, improves communication skills, and makes learning visible. Adults "regain their voice."	Organizes a clear presentation with introduction, analysis, and conclusion. Use a tool (slide or document) to support delivery.
Reflect on the process, identifying what was learned and what would be done differently	Reflection is key in adult learning, it boosts self-awareness and knowledge transfer (Mezirow, 2000).	Completes a reflection sheet or responds to questions like "What did I learn?" and "What would I do differently next time?" Expresses personal growth or insight.

Activities: Complete case study: problem analysis, table/chart creation, write a decision proposal. Learners select a realistic problem (e.g., "how to reduce business expenses" or "is it worth entering a new market?") and apply learned tools:

- SWOT analysis to assess the situation
- Pareto to prioritize causes/issues
- Control chart to monitor data trends
- Summarize decision using Word/PowerPoint

Student Presentations – Feedback – Discussion: In small groups or plenary, each learner presents their work. Peers ask questions and provide feedback. The instructor facilitates a positive and constructive experience.

Reflection and Debrief: "What did we learn – Where will I apply this knowledge? – What will I do differently in the future?" Tools: Word/Excel/PowerPoint, reflection sheet, ChatGPT for ideas

CONCLUSIONS AND RECOMMENTATIONS FOR IMPROVEMENT

Teaching data-driven decision-making within the framework of Second Chance Schools (SCS) brings about significant changes in the knowledge, attitudes, and skills of adult learners. Participants become aware of the distinction between instinctive and evidence-based choices and learn to utilize practical tools such as Excel and ChatGPT for information analysis. Thus, decision-making is no longer experienced as an instantaneous act, but as a methodical and reflective process, enhancing their metacognitive abilities (Halpern, 1998). Participation in such activities reinforces learners' sense of self-efficacy (Bandura, 1997) and contributes to cultivating a more responsible, reflective, and active attitude toward both learning and life. Learners enhance their problem-solving, collaboration, and argumentation skills while also developing critical thinking through engagement with authentic, everyday problems (Brookfield, 2012).

Explicit instruction in critical thinking for adults has been shown to be effective, significantly improving related skills, especially when combined with practical application (Abrami et al., 2015). In this context, SCS provides fertile ground where knowledge is directly linked to action, offering experiences that are transferable to family and professional life (Mezirow, 2000). Additionally, programs like this foster a sense of active citizenship. Cultivating the ability to make evidence-based decisions reduces susceptibility to misinformation and fosters a culture of dialogue and truth-seeking—elements that are fundamental to democratic participation (Freire, 1970; Kahneman, 2011). Furthermore, participants are encouraged to pursue continued learning, recognizing knowledge as a tool for autonomy and growth. This enhances lifelong learning and motivates learners to further their education in more specialized fields or vocational training.

To improve future iterations of the program, the following are recommended: the integration of short explanatory videos for key tools such as Excel, ChatGPT, and data visualization, allowing learners to benefit from visual learning and self-paced review. Additionally, the use of scenarios with flawed decision-making processes can enhance learners' reflective capacity and critical analysis skills, by encouraging the identification of errors and the development of alternative strategies. Providing guided worksheets for each stage of decision-making will support the structured documentation, analysis, and presentation of proposals—particularly beneficial for learners with less experience in formal education. Finally, organizing a follow-up review session two months after program completion will reinforce the sustainability of learning. This allows participants to reflect on what they have implemented, observe any changes, and further integrate evidence-based decision-making into their everyday lives. Monitoring and evaluating the impact of these measures through short questionnaires or focus groups can contribute to the ongoing redesign and improvement of the educational process.

INNOVATIVE TEACHING APPROACHES: ENHANCING INDEPENDENT LEARNING THROUGH ARTIFICIAL INTELLIGENCE AND MUSIC

Zoi, Sofia
Electronics Teacher
1st Vocational High School of Ioannina
Ioannina, Greece
email: sofzoi7@sch.gr

ABSTRACT

The experience of teaching fundamental concepts of electrotechnology to high school students has highlighted the significant difficulties faced in understanding electricity related problems. Many students exhibit gaps in prerequisite knowledge, they are unfamiliar with the methodology of Physics and struggle to develop independent learning skills through textbook study. Additionally, phone use for social media, music and games distracts them from the learning process. These observations underline the need for an alternative teaching approach that combines digital technology and the students' interests within the learning process.

Taking above factors into account, a teaching scenario was developed and implemented, leveraging modern artificial intelligence and music tools. The primary objective of this scenario is to encourage students to engage with their textbooks, familiarize themselves with the laws and theories of their study of interest in order to establish a foundation for independent comprehension without the need for auxiliary methods. This approach does not focus solely on understanding physical phenomena but primarily on developing autonomy in studying and the students' ability to seek out and interpret textbook information.

The teaching methodology is based on Lev Vygotsky's theory, which emphasizes the importance of social interaction in learning. The implementation involves the use of the SUNO application, supplemented by the Audacity and Openshot software.

The teacher (or a group of teachers) creates a music piece incorporating lyrics related to science concepts and contemporary sounds without requiring musical knowledge. Students listen to the song and watch the accompanying video. Then, they identify corresponding information in their textbooks and link it to the scientific terminology. Additionally, they complete conceptual charts, which serve as knowledge organization tools. This process evolves into students creating their own music pieces. They are divided into groups and after they study the theoretical terms of a new chapter, they compose their own lyrics and song. This activity aims to primarily strengthen students' ability to comprehend scientific concepts independently as presented in the school textbook and secondarily enhance creativity and collaboration.

This scenario was applied in teaching the units "Basic concepts of direct current" initially, followed by "Electromagnetism" to sophomore students. Findings from the implementation suggest that artificial intelligence and music can serve as learning motivators increasing student engagement and enhancing memory recall of scientific concepts.

This study highlights the importance of utilizing innovative tools in science education and proposes further exploration of similar approaches in the future. It's a dynamic scenario, that with minimal adjustments, can be easily applied on other subjects. Additionally, for younger students, it offers flexibility for an intersectional approach involving subjects such as Literature, Technology, Informatics and Music. The integration of multimedia technologies and creative activities can be an effective strategy to enhance students' learning experience and autonomy in the educational process.

Keywords: innovative teaching approaches, artificial intelligence, music, educational tools, independent learning, learning experience.

INTRODUCTION

Electrical engineering is a scientific field that falls under the broad umbrella of the Physical Sciences. As such, its teaching can be considered to follow similar principles, conclusions, and methods. The need to develop this teaching scenario emerged from insights and observations derived primarily through empirical means, based on many years of classroom experience. The problem it aims to address, which is the contribution of digital media to enhancing the overall quality of learning outcomes is analyzed in the following scenario.

THEORETICAL FRAMEWORK

One of the key skills that learners in the natural sciences are expected to develop is the memorization of general theorems, definitions, and terminology (Liolios, 2019). The use of clear and precise scientific terms serves as a foundation for understanding more complex concepts and for developing advanced reasoning skills (Toraki, Katerina – ELETO). Students must not only comprehend but also memorize definitions and theorems as they are presented in the school textbook. Acquiring these tools enables them to organize their thinking and shape their behavior (Vygotsky, 1997). At the same time, the use of diverse stimuli during instruction not only enhances their existing abilities but also stimulates the internal cognitive processes necessary for their development (Vygotsky, 1997).

According to Vygotsky, it is unrealistic to expect all children of the same age to have mastered the same skills or to be able to achieve the same outcomes independently. Even if they have completed the developmental cycle appropriate for their age, each child possesses a unique capacity to acquire the next set of skills. However, with the support of a teacher or more experienced peers, they can achieve more and develop new skills. Vygotsky defined the distance between what a student can accomplish alone and what they can achieve with guidance as the "Zone of Proximal Development" (ZPD) (Vygotsky, 1997:146–155).

This particular initiative is primarily based on the creation of student work through digital media, which aims to activate their internal cognitive processes and guide them toward self-regulation.

PURPOSE – OBJECTIVES

The purpose of this educational scenario is for students to study their school textbook, become familiar with the laws and theories related to the phenomenon under investigation, and lay the groundwork for independently comprehending these concepts, without relying on auxiliary methods—through the use of a music piece generated by AI.

Intermediate objectives:

- Associate physical quantities with their respective symbols and representations, and connect them with one another (Products: Categories–classes (Kassiotakis & Flouris, 2013)).
- Transform the description of physical quantities from everyday language into the terminology of the scientific field and the specific phenomenon being studied (Contents: Semantic (Kassiotakis & Flouris, 2013)).
- Memorize the physical quantities and the relationships that govern them (Function: memory (Kassiotakis & Flouris, 2013)).

STUDENTS' COGNITIVE LEVEL AND THE NECESSITY OF THE SCENARIO

At the beginning of each school year, a recurring question arises: "What is the cognitive level of the students?" The core subjects forming the foundation for understanding electricity are Mathematics, Physics, and Modern Greek Language.

After investigating, it was found that students' performance in these subjects is generally "good." Naturally, there are always exceptions—students with significantly lower or exceptionally high grades—but these are isolated cases. According to Vygotsky's theory, however, such generalizations are insufficient; deeper exploration is required to fully understand students' capabilities and what they can achieve independently.

Moreover, classroom observation revealed that students do not utilize the textbook effectively to assimilate scientific theorems and terminology. Instead, they rely almost entirely on what they comprehend during the teacher's explanation and on the empirical knowledge they gain through lab activities. While they may understand the phenomena during the lesson, they struggle to recall and apply this knowledge later in exercises or real-life problems.

The conclusion drawn is that a teaching scenario focused on fostering autonomous learning through textbook engagement is essential for students' academic advancement.

PEDAGOGICAL VALUE OF THE "MUSIC PIECE" AND THE VIDEO

Music is an integral part of adolescents' daily lives, as demonstrated by the nationwide study conducted by Kokkevi, Fotiou, Xanthaki, and Kanavou (2010). A significant portion of their free time is spent listening to music (Kokkevi et al., 2010:2), highlighting their deep connection to this form of art. Given this reality, it is reasonable to assume that a song aligned with their musical preferences may exert greater influence and be far more engaging than the one-dimensional and often impersonal language of traditional teaching. Music serves as a powerful means of expression and communication, offering students a familiar and meaningful way to assimilate knowledge and values. Through this art piece they can also acquire the necessary "signs" and "tools" (as defined by Vygotsky, 1997) for mastering scientific semiotics.

The widespread use of smartphones further facilitates this process, allowing teens to listen to music almost anywhere. Thus, even when they need to recall a scientific theory, they can access an educational audio resource—using technology as a learning tool.

At the same time, imagery plays a complementary and crucial role alongside sound, a concept widely supported by the literature. According to neuroscience, about half of the neurons in the human brain are involved in visual processing, making visualization a powerful tool for cognitive activation (Pang, 1995, as cited in Mikropoulos, 2002).

In this scenario, the proposed activities are built around contemporary cultural stimuli—specifically, elements of youth-generated culture. The teacher explores students' preferences, identifying popular music genres and songs by asking them to suggest representative examples. Concurrently, the teacher investigates the slang and idiomatic expressions commonly used by students. Using these cultural "tools," the teacher creates a song and accompanying music video that serve as the "artificial stimulus" (Vygotsky, 1997), which will act as the trigger for learning progress.

Consequently, sound, lyrics, and video work together synergistically in the memorization of scientific symbols. When students later revisit the textbook, they are more likely to feel familiar with the content—rather than viewing formulas as obscure, foreign symbols.

THE SUNO WEB APPLICATION

SUNO is an online Artificial Intelligence tool designed for song generation and composition. Its interface is user-friendly: the user inputs lyrics into a designated field, selects a preferred music genre, and the application transforms the text into a song. For each "create" command, SUNO produces two different song versions, allowing the user to choose the one that best fits their needs. This process can be repeated up to ten times in the free version.

In this context, SUNO is an innovative tool that allows educators to generate musical content for instructional purposes quickly and easily. It requires no prior musical training, making it accessible to all teachers, regardless of their background in music. By leveraging AI, traditional teaching instruction can be enriched—or even replaced—by a more engaging, interactive, and experiential form of knowledge transmission that aligns with students' interests and learning styles.

For students, using SUNO becomes part of a learning process that closely resembles recreational play, thereby making education more attractive and experiential. Learning occurs through active engagement with the environment and the use of appropriate tools. SUNO acts as a mediating instrument, enabling students to interact with knowledge in a natural and effortless way. As a result, they remain continuously connected to the textbook content and scientific terminology, embedding information within a context that feels both familiar and appealing.

"AUDACITY" AND "OPENSHOT"

These two software programs are used to create the music video that accompanies the song. Both are freely available online and relatively easy to use, sharing a similar editing philosophy:

- "Audacity" is used for audio editing. In the context of this scenario, it is primarily used for mixing different musical elements and ensuring smooth transitions between segments (e.g., fade-in, fade-out).

- "OpenShot" is used for video editing. It allows for the precise placement of images to synchronize with the lyrics and visuals. Transitions between images are managed using various filters to ensure fluid continuity.

THE ROLE OF THE TEACHER AND STUDENTS

The teacher's role unfolds along three main dimensions: guiding, monitoring, and collaborating with students. As the most experienced figure in the learning environment, the teacher serves as a role model. As Vygotsky (1997) states, "what children cannot do today, they can do tomorrow with the help of a more experienced adult." The teacher's role gradually evolves from directive to guiding, involving observation and orchestration of the learning process.

The teacher begins by exploring students' linguistic codes and musical preferences. Based on these findings, a song is created, ensuring adherence to educational standards and appropriateness.

In the second part of the scenario, students work in groups of mixed abilities to foster collaborative interaction. No specific roles are assigned within the groups; instead, students work together step-by-step, participating equally in all decisions.

THE SCENARIO

Duration of the Scenario: 4 teaching hours.-
Part 1: Synchronous session
Part 2: Combination of synchronous and asynchronous sessions
Location: Computer lab.
Digital Materials:

- Software: SUNO, Audacity, OpenShot, Word, media players.
- Hardware: School lab computers, speakers, projectors or large screens, students' personal devices

PREPARATION: SONG & VIDEO PRODUCTION

The music piece and video are created according to the following guidelines:

1. Select the topic (e.g., Chapter 2: Electricity).
2. Begin with a strong introduction referring to the main theme.
3. Choose a music style and vocal tone that emotionally resonates with students (Parlambas, 2013).
4. Use contemporary idioms and slang (e.g., "slay," "φλεξάρω") for relatability.
5. Avoid exaggeration to prevent ridicule or disengagement.
6. Ensure the lyrics follow the scientific logic and sequence of the textbook.

TYPED FORMS AND ASSESSMENT SHEETS

Students will be given a typology table to complete during the activities. The reference sheet includes closed-ended questions to assess independent recall and understanding of symbols and concepts.

Assessment Sheet 1: Given after activities. It includes fill-in-the-blank, table completion, and theorem combination problems. Students can use textbooks while the teacher observes.

Assessment Sheet 2: Given in the next session. Students complete it with books closed to measure long-term retention.

BEGINNING OF ACTIVITIES

First Part:

A) Distribute reference sheet.
B) Show video clip. Replay if needed and discuss.
C) Encourage frame-by-frame analysis with open textbooks.
D) For each concept: "Show screenshots - Reference textbook pages - Ask guiding questions - Fill in typology table."

For example: The students listen to a song that sounds similar to "Trap" music and its characteristics and the lyrics are about Ohm's law. At the same time the students have the opportunity to the following Figure with the same

reference. After this, they read from their book the scientific rendering of the Ohm's law. Last but not least, they write the type on their typology table.

Figure 2
Snapshot from the video referring to Ohm's law

E) Student autonomy is increased by gradually removing direct page references.
F) Introduce critical thinking exercises. Pose open-ended questions (e.g., “What does power represent?”).
G) Evaluate using assessment sheets.

Second Part
Teacher acts as facilitator and prepares textbook materials. Worksheet includes:

- Reading textbook excerpts
- Writing original lyrics
- Selecting music styles
- Using SUNO

Teacher reviews lyrics for scientific and linguistic accuracy.

Two assessments:
1. Solve textbook exercises using excerpts (including topics not in the song).
2. Closed-book sheet with fill-in-the-blank and formula/unit table.

OBSERVATIONS – RESULTS

The scenario was tested in a real classroom. Students fell into four categories:

- ✓ No effort
- ✓ Random answers
- ✓ Tried with moderate success
- ✓ Fully met expectations

Initially, students were curious about the song's popularity. They engaged more on second listening, especially due to slang use. Many opened their books to follow Ohm’s Law and completed tables with guidance.

Over time, more students attempted the exercises. The main obstacle was mathematical background. In part two, they hesitated at first to compose lyrics, eventually copying textbook content into SUNO. Chosen music genres varied widely.

When solving exercises, students showed relief when allowed to use textbooks, indicating both their dependence and increasing comfort with using them. About 50% accuracy in terminology recall was observed. Formula table completion had nearly perfect results.

CONCLUSIONS

Considering students’ initial levels, progress was universal. Achieved intermediate goals:

- All improved in identifying symbols and representations.
- Most used scientific terminology correctly.
- Nearly all memorized physical quantities and their relationships.
- All used the textbook as a resource when needed.

Although not all students comprehended material at the same depth, the foundation for autonomous learning was established.

SUGGESTIONS FOR EXTENSION – CONCLUSION

This scenario represents a flexible and dynamic teaching method applicable to all subject areas with minimal modifications. It can be used in middle and primary school as well.

For younger students, the scenario can be enriched through interdisciplinary collaboration with language, technology, and music specialists.

One major advantage is that no prior musical expertise is needed, making the method accessible to all educators.

ABSTRACT

This case study was conducted within the framework of the Research Project course of the first grade curriculum at the Evening Vocational High School of Preveza and addresses the use of art combined with digital media in the educational learning process. Students' engagement with art began with an introduction to world-famous painters through digital presentations and videos. Then, students recreated characteristic works of these artists as murals on a classroom's blank walls, which were previously undecorated. The reproduction of the artworks on the walls utilized a projection screen, computer, and digital applications for image editing. The activity mainly involved adult students, who constitute the majority of the school's population.

The aesthetic experience is particularly interesting, as it represents an innovative educational method that can contribute to Transformative Learning and has been applied not only in adult education but across all educational levels in recent years.

Observing a work of art during an educational process stimulates impulses and activates the learners' critical thinking. For this reason, the purpose of this action was to evaluate the implementation of learning through art, the aesthetic transformation of a school classroom with artworks, and the familiarization with basic digital tools. Aiming to highlight an alternative teaching method for adult students at the Evening Vocational High School, the study investigated students' attitudes during the activity and the contribution of art to their active participation, enhancement of critical thinking, and the potential redefinition of stereotypical views and assumptions.

The goal was to explore the extent to which learners utilize all their senses, use their imagination, draw on existing knowledge and experiences, and develop the ability to think critically during the educational intervention through the use of artworks combined with basic digital media.

Thirteen students aged between 18 and 61 participated, and observation was chosen as the methodological tool, providing an opportunity to collect data emerging from real situations through learners' statements, gaining more personal information.

The educational intervention contributed both to learners' familiarization with art and digital media. Additionally, it fostered collaboration and exchange of personal experiences. Participants managed to process their prior perceptions, think critically about them, and in some cases revise them, developing reflective dialogue. The involvement of emotions and the liberation of thought and expression led to a change in attitude towards this novel learning experience, initially met with reservation but gradually with pleasure and enthusiasm. The positive impressions gained and new knowledge acquired motivated further engagement with art, which contributes to the ability to perceive things from different perspectives and the possible redefinition of assumptions.

Keywords: Adult Education, Transformative Learning, Art, Digital Media, Critical Thinking.

EFFECTIVE LEARNING AND ADULT LEARNERS

There are different interpretations regarding the definition of adulthood. By the term "adult," we refer to socially recognized adults who have completed their studies, work, are autonomous, and independent in decision-making (Balboni, 1994). According to Rogers (1999), the learning process requires the active participation of learners. Effective learning in adults is achieved when education is directly related to their daily lives, when they act and engage, and when they feel integrated into a group within a climate that encourages participation (Courau, 2000). Adult learners are characterized by five distinct features related to the goals they set, their life experiences, their preferences regarding learning methods, their desire for active participation in the learning process, and the way they face obstacles to ensure learning effectiveness (Kokkos, 2005a).

CRITICAL REFLECTION IN ADULT EDUCATION

Many definitions of critical thinking have been proposed, and there is no single universally accepted one. According to Dewey (cited in Zarifis, 2009, p.50), "reflection as a concept concerns solving a confusing or problematic situation". Critical thinking is a mental and emotional process through which individuals process data based on logic and, unaffected by prejudices, manage to reach sound conclusions and select appropriate courses of action (Matsaggouras, 1999).

John Dewey, one of the first educational theorists to use reflection, places particular emphasis on experiences, each of which contributes to preparing a person to acquire new experiences, leading to their development and adjustment (Dewey, 1980). Paulo Freire was the founder of a humanistic theoretical approach and educational practice focused on developing critical consciousness with the goal of achieving social change (Kokkos, 2005a). For Freire, the educational process is a cultural action that shows the path to freedom through the power of knowledge, which is transformed into action. Through awareness of their situations and the reasons for their formation, individuals seek appropriate ways to overcome them (Vasilou-Papageorgiou, 2004).

JACKMEZIROW'S TRANSFORMATIVE LEARNING

One of the theorists who laid the foundation for critical theory in adult education is Jack Mezirow, who developed the theory of Transformative Learning, building on the ideas of Dewey and Freire (Mezirow, 1991). For Mezirow (2007, 2009), learning is not merely acquiring new knowledge, but is achieved through critical reflection on personal assumptions and mental habits in which the individual is trapped within the broader social system. Learning, according to Mezirow, begins in childhood, where it is formative, and continues into adulthood, where it becomes transformative (Koulaouzidis, 2008). Each person perceives reality based on perceptions that shape their personality (Kokkos, 2005c).

Transformative Learning is the process by which a problematic frame of reference is identified with the purpose of revising erroneous perceptions created by external factors and society (Kokkos, 2005a). Achieving this goal requires critical reflection, through which mental habits are revised and action is taken aimed at change (Mezirow, 2009). The completion of the Transformative Learning theory involves ten different phases, which are not strictly followed in every case but have been formulated according to the theory's practical application (Lintzeris, 2007). "The theory of Transformative Learning constitutes the most structured, scientifically substantiated, and particularly timely approach in adult education" (Kokkos, 2010, p. 76).

THE CONTRIBUTION OF ART IN ADULT EDUCATION

The concept of art has been defined in various ways. According to Davis (cited in Kokkos, 2011b), art includes all works that express the experiences and views of artists about the world and life. Small (1983) considers it a way to explore the internal and external environment, while Gombrich (1994) states that a work of art represents reality as perceived by the artist. The timelessness and emotions evoked by art give it special value, as it cultivates divergent thinking and triggers diverse reactions. Moreover, art is considered a universal language that connects cultures and people (Zdanski, 2011). In education, art is used as a tool to achieve pedagogical goals and develop cognitive skills, while images and colors give observers the opportunity to express their feelings (Kanellopoulos & Tsaptaridis, 2010). Through systematic observation of artworks, reflection and imagination are developed, which strengthen critical and creative thinking (Kokkos, 2011b; Mega, 2011c). Understanding is achieved through dialogue, while the aesthetic experience improves communication and promotes collaboration (Shor, 1992; Tsaptaridis, 2011). A work of art functions as a code of communication that sparks interest and strengthens dialogue and mutual respect (Kokkos & Mega, 2007; Clover, 2006). According to Dewey (1980), the observation of artworks stimulates imagination, which is a fundamental part of the learning process and develops through aesthetic experience (Kokkos, 2011b). In Freire's educational method, processing

codifications—often artworks connected with learners' experiences—promotes critical consciousness (Freire, 1978; Manthou, 2007). Finally, Kastoriadis (2008) refers to the "Abyss" of every society as the space of hidden desires and perceptions, often concealed, while important works of art and literature express the invisible and create new elements of social existence (Kokkos, 2011b).

PERKINS' MODEL FOR ART OBSERVATION

For the processing of artworks, Perkins (1994) proposes an approach developed in four successive phases of observation aimed at activating learners' critical thinking. In the first phase, participants are given time to observe the artwork gradually and silently, so they can focus their attention on visual elements without immediate interventions or prejudices (Perkins, 1994). In the second phase, known as the broad observation phase, observers are encouraged to approach the work based on logic, avoiding premature conclusions, which enhances creative thinking and openness to the polysemy of artworks (Kokkos, 2011b). The third phase concerns in-depth analytical observation, where learners examine the work more closely, searching for symbols, techniques, and compositions that reveal the content and possible intentions of the creator (Perkins, 1994). Finally, in the fourth phase, participants, having acquired a comprehensive view of the artwork, are invited to formulate their own interpretation and highlight the messages emerging from their personal and experiential approach (Perkins, 1994). Perkins refers to this approach sometimes as a strategy and sometimes as a process, without labeling it explicitly as a model (Kokkos, 2011b).

TRANSFORMATIVE LEARNING THROUGH AESTHETIC EXPERIENCE ACTION PLANNING

The idea to carry out the present action arose during the research project, which is one of the courses in the first grade of the Evening Vocational High School of Preveza. The effort to interpret images and shapes activates participation and promotes teamwork, dialogue, and exchange of opinions with others (Polemí-Todoulou, 2007). Considering that observing a work of art stimulates and activates the learners' critical thinking, the proposal was made to the first-grade students, aged 17 to 61, to engage with art combined with digital media as part of the research project course.

The criterion for choosing this particular topic was the interest presented by using art as an innovative method in the educational process and the way it can be utilized through digital media. Transformative Learning through Aesthetic Experience has increasingly been applied in research across all educational levels in recent years. This fact motivated the choice of this specific action to determine whether this educational intervention could enhance student participation.

The main goal was the aesthetic transformation of a classroom with murals and the evaluation of the learning method applied through art and the use of digital media. Observing the participants' attitudes during the implementation of the action aims to draw conclusions regarding their active participation, enhancement of critical thinking, and possible transformation of their perceptions. Observation is a data collection tool suitable for any kind of methodological approach (Vamvoukas, 2010). Through observation, there is the opportunity to collect data arising from real situations, allowing the researcher-observer to follow the learners' spoken words, collect them verbatim, and obtain more personal information (Cohen et al., 2008).

The goal of the action is to investigate the extent to which learners use all their senses, employ their imagination, recall existing knowledge and experiences, and develop the ability to think critically during the educational intervention. Specifically, the action aims to explore the contribution of art to cultivating critical thinking, recognizing the value of art in education, and familiarizing learners with basic digital tools. The teaching activity was designed to develop communication skills through art, as learners often feel uneasy when asked to use digital tools to understand and interpret artworks, activating their imagination and senses.

From the first lessons, it was observed that students had certain perceptions about the benefits they gain from school. Due to current demands, where professional employment is linked to certification of increasingly more qualifications, a one-dimensional view prevails that a high school diploma serves only as a formal qualification. Through discussions, it was revealed that learners saw learning more superficially rather than substantially. When the proposal was made to the students to paint murals using basic digital tools, there was a perception that painting is for small children and that their age and professional and family responsibilities do not particularly support participation in the project.

Given these conditions, the intention arose to encourage them to think critically and process their views on art and the use of digital tools, aiming to create deeper motivation for engaging with new challenges. When the idea was to examine their opinions by observing some artworks and selecting some to decorate a "blank" classroom, hesitation

appeared due to unfamiliarity with the subject. Although their initial reaction was not very favorable, they eventually agreed to carry out the process. After a presentation of artworks by different painters, it was jointly decided with the students to work on the art of the Spanish painter Joan Miró.

The selection of appropriate artworks aims to awaken learners' interest in art. The process and method of the lesson depend on the proper choice of artworks, which must be made with correct planning and study (Macaire & Hosch, 1996).

The selection of artworks was based on criteria that enhance the learning process. High-quality works were preferred to maintain learners' interest and strengthen their desire for deeper engagement (Macaire & Hosch, 1996). The aesthetics of the works were considered important for evoking emotions and connecting with learners (Macaire & Hosch, 1996). The content was also examined in terms of its ability to provoke critical thinking and emotional involvement (Kokkos, 2011b), and works with strange or unfamiliar elements were chosen to enhance curiosity and imagination (Brandi, Dommel & Helmling, 1988). Finally, the possibility of linking to learners' existing knowledge and the multidimensional reading of images was taken into account (Macaire & Hosch, 1996; Brandi, Dommel & Helmling, 1988).

In the first phase of the activity, learners were given time to gradually and carefully observe each artwork, answering the question: "What do you observe?" Their responses highlighted elements such as strange figures, stars with unusual shapes, eyes of various sizes, geometric shapes, uneven circles, and the presence of animals and birds.

In the second phase of broad observation, students were asked to identify elements in the works, express their impressions, wonder about the symbols, and share their feelings. They noted the presence of star-like symbols, that the symbols resembled children's drawings, bright colors improved their mood, even the eyes had unnaturally vivid colors, and they noticed many irregular lines and shapes.

In the third phase of detailed observation, after receiving information about the artist, learners tried to analyze the work and express their opinions. The works evoked feelings such as curiosity about what lies behind the image, concern about the artist's message, admiration, the need to understand the painter's thinking, puzzlement, liveliness, optimism, a sense of freedom, euphoria, hope, a tendency to daydream, and reminiscence of childhood. They also identified elements that give strength to the works, such as the formation of bodies without faces, the intense eyes of various sizes and shapes, the irregular circles, the harmonious combination of colors, and the star-like shapes.

In the fourth and final phase of Perkins' technique, learners re-examined the works as a whole and answered the question of what connects them. They recognized common symbols, intense colors, a sense of childlikeness and innocence, distorted figures, and strange geometric constructions. Simplicity and austerity were emphasized, with colors such as blue, red, yellow, green, and black standing out. The works resembled children's drawings, included many objects floating irregularly in space, elements of nature, and emphasized eyes. Finally, the students felt that the works "speak," although it is not always clear exactly what they want to say.

With the completion of the four phases of observation, it appeared that students focused on key elements, gradually all participated, and positive emotions prevailed. Notable was everyone's effort to convey some message and express admiration and curiosity. At the same time, the intense colors caused positive impressions and feelings of calm and serenity. Most agreed that learning the style of a painter reveals interesting elements of artistic culture and showed interest in searching online for more details about Joan Miró's life and works.

The action began with the gradual design of each artwork on the wall using a projector for projection and then painting, mixing colors to achieve the desired shade according to the model. Upon completing the first mural, satisfaction with the process and excellent collaboration among students was observed, who expressed opinions and ideas and were enthusiastic about their participation and the result. This gave them motivation to continue with greater zeal and determination with the remaining works, paying attention to details and trying to perfect them. Gradually, they improved in using the projector and painting technique, shared personal experiences, and discovered capabilities they did not believe they had. A notable case was a student who expressed the desire to create his own works, considering that through the action a talent he had never utilized came to the surface. For some, painting proved to be a pleasant means of expression, for others a way to escape daily life, and for others a way to contribute in any way possible, enhancing teamwork and mutual assistance. Necessary interventions were made in the classroom to better highlight the works, and the final result fully satisfied the students, boosting their self-esteem and pride.

THE USE OF DIGITAL MEDIA IN ADULT EDUCATION THROUGH ART

During the implementation of the educational program, various digital media were utilized, significantly contributing to the enhancement of participation, creativity, and critical thinking among the learners. The connection of art with technology proved particularly effective in activating the participants and facilitating transformative learning.

Specifically, applications such as PowerPoint and Canva were used to present artistic works, aiming to visualize concepts and create an emotional connection with the content. At the same time, through the Google Arts & Culture platform, learners took virtual tours of museums and galleries, which broadened their aesthetic experience and provided stimuli for reflection.

Learners were invited to create their own artworks using digital tools, while with applications like Moovly and Powtoon they presented personal narratives and reflective statements in the form of short videos. This enhanced personal expression and allowed the connection of personal experience with the educational process.

The use of interactive tools such as Padlet and Miro facilitated collaboration and the exchange of ideas. Participants worked on digital canvases, commented on each other's creations, and developed a sense of collectivity and active participation. Additionally, digital portfolios were created in which learners recorded their progress, thus reinforcing the process of reflection.

The experience showed that digital media did not simply function as auxiliary tools but became an essential part of the learning experience. They contributed to the development of creative thinking, self-expression, and active participation, promoting a pedagogical approach that connects technology, art, and adult education in a experiential and transformative way.

CONCLUSIONS

Overall, the data gathered from observation showed that the learners participated with interest in the educational process and used digital tools comfortably. The creation of a positive atmosphere and encouraging comments helped even the more hesitant individuals to adapt and increase their enthusiasm for something new they gradually discovered.

Although most initially reacted negatively to the implementation of the method, their activation and participation in the discussion gradually increased, expressing their opinions in response to questions posed. All learners shared their personal views, and their participation grew as the dialogue became more meaningful and the process advanced. Equal participation time and respect for others' opinions contribute to the development of reflective dialogue (Mezirow, 1991).

Regarding the use of imagination during the observation of artworks, it was noted that learners listened attentively to the questions and used their imagination to provide answers. Their imagination evolved from one observation phase to the next, especially when they tried to connect the symbols they identified with the messages the paintings might conceal. The more they focused on the subject of each work, the more they attempted to transport themselves imaginatively to the space and time related to it—a process confirmed by Perkins (1994).

Concerning the emotions that arose, many shifts were observed from the beginning to the end of the process. In all works, feelings of curiosity, surprise, admiration, and reflection were characteristic. This confirms Dirkx's (2004) finding that learners experience unprecedented emotions when deeply observing and attempting to analyze a work of art. The approach to the artworks was made through discussion and dialogue, generating feelings of pleasure and satisfaction. As Shor (1992) points out, dialogue not only helps in understanding a subject but also promotes creative learning combined with entertainment.

Regarding learners' views on art and digital tools before the method's application and those formed upon its completion, noticeable differences emerged. Initially, most participants approached the process with caution and hesitation, seeing it as something new and unfamiliar. According to Raikou (2013), this is a common reaction due to unfamiliarity with such methods and fear of difficulty. In isolated cases, indifference and reluctance were noted, considering it a waste of time to engage in something unnecessary and outside the usual curriculum. However, there was also a case of a learner who enthusiastically accepted participating in an original process different from previous experiences and even encouraged others to try it.

By the end of the process, learners managed to form a new perspective on art. Comparing it to their initial views, it became apparent that approaching things from different viewpoints changes the way they perceive them. This observation is supported by Dewey's (1980) view that contact with art enhances the ability to perceive things differently. The redefinition of learners' opinions and their willingness to reconsider their perceptions in general demonstrates that art is an appropriate medium for transformation, as also argued by Mezirow (2007).

In conclusion, the acquisition of positive impressions and new knowledge provided the learners with new motivation to engage with art and digital tools. They were led to critical reflection, reexamining their entrenched beliefs and revising the idea that painting is only for children and not suitable for their age.

The involvement of emotions and the liberation of thought and expression led to a change in attitude towards a learning experience through art, which was initially met with reservations but eventually with pleasure and enthusiasm. The gradual transformation of the classroom into a pleasant space led to a change in their willingness to remain there, and satisfaction with the results boosted self-esteem and mutual respect.

ABSTRACT

This research paper examines the use of podcasts as a modern educational tool in the teaching of literature courses. The aim of the study is to investigate the pedagogical value of podcasts, to understand how they shape the learning experience of students, as well as to evaluate their effectiveness in improving understanding and critical approach to literature, language and history. The methodology of this specific research is based on qualitative methods, including semi-structured interviews with philologists and secondary school students, as well as content analysis of selected educational podcasts. Particular emphasis is placed on evaluating interactivity, narrative approach and the degree of student engagement in the learning process through the audio experience. At the same time, factors that influence the acceptance of podcasts as a learning medium are explored, such as thematic content, quality of production, linguistic adaptation and relevance to school curricula. The findings of the research reveal that the use of podcasts in teaching can offer multiple benefits. Specifically, it enhances learning flexibility, allowing students to acquire knowledge at any time and from any environment. In addition, the narrative format and the use of audio create a more vivid and enriched learning experience, which can increase students' attention, concentration and engagement. However, challenges are also recorded, such as the absence of visual stimuli, which are critical for some teaching units, as well as the need for carefully selected and quality-controlled content. In conclusion, the research highlights the potential of podcasts as a complementary teaching tool for literature courses, highlighting the need for their integration into organized educational strategies. The creation of specialized educational content, adapted to the needs of students, is proposed, as well as the training of teachers in their effective use. With appropriate pedagogical guidance, podcasts can contribute substantially to the cultivation of critical thinking, creativity and active participation of students in the learning process

Keywords: podcasts, literature education, philology, multimodal learning, qualitative research, student engagement

INTRODUCTION

The evolution of technology and digital media has brought significant changes to the way the educational process is organized and implemented. The integration of Information and Communication Technologies (ICT) into education has opened new horizons in learning, offering opportunities for flexibility, personalization, and enhancement of students' initiative. Within this context, podcasts are emerging as an innovative tool with a dynamic role in shaping modern learning experiences. The use of podcasts in education combines the ease of listening with the power of storytelling, enabling students to actively engage, develop listening skills, oral expression, and critical thinking, while also supporting multimodal learning. Although podcasts are often associated with entertainment or news, they acquire important pedagogical dimensions when used for educational purposes.

CONCEPTUAL DEFINITION

The term podcast is a combination of the words iPod (Apple's audio playback device) and broadcast (radio transmission). It refers to recorded shows or audio files that can be downloaded or streamed online and played at any time by the user. In the educational context, podcasts are defined as "digital recordings created with the aim of supporting learning and distributed via the internet" (Hew, 2009). They are asynchronous learning tools that allow students to interact with the content at their own time and pace. Podcasts are an authentic listening resource, offering users the opportunity to benefit from them individually (Fernando, 2015). Moreover, they combine the power of spoken language with the convenience of auditory access and listening anytime, anywhere. Modern platforms such as Spotify host thousands of podcasts on a wide range of topics.

THEORETICAL FRAMEWORK

The pedagogical utilization of podcasts can be interpreted through various learning theories. Their integration into education aligns with broader frameworks such as social constructivism and engaged learning. According to Vygotsky (1978), learning is an active process of acquiring knowledge, which is enhanced through initiative, reflective listening, and multimodal understanding. Podcasts, as a form of spoken discourse, provide an authentic communicative context that supports collaborative and dialogical learning.Additionally, the multiliteracies theory (New London Group, 1996) highlights the need to develop skills for understanding and producing messages across multiple forms and media. Podcasts respond directly to this challenge by combining speech, sound, music, and storytelling techniques, thus promoting multimodal literacy.

The differentiated instruction approach (Tomlinson, 2001) also recognizes students' diverse learning needs and paces. The flexibility of listening to podcasts at different times and speeds offers a personalized learning experience. According to social learning theory (Bandura, 1986), both creating and listening to podcasts enhance learning through observation, identification, and social interaction. Furthermore, based on multimodal learning theory (Mayer, 2009), podcasts support learning through multiple stimuli (sound, emotion, rhythm). Podcasts foster learning autonomy (Lee, McLoughlin & Chan, 2008), and encourage collaborative learning when students are involved in producing their own audio narratives or participate as critical listeners of podcast content.

LITERATURE REVIEW

Podcasts represent a modern medium of communication and education that utilizes auditory information to transmit knowledge and skills. As a form of audio content that can be played anytime and anywhere, they offer significant advantages over traditional teaching methods (McGarr, 2009). The international literature has highlighted the multiple benefits of using podcasts in education:

- They enhance comprehension and information retention: Students can listen to the content repeatedly, which facilitates deeper processing and understanding (Fernandez, Simo & Sallan, 2009).
- They support the connection between prior knowledge and new information (Popova et al., 2014).
- They improve concentration, active participation, and student engagement (FeHennig, 2017).
- They promote active learning: Student-created podcasts enhance metacognitive skills, critical thinking, and creativity (Kay, 2012).
- They adapt to different learning styles, offering accessibility, flexibility, and variety in teaching methods. Auditory learners or students with learning difficulties benefit especially from audio-based content (Evans, 2008).
- They increase motivation and involvement: Podcasts are perceived as appealing and widely accepted by students (McKinney, Dyck & Luber, 2009).

- By offering an authentic learning context, they foster empathy—especially when the podcast content is based on personal experiences or social issues (Nikolaidou, 2021).
- They cultivate verbal expression and oral skills (Fernando & Marikar, 2017).

EDUCATIONAL APPLICATIONS

In the Greek educational context, the use of podcasts is still at an early but promising stage. Especially during the period of remote learning due to the COVID-19 pandemic, the importance of asynchronous learning tools, including podcasts, came to the forefront. Primary and secondary school teachers began experimenting with the creation of audio narratives, teaching episodes, or interviews as part of cross-curricular approaches. In addition, the Digital School by the Institute of Educational Policy (IEP) has integrated podcasts into its digital repositories to enrich teaching, while educational radio platforms such as the European School Radio offer opportunities for school units to create and broadcast their own podcasts, promoting creativity, collaboration, and multimodal expression (Pantelidou, 2021).

Furthermore, within the framework of skills workshops and project-based programs, podcast creation can be linked to the enhancement of creativity and critical thinking, the cultivation of digital literacy skills, the development of collaboration and communication abilities, and the promotion of student initiative. Douvlis (2022) notes that primary school students who engaged in podcast creation showed increased interest in both written and oral expression. Especially in multicultural classrooms or environments with students from diverse linguistic backgrounds, podcasts can act as bridges of inclusion, providing an alternative and more accessible means of expression.

Particularly in filological subjects such as Literature, Language, History, and Ancient Greek, podcasts offer a unique opportunity to utilize storytelling as a tool for deeper engagement with content. The narrative form of podcasts facilitates both the transmission of abstract or complex ideas and the emotional connection to the topic, aiding in better understanding and retention (Robin, 2008). Through audio narrations of literary works, dramatizations of historical events, or listening-based language games, students become actively involved in a learning experience that blends knowledge, imagination, and creativity. Specifically, podcasts can be used for literary analysis, discussions of historical events, language exercises, oral speech production, and the development of argumentation.

However, integrating them into teaching practice requires the appropriate teacher training, adequate technical infrastructure, and careful selection of topics and language style, tailored to the students' age and learning needs (Salmon & Edirisingha, 2008). When these conditions are met, podcasts can become a valuable tool for enhancing multiliteracy and creative expression in the modern classroom.

RESEARCH

The use of podcasts in the educational process has attracted considerable attention in educational research over the past decade, mainly due to their ability to offer a more personalized and flexible learning environment (Rosell-Aguilar, 2015). In the context of teaching literature-related subjects, this study aims to investigate the effectiveness of podcasts as a tool for understanding, reflection, and critical engagement with knowledge, focusing on the perspectives of both teachers and students.

The central research questions were:

- Does the use of podcasts contribute to a deeper understanding of the content in literature-related subjects (such as Literature, Language, History)?
- How does the audio experience affect students' motivation, concentration, and active participation?
- What are the perceived benefits and difficulties of integrating podcasts into teaching?

The specific research objectives were to:

- Investigate the effectiveness of podcasts in enhancing learning and critical thinking among students.
- Evaluate their contribution specifically to the understanding of literature, language, and history.
- Analyze student engagement in the learning process through the audio experience.
- Compare traditional and digital methods of learning.

The research approach draws on the theoretical foundations of sociocultural learning as proposed by Vygotsky (1978), according to which learning is enhanced through tools provided by the cultural environment—in this case, the audio medium of the podcast. It also incorporates elements from blended learning and self-regulated learning theories (Zimmerman, 2002), since podcasts provide asynchronous access that promotes autonomy and learner control. This research aspires to contribute to existing literature by expanding knowledge about the application of podcasts in

humanities education, a field that has so far been primarily explored in relation to science or language instruction (Fernandez, Simo & Sallan, 2009).

METHODOLOGY

The methodological approach of this research is qualitative, as the aim is not quantitative measurement but an in-depth understanding of the experiences, attitudes, and perceptions of the participants (Creswell & Poth, 2018). Three research techniques were applied to collect data, ensuring the completeness and reliability of the findings through triangulation:

- Semi-structured interviews with 10 philology teachers who have integrated podcasts into their classrooms. The interview guide included questions about the context of use, student and teacher reactions, the advantages of using podcasts in their teaching, and the challenges they encountered.
- Focus group discussions with 30 students who had experience listening to or producing educational podcasts. Students shared their opinions and preferences, whether they felt they benefited, and offered suggestions for improving the medium.
- Educational material analysis: Existing podcasts used or created in literature-related courses were examined. Evaluation was based on pedagogical criteria (e.g., clarity, language appropriateness, cognitive objectives).

The sampling was purposive, focusing on individuals with relevant experience on the topic (Patton, 2015). Data analysis was based on the thematic analysis technique (Braun & Clarke, 2006), which allowed grouping the participants' views into thematic categories such as: benefits, challenges, emotional engagement, technical issues, etc. The research was conducted in accordance with the principles of research ethics: anonymity and confidentiality of participants were ensured, participation was voluntary, and informed consent was obtained.

RESULTS

BENEFITS

The findings of the research highlighted a range of benefits arising from the integration of podcasts in the teaching of philological subjects:

Increased Interest and Engagement

The majority of students reported that the use of podcasts facilitated enhanced focus and a more active connection with the lesson content. According to educators, students demonstrate increased activity and participation when podcasts are employed in instruction, while auditory learning particularly supports students who are less responsive to traditional teaching methods. Specifically, a first-year high school student noted: "Listening to the podcast feels like hearing a story; unlike the textbook, it does not bore me." Another female student remarked: "Podcasts enabled me to continue the lesson outside the classroom, for example, during my commute to tutoring." Educators also concurred that podcasts provided a more immediate and personalized engagement with the material: "Students responded with greater enthusiasm when they listened to excerpts of literary works in podcast format. The audio 'captivated' them. They exhibited increased concentration" (Educator PE02).

Enhancement of Comprehension and Critical Thinking

Students develop critical faculties through listening to and analyzing podcasts, thereby facilitating comprehension, particularly in Literature and History. This medium contributed to a better understanding of complex concepts and situations, especially in the aforementioned subjects: "It helped me to better visualize the setting and grasp the emotional tone of the short story" (Student, 1st Grade High School). Concurrently, podcasts supported educators' pedagogical efforts and classroom interaction: "Podcasts served as a catalyst for highly engaging classroom discussions... they activated students' critical thinking" (Educator PE02).

Flexibility and Autonomy

Students have the autonomy to listen to podcasts at their convenience (asynchronous learning), which notably benefits those with varying learning paces. They can pause, replay, and annotate podcast segments, thereby enhancing knowledge assimilation. Students particularly emphasized the ease of access and the possibility of asynchronous listening, which allows them to engage with the material at any time or place: "I listened on my phone and could stop and replay as many times as needed if I did not understand something" (Student). Educators also recognized that this flexibility

reinforced self-regulation of learning: "The capacity for repetition aided students who typically lose focus and become distracted during class" (Educator).

Development of Creativity and Oral Expression

Philology teachers who incorporated podcast creation activities observed a marked increase in student participation. Educators reported enhanced creativity among students engaged in content production. Moreover, students involved in podcast creation practice essential research, writing, and oral communication skills. As expressed by students and educators: "Through producing our own podcast about a historical figure, I gained deeper understanding and felt empowered in the learning process" (Student); "Students learned to research, organize information, and articulate clearly—skills rarely cultivated through textbooks alone" (Educator).

CHALLENGES AND ISSUES

Despite the considerable benefits, several challenges were identified:

Technical Difficulties and Inequities

A primary challenge emerging from the research is the lack of appropriate equipment or digital literacy, which impedes access for some students: "At home, I have poor internet and struggle to download the files" (Student). Similarly, educators noted deficiencies in their own technical skills: "Initially, I did not know how to record or edit audio. I had to learn independently..." (Educator).

Limited Interaction

Although podcasts support learning, they do not substitute the direct interpersonal interaction achieved through classroom discussion, according to participants. Some students may feel alienated due to the absence of personal communication with the instructor. Despite engagement, many participants underscored the lack of immediate interaction: "I missed being able to ask questions directly. Listening to the podcast felt like a one-way communication without anyone to talk to" (Student). "The auditory experience cannot, under any circumstances, replace live discussion" (Educator).

Difficulty Integrating into the Curriculum

Educators predominantly expressed concerns regarding the effective and coherent incorporation of podcasts within the curriculum: "It is challenging to allocate time or integrate such tools within orientation classes under syllabus constraints" (Educator). "Institutional support is imperative; reliance solely on teachers' goodwill and dedication is insufficient" (Educator). Furthermore, some students prefer traditional learning methods and find adaptation difficult.

CONCLUSIONS AND RECOMMENDATIONS

The integration of podcasts in the teaching of philological subjects can impart new dynamism to the educational experience, provided it is implemented with targeted pedagogical planning and supported by appropriate training and technological infrastructure (Nikolaou & Koutsogiannis, 2020; Kara & Sevim, 2013). The present study's findings underscore that podcasts contribute to the establishment of a flexible and multimodal learning environment that enhances comprehension, expression, and collaboration. Based on these findings, the following key recommendations are proposed:

- Professional development for philology educators on the foundational principles of podcast creation, editing, and pedagogical integration (Tolisano, 2011; Danis & Mylonas, 2023).
- Development of targeted audio content functionally aligned with curriculum objectives and the requirements of nationally examined subjects.
- Encouragement of student podcast production as a form of creative writing, oral expression, and student voice empowerment (Middleton, 2010).
- Adoption of a hybrid teaching approach: integrating podcasts with traditional instructional methods to maintain direct interaction and avoid passive content reception (Chatzisavvidis, 2019).

DISCUSSION

The incorporation of podcasts into the teaching of language and literature subjects can offer a renewed dynamic to the learning experience, provided it is implemented through targeted pedagogical planning and supported by appropriate training and technological infrastructure (Nikolaou & Koutsogiannis, 2020; Kara & Sevim, 2013). The

findings of the present study highlight that podcasts contribute to the creation of a flexible and multimodal learning environment that enhances comprehension, expression, and collaboration. Based on these findings, the following key recommendations are proposed:

- Professional development for language and literature teachers on the fundamentals of podcast creation, editing, and pedagogical integration (Tolisano, 2011; Danis & Mylona, 2023).
- Development of targeted audio content that is functionally aligned with the objectives of the national curriculum and the requirements of standardized examinations.
- Encouragement of student-produced podcasts as a form of creative writing, oral expression, and amplification of student voice (Middleton, 2010).
- Hybrid teaching approaches that combine podcasts with traditional instructional methods, in order to maintain direct interaction and avoid passive content reception (Chatzisavvidis, 2019).

The results of this research are consistent with both international and national literature regarding the contribution of podcasts to the enhancement of students' cognitive and emotional engagement in language and literature education (McGarr, 2009; Lee & Chan, 2007; Passa & Tsakanika, 2021). Audio storytelling, in particular, can serve as a powerful tool for cultivating empathy, strengthening attention, and promoting active listening—especially in the context of literary and historical texts, where imagination and representation play a central role (Robin, 2008).

Despite the acknowledged benefits, the effective use of podcasts is contingent upon several external factors. These include: the technological infrastructure of schools and students (Adamopoulos, 2021), the adequacy of teacher training in both technical and instructional skills (Kalogiannidis & Papadimitriou, 2022), and the availability of supportive materials—such as ready-made or adaptable podcast resources tailored to classroom needs.

The lack of institutional recognition of audio tools as official teaching resources—and the reliance on individual educators' initiative—significantly limits their systematic application (Xochellis, 2018). Consequently, it is recommended that podcasts be formally integrated into educational policy as recognized digital learning tools, accompanied by consistent support for educators in utilizing them across all subject areas within the language and literature curriculum.

ABSTRACT

The present study focuses on best practices for integrating digital technologies into teaching through a holistic approach. Its aim is to present contemporary pedagogical strategies that leverage digital tools, highlight their advantages and inherent challenges, and propose specific applications in both the Greek and international contexts. Through the literature review, the exploration of innovative practices and the analysis of relevant policies and recommendations, the study aspires to provide a comprehensive resource for educators, researchers and educational institutions.

The methodological approach relied on an extensive review of recent research and case studies, aiming to identify current trends and innovative pedagogical practices using digital tools in education. The analysis was thematically organized, examining the implementation of technologies in blended and hybrid learning, the pedagogical potential of multimedia and interactive tools, the utilization of Virtual Learning Environments (VLEs) in teaching, as well as assessment and feedback practices through Learning Management Systems (LMS) and the role of Artificial Intelligence (AI) in enhancing personalization and optimizing the learning process.

The findings indicate that the purposeful, targeted and pedagogically informed use of digital technologies can significantly enhance active engagement, collaboration and self-regulation among learners, while also improving teaching quality and enabling real-time personalized assessment and feedback. In conclusion, it is argued that the systematic integration of digital tools within a holistic strategy framework fosters flexible, adaptive and effective learning environments.

Keywords: Digital learning tools, innovative pedagogical practices, VLEs, Artificial Intelligence, personalized learning, digital assessment systems.

INTRODUCTION

Digital technology has radically transformed education globally, creating new opportunities for learning, teaching and assessment. The integration of digital tools into educational processes is not merely a technological innovation but has emerged as a critical factor for improving learning quality, enhancing access to education and developing 21st-century skills (Selwyn, 2016; Bond et al., 2021). The digital transition –that is, the incorporation of digital media and tools into schools, universities and lifelong learning organizations– has become a key component of education policies worldwide, aiming to strengthen innovation, creativity, the learning experience, accessibility and student engagement (UNESCO, 2020; OECD, 2022).

In Greece, the digital transition in education has accelerated significantly in recent years, especially following the challenges posed by the COVID-19 pandemic. Through initiatives, such as the Digital Citizens Academy (Ministry of Digital Governance, 2020a), Lifelong Learning programs and collaboration with international platforms like Coursera for Greece, students and educators have been provided access to digital skills and high-quality educational content (Ministry of Digital Governance, 2020b). At the same time, investment in infrastructure and technological equipment is a necessary condition for ensuring equitable participation of all students, regardless of socio-economic background (Liebenberg, Chetty & Prinsloo, 2012).

This introduction establishes the framework for the following chapter, the Theoretical Framework, in which the key concepts, definitions, advantages and challenges of digital education will be examined, while also linking them to innovative pedagogical approaches that have already been successfully implemented at both international and national level.

THEORITICAL FRAMEWORK

Digital Education, Learning and Assessment

Definitions and Key Concepts

Digital education refers to the use of technological tools and digital platforms to enhance learning and teaching, as well as to prepare students for the contemporary digital world. It encompasses various forms, such as face-to-face teaching integrated with digital media, distance education, blended learning and hybrid learning (Halverson et al., 2014; Daskan & Yildiz, 2020). Digital technologies include educational LMS platforms (e.g., Moodle, Canvas, Google Classroom), multimedia, artificial intelligence applications, online collaboration tools, virtual simulation laboratories, interactive whiteboards, digital textbooks and online courses, through which students gain access to rich educational content that they can process at their own pace (Bond et al., 2021). These technologies enhance the educational experience, making learning more interactive, adaptive and engaging for students of all ages (UNESCO, 2020).

The pedagogical use of these tools requires their targeted integration into learning objectives, with emphasis on student engagement, personalized learning and the development of 21st-century skills (Becker et al., 2019; Ginting et al., 2024). Technology is not an end in itself but a tool that supports effective learning and must align with the goals of each curriculum and educational strategy.

Digital education offers multiple advantages, such as*:*

- **Flexibility and personalization:** Students can follow their own learning pace, repeat content, and access rich educational resources (Hrastinski, 2019). Personalization is further enhanced through artificial intelligence and data analytics systems that adapt teaching to each student's needs (Capuano & Caballé, 2020).
- **Collaborative learning:** Digital tools, such as forums, collaboration platforms and virtual classrooms, facilitate teamwork and interaction between students and educators (White, 2020; Bond et al., 2021).
- **Interactivity and active engagement:** The use of multimedia, gamification and interactive simulations transforms learning into an active process, promoting creativity and critical thinking (Krismanto, 2023; Ginting et al., 2024).
- **Immediate assessment and feedback:** LMS and digital assessment tools facilitate both the design and evaluation of teaching. They also allow the adaptation of teaching methods to students' needs and abilities, continuous monitoring of student progress, early detection of difficulties and provision of targeted feedback (Sanusi et al., 2023; Yahaya et al., 2024).
- **Development of digital skills:** Continuous use of digital tools prepares students for the demands of the digital labor market and strengthens their participation in social and political life (Samaila et al., 2024).

- Despite these advantages, digital education also faces challenges:
- **Digital divide:** Inequalities in access to technological equipment and reliable internet connection may lead to social and educational exclusion (Liebenberg, Chetty & Prinsloo, 2012).
- **Insufficient teacher training:** A lack of appropriate training reduces the effectiveness of technology in teaching and limits educational innovation (Krismanto, 2023; Selwyn, 2016).
- **Information overload:** The abundance of digital tools and content can cause confusion and reduce students' focus if there is no clear pedagogical design (Becker et al., 2019).
- **Data security and privacy:** The use of digital tools requires careful management of personal data and training in digital security (Rahman et al., 2020).

Innovative Teaching Approaches

Blended and Hybrid Learning

Blended and hybrid learning are contemporary pedagogical approaches that combine face-to-face teaching with distance education. Through this model, students have the opportunity to leverage the advantages of both forms of learning: direct interaction with the teacher and peers, combined with the flexibility of online learning (Garrison & Vaughan, 2008). Specifically:

Blended learning combines traditional face-to-face teaching with the use of digital tools, offering flexibility, personalization and an enriched learning experience. It does not replace the teacher's role; rather, enhances it, allowing educators to differentiate instruction, personalize student support and encourage collaborative learning. Educational technologies also enable continuous assessment of the learning process and the adaptation of instructional content to each student's needs (Halverson et al., 2014).

In the contemporary era of digital technology and educational innovation, blended learning emerges as an effective and flexible teaching model that can be applied across all education levels, from primary to higher education, as well as lifelong learning. By combining the benefits of traditional face-to-face teaching with the possibilities of online learning, blended learning provides students access to a broader range of educational content, greater autonomy and a personalized learning experience, as they can study digital content, participate in asynchronous activities and interact with teachers and peers in real time. Particularly in the aftermath of the pandemic, it has emerged as an effective strategy to ensure continuity in education, while promoting digital literacy and student autonomy (Daskan & Yildiz, 2020).

Blended learning constitutes a modern educational design that allows students to develop self-regulation, responsibility and time management skills, as they study at their own pace using diverse digital resources, such as educational platforms, interactive videos, self-assessment tests and discussion forums, while teachers can implement differentiated assessment and support methods (Hrastinski, 2019).

Hybrid learning represents a synthesis of distance and face-to-face education, where the digital component is integrated more organically into the teaching process, with part of the course conducted remotely and the remainder face-to-face. Rather than merely adding technological elements to a traditional classroom, hybrid learning fundamentally restructures how instruction is organized. Students attend part of the lessons remotely–either synchronously or asynchronously–and meet in person for targeted, experiential, or reflective activities. Hybrid learning emphasizes flexibility, differentiation, the use of digital technologies and active student participation. Additionally, it contributes to the development of self-regulation, responsibility and digital literacy skills (Almusaed, Almssad & Cortez, 2023).

The most common models of blended and hybrid learning include the flipped classroom, where theoretical content is studied at home and classroom time is devoted to collaborative activities and the station rotation model, in which students rotate between different learning stations with digital and analog tools (Horn & Staker, 2015).

These models have gained popularity because they enhance active engagement, critical thinking and collaboration, challenging conventional teaching approaches and allowing instructors to act more as guides and facilitators of knowledge rather than mere transmitters of information (Samaila et al., 2024). In the flipped classroom, students process educational material at home through videos, presentations or online resources, while class time is dedicated to applied activities, discussions and problem-solving.

The station rotation model is successfully implemented in higher education institutions where differentiated instruction is needed. Students are divided into groups and rotate between different learning stations, combining traditional and digital activities, such as online platforms, practical exercises, or collaborative discussions. This model

allows individualized support while promoting participation and interaction among students and instructors. Particularly for courses with laboratory or applied components, station rotation enables better utilization of time and available resources (Christina, Rusijono & Bachtiar, 2019).

Within this framework, Virtual Learning Environments (VLEs) such as Moodle, Blackboard, or e-Class play a significant role. VLEs are a core component of blended learning in higher education, as they allow students to attend courses remotely, interact with content, communicate with instructors and peers, and be assessed. They also promote continuous and asynchronous access to knowledge, enabling learning at one's own pace. Additionally, they offer the integration of multimedia, self-assessment tests, discussion forums and assignments, making the learning process more engaging and interactive (Dayag & Faramarzi, 2024).

Multimedia and Interactive Tools

The use of multimedia–sound, images, video, animations and interactive applications–has become an integral part of contemporary educational practice, as it significantly contributes to improving teaching and learning and enhances comprehension and retention by providing multiple sensory experiences (Krismanto, 2023). Interactive tools, such as educational games, simulations, digital maps and self-assessment platforms, allow students to actively participate in the learning process, transforming them from passive recipients into active explorers of knowledge (Ginting et al., 2024).

The use of multimedia applications, such as PowerPoint presentations, educational videos, simulation software, interactive maps and digital learning platforms, enables the personalization of teaching and its adaptation to the needs and learning styles of each student. Moreover, multimedia enhances creativity and critical thinking, offering opportunities for experimentation, problem-solving and the development of 21st-century skills, such as digital literacy and collaboration in online environments. At the same time, educators have new means to enrich their teaching and stimulate student interest, while multimedia can also be used for assessment and feedback in innovative ways. However, appropriate teacher training is required for the effective integration of these tools, along with careful instructional design to ensure that technology functions supportively rather than distractingly (Becker et al., 2019).

Artificial Intelligence and Personalization

Applications of Artificial Intelligence (AI) in education offer new possibilities for personalized learning. AI platforms can monitor students' performance in real time and recommend individualized content or exercises to address learning gaps (Capuano & Caballé, 2020).

AI also enables facilitates feedback by analyzing learning data to identify learning patterns and support students through targeted interventions. Simultaneously, educators can leverage these insights to improve lesson design and adapt instructional strategies to the needs of the class (Sanusi et al., 2023; Yahaya et al., 2024).

Combined with multimedia and digital platforms, AI creates a dynamic learning environment that supports differentiated instruction, active engagement and personalized learning, while enhancing students' digital skills, which are essential for the knowledge society (Samaila et al., 2024).

Digital Assessment Systems

Modern technologies have revolutionized the way assessment and feedback are conducted in education. Traditional assessment, which mainly relied on written exams at the end of a teaching unit, has increasingly been complemented by more interactive, immediate and personalized processes. Through the widespread use of Learning Management Systems (LMS) (e.g., Moodle, Canvas, Google Classroom), assessment can take place in real time, offering continuous feedback to both educators and students (Sanusi et al., 2023; Yahaya et al., 2024).

Data collected through LMS allow for long-term monitoring of student progress across activities, quizzes and tests, the identification of learning difficulties, the adaptation of content and the design of targeted interventions. At the same time, students gain clearer insight into their progress and are encouraged to adopt a more active role in learning process. The integration of analytical tools produces reports and visualizations that improve data understanding, enhance student self-awareness, and facilitate collaboration with parents and school administration (Yahaya et al., 2024).

The use of these tools is closely connected to AI applications and personalized learning. AI platforms can monitor performance in real time and recommend personalized content or exercises to address weaknesses, supporting

differentiated instruction and enabling educators to design individualized learning pathways (Capuano & Caballé, 2020; Sanusi et al., 2023; Yahaya et al., 2024).

Overall, the combined use of multimedia, interactive tools, VLEs and AI, fosters a comprehensive learning environment that enhances active participation, personalizes learning, supports student self-regulation and enables real-time assessment. This holistic approach cultivates the development of essential 21st-century skills, including collaboration, critical thinking and digital literacy (Becker et al., 2019; Samaila et al., 2024).

LEVERAGING DIGITAL TECHNOLOGIES IN EDUCATION: INTERNATIONAL AND GREEK BEST PRACTICES

In educational process, best practices for utilizing digital technologies include multiple strategies that enhance learning:

- Technology should support learning objectives rather than define them, as the alignment of digital tools with the curriculum and teaching strategies is a key prerequisite for effectiveness (Becker et al., 2019).
- Simultaneously, the use of digital forums, collaboration platforms and virtual classrooms promotes active participation, communication and problem-solving (White, 2020).
- Artificial intelligence allows personalized instruction based on each student's performance, enhancing support for those facing difficulties (Capuano & Caballé, 2020).
- Additionally, LMS and multimedia tools enable continuous assessment and immediate feedback, enhancing students' self-regulation (Simon & Zeng, 2024).
- Finally, education in safe internet use and responsible social media usage is a critical component for ensuring digital responsibility (Rahman et al., 2020).

The integration of digital technologies in education has also been adopted internationally through various examples and initiatives, aiming to enhance the learning process, adapt to each student's needs and improve educational quality (Bond et al., 2021) in:

➢ *United States and Canada*

Schools and universities use LMS platforms such as Moodle and Canvas for course organization, assessment and real-time feedback. The implementation of the flipped classroom has improved student engagement and academic performance, enabling educators to focus more on guidance and individualized support (Samaila et al., 2024). Furthermore, the integration of multimedia, interactive tools and AI has enhanced personalized learning and facilitated long-term progress monitoring (Capuano & Caballé, 2020).

➢ *Europe*

In Scandinavia and the Netherlands, digital education is systematically embedded in the curriculum. The use of multimedia, collaborative platforms and gamification has resulted in higher levels of engagement, deeper understanding and greater student autonomy (Ginting et al., 2024). In the United Kingdom, schools foster the development of digital skills through targeted programs combining asynchronous and synchronous learning.

➢ *Asia and Australia*

In Asia, countries such as Singapore and South Korea invest in comprehensive digital learning ecosystems that support personalized instruction and continuous data-driven analytics. Australia emphasizes lifelong learning and the development of digital skills through programs spanning all education levels (Liebenberg, Chetty & Prinsloo, 2012).

In **Greece**, in line with international trends, significant progress has been achieved in recent years in the integration of digital technologies into education, aiming to enhance the learning experience, address individual student needs and improve overall educational quality. In particular:

- Through public and private initiatives, such as the Digital Citizens Academy (Ministry of Digital Governance, 2020a), the Lifelong Learning program and the Coursera for Greece platform, students and citizens have access to high-quality digital courses, either free of charge or at low cost (Ministry of Digital Governance, 2020b).
- Universities have adopted blended learning models supported by VLE platforms such as Moodle, Blackboard and e-Class, providing access to remote content, collaboration opportunities and asynchronous learning (Dayag & Faramarzi, 2024). The flipped classroom and station rotation models are applied in laboratory courses, fostering active participation and the practical application of knowledge (Christina, Rusijono & Bachtiar, 2019).

- Teachers' digital competence has been strengthened through professional development programs and ongoing training, covering the use of LMS, multimedia and AI tools. At the same time, equity- oriented policies ensure that all students, regardless of socioeconomic background, have access to digital resources and reliable internet connectivity (Krismanto, 2023; Liebenberg, Chetty & Prinsloo, 2012).

STRATEGIC DIRECTIONS FOR DIGITAL EDUCATION IN GREECE

The integration of digital technologies in education requires strategic planning and supportive policies to ensure equal learning opportunities for all students and the effective utilization of new technologies. Greece, like other European Union countries, is called upon to adapt to the rapid digital transition and to develop holistic strategies that enhance digital literacy and citizens' participation in the knowledge society (Ministry of Digital Governance, 2020a).

Strengthening digital infrastructure is a critical factor for equitable access to learning. This includes upgrading school laboratories and technological equipment, such as computers, interactive whiteboards and high-speed network infrastructures (Selwyn, 2016), as well as ensuring reliable internet access for all schools, regardless of geographic location or socioeconomic background (Liebenberg, Chetty & Prinsloo, 2012).

At the same time, continuous professional development for educators is fundamental for the effective integration of digital tools. In this context, educational programs should cover the use of LMS, multimedia, collaboration platforms, artificial intelligence tools and the integration of pedagogical strategies for blended and hybrid learning, as well as the creation of mentoring and peer-learning mechanisms to support teachers (Krismanto, 2023).

Furthermore, developing students' digital skills contributes to their autonomy and effective participation in learning, through the integration of digital literacy programs at all educational levels, strengthening critical thinking and responsible internet use and promoting collaboration and creativity through multimedia tools and gamification technologies (Samaila et al., 2024; Rahman et al., 2020).

Blended and hybrid learning should also be central to educational policy, with the creation of supportive frameworks for digital content, adaptation of curricula, and the use of real-time assessment tools to monitor student progress (Halverson et al., 2014; Yahaya et al., 2024).

Finally, the digital transition must reinforce social cohesion and reduce digital exclusion by providing assistive technologies for students with special needs, facilitating access to digital resources for students from low-income backgrounds and regularly evaluating policies to identify and address inequalities (Carmen et al., 2024).

Effective digital policy requires a holistic approach, combining legislative frameworks for data security and the use of digital media, collaboration between the public and private sectors for the development of high-quality digital content and continuous monitoring and feedback on policies (Krismanto, 2023; Carmen et al., 2024).

The implementation of these strategies ensures that Greece can follow international best practices, enhance the quality of learning and prepare students for a digital and innovative future.

CONCLUSION AND FUTURE DIRECTIONS

The integration of digital technologies in education is no longer merely a technological innovation but a strategic investment in human capital development and social progress. The use of digital tools offers significant advantages, such as personalized learning, enhanced collaboration, development of digital skills and increased student engagement.

Blended and hybrid learning approaches, supported by educational technologies, have emerged as highly effective models for developing flexible and personalized learning pathways. They create a dynamic and interactive learning environment where traditional and digital education coexist and complement each other, while simultaneously enhancing the quality and accessibility of learning. These approaches provide opportunities to combine traditional teaching with digital applications, such as virtual laboratories, simulations and LMS platforms, fostering active participation and critical thinking. They also support educators in their role as guides and mentors to students.

Blended learning models in higher education respond to the increased demands of modern students and the academic environment. They offer high-quality learning experiences, enhance student autonomy and active engagement and encourage instructor adaptability. Successful implementation requires appropriate teacher training, technological infrastructure and pedagogical design focused on student needs.

Moreover, multimedia tools and interactive applications provide new opportunities for creating a more engaging, flexible and effective learning environment adapted to the demands of the digital era. Through the integration of audio, visuals, video and digital simulations, students become active explorers of knowledge, while educators gain new tools for assessment, feedback and adapting instruction to each student's needs.

The application of Artificial Intelligence (AI) in education further expands the possibilities for personalized learning, enabling customized learning pathways and timely interventions for learning difficulties.

At the same time, real-time assessment and feedback through digital technologies and the utilization of data via LMS contribute to personalized instruction, enhance student self-regulation and promote the development of critical thinking skills.

Finally, the development of digital skills is a necessary prerequisite for students' and citizens' active participation in the knowledge society. Initiatives ensuring equitable access to digital resources strengthen social cohesion and help address the digital divide, ensuring that all students can fully benefit from the advantages of digital education.

The future evolution of digital education in Greece should focus on three main axes to enhance learning quality and fully exploit the possibilities of the digital era:

- **Technological Innovation:** Continuous integration of new technologies, such as AI, augmented and virtual reality, combined with multimedia and interactive tools, to create personalized and engaging learning experiences.
- **Professional Development:** Extensive training programs for educators in the use of pedagogical strategies with technology, enhancing digital literacy and familiarization with LMS, AI tools and multimedia environments.
- **Innovation and Social Cohesion Policies:** Establishing a national strategic framework, utilizing data to improve policies and ensuring equitable access for all students.

Overall, when adopted holistically, digital education offers the opportunity to transform teaching practice, enhancing learning quality, student engagement and teacher professional development. With targeted policies, appropriate infrastructure and continuous training, Greece can fully harness the potential of the digital era while simultaneously strengthening competitiveness and social cohesion.

eTwinning: BUILDING A STRONG COMMUNITY OF INNOVATIVE TEACHERS

Paraskevas Michael
Professor of the University of Peloponnese, Vice President of CTI "Diophantus",
Head of National Support Organization for eTwinning
Patras, Greece
email: mparask@cti.gr

ABSTRACT

eTwinning has been designated a flagship action by the European Commission with the objective of fostering educational innovation, promoting collaborative learning, developing digital skills and encouraging intercultural understanding. Since 2005, Greece has cultivated a dynamic community of teachers, schools and pedagogical students who have implemented thousands of collaborative projects, many of which have received high distinctions. The eTwinning National Support Organization cultivates competences related to ICT, AI and modern teaching methodologies through a variety of means, including its Open Online Courses, STEM activities, the Initial Teacher Education initiative and other actions. The network of ambassadors and institutional partners facilitate the dissemination of good practices and participation in international competitions, while publications and digital repositories support the dissemination of knowledge. The Greek experience corroborates the function of eTwinning as a catalyst for the transformation of educational culture and the establishment of robust learning communities at both the national and European levels.

Keywords: eTwinning, Teacher training, Professional development, MOOCs, STEM education, AI in education

INTRODUCTION

The rapid development of Information and Communication Technologies (ICT) and the need to cultivate 21st-century skills have made educational innovation a key policy priority at both the national and international levels. eTwinning is a flagship initiative of the European Commission, launched in 2005 and integrated into the Erasmus+ programme. It has now developed into a wide-ranging transnational network for the creation of collaborative projects, the exchange of good practice, and the professional development of teachers. The utilization of digital tools has been instrumental in fostering open learning methodologies and facilitating cross-border collaboration between educators and students. This has led to its emergence as one of the most prominent networks on the global stage, undoubtedly marking a historic milestone in the evolution of education.

In Greece, the profound impact of eTwinning is exemplified by the over 40,000 active teachers from 14,000 school units, with a plethora of collaborative projects, many of which have been recognized with prestigious accolades. The action in Greece is supported by the National eTwinning Support Organization (NSO), which operates under the responsibility of CTI "Diophantus" in close cooperation with the Ministry of Education. The NSO provides training, professional development of teachers, networking, technical and pedagogical support, and promotes the integration of the programme into national education policies.

A well-organized series of actions, including open online courses, MOOCs, Initial Teacher Education, the ambassador network, quality labels, national and European competitions, actions for the integration of STEM and AI in collaborative projects, synergies with national education policy bodies and others, constitute a multidimensional framework. Within this framework, educational innovation and modern digital skills are fostered, collaborative culture is developed, professional development is enhanced, and European identity and intercultural understanding is promoted. The role of the Greek NSO is pivotal for the sustainable dissemination of results, contributing to a strategic mechanism for educational upgrading and fostering innovation in the national education system.

The following sections will present the actions of the Greek NSO of eTwinning, which contribute to the growth and development of the Greek eTwinners community of teachers. Firstly, the following discussion will present the main research findings on the impact of eTwinning on digital competence and teaching practices. This is followed by the section "Training Actions" with quantitative and qualitative data on participation and evaluation; then the "Networking and Professional Development Actions" are examined, followed by the presentation of the "Recognition and Reward" mechanisms. The section entitled "Partnerships with Education Policy Bodies" documents the link with universities, national bodies and other actions, while the section "Specific Actions" focuses on targeted programmes (STEM, AI). The paper concludes with an Executive Summary, which synthesizes the key findings and draws conclusions and policy recommendations, and a Bibliography to support the references.

LITERATURE REVIEW

The eTwinning programme is a European educational initiative that facilitates collaboration between teachers and students from different countries through the use of Information and Communication Technologies (ICT). It is widely regarded as one of the most influential educational initiatives in Europe. A substantial body of research has demonstrated that there has been a considerable enhancement in teachers' digital competence, which has also been observed to be transferred to their students. Seklou (2023) has highlighted an increase in teachers' confidence in the utilization of digital tools, while Arabatzis (2020) has noted the adoption of novel teaching methods and the enhancement of technological skills in secondary schools. In a similar vein, Boukla (2018) and Voutyra (2008) have drawn parallels between the utilization of digital media in primary education and the provision of personalized lessons. Concurrently, eTwinning has been shown to enhance collaborative and communication skills (Kyriakidou, 2021). Furthermore, Kollitidou (2018) has emphasized its contribution to a culture of teamwork, and its role in improving communication and team coordination through e-learning has also been highlighted (Kollitidou, 2018). Gouvetzou (2018) emphasizes the pedagogical value of teleconferencing, while Ioannidou (2020) and Mastori (2017) document the importance of training activities in professional development and networking. Alexiou (2019) examines collaborative platforms for teaching mathematics, finding improvements in understanding and interdisciplinary thinking, while Tzilou (2018) highlights the contribution of digital art to creativity and autonomy. In the domain of preschool education, Spitsa (2017) posits that digital games have the potential to enhance group learning and social development. Finally, Drakontaidis (2015) highlights the contribution of eTwinning to intercultural exchange, tolerance, and European awareness. A comprehensive review of the extant literature confirms that eTwinning is a multidimensional tool for educational innovation, offering measurable benefits in terms of skills, collaboration, teaching practices, and intercultural awareness.

TRAINING ACTIONS

The Greek NSO of eTwinning provides a comprehensive framework of training, collaboration and support services for the educational community, promoting the integration of modern ICT in eTwinning projects and in educational practice, through activities such as Open Online Courses, MOOCs, and eTwinning Ambassadors' training workshops. Let's look at them in detail.

Open Online Courses & MOOCs

Since 2017, the Greek NSO of eTwinning has been offering the Open Online Courses service[2]. These educational cycles are organized on an annual basis, with each cycle comprising 160-200 teaching hours. The thematic focus of these cycles encompasses the pedagogical utilization of ICT, Web 2.0 tools, Educational Robotics, STEM and Artificial Intelligence, with a view to facilitating collaborative activities and their integration within the context of classroom teaching. Since 2021 to date, the programme has trained over 70,000 teachers and students, and for the 2025-26 academic year, enrolment has reached 25,500. In the autumn of 2024, two new pilot courses were introduced: one focused on the use of interactive whiteboards, and the other on robotics kits. These additions brought the total number of courses offered related to educational robotics and STEM to eight. Approximately 1,500 trainers provide support to trainees, who are granted full access to the training material. Trainees are also tasked with developing assignments and practical exercises, and are subject to assessment before being awarded a certificate of successful completion. A central team of the NSO is responsible for the maintenance of the technical infrastructure, the creation of training material, and the supervision and coordination of the training process. To elaborate further, during the academic years 2021-22 to 2024-25, the courses delineated in the table were made available, with a total of 72,540 teacher registrations recorded.

Table 1
Enrolment of teachers in open online courses

Online course \ School year	2021-22	2022-23	2023-24	2024-25
E-learning platforms - Tools for the production of educational material - Communication tools	2.192	1.807	2.188	2.716
Multimedia editing tools - Tools for the production of educational material	2.293	2.767	2.940	2.505
Website creation tools - Collaborative and support tools	1.470	2.119	2.392	2.269
Online learning communities and use of learning objects	779	987	1.249	1.506
Creative and safe Internet - Evaluation and development of critical thinking about digital content	876	919	1.009	1.240
Arduino Basic: Introduction to educational robotics using Arduino	614	813	632	416
Arduino Intermediate. Instructional Robotics using Arduino	-	291	253	111
Educational robotics with Edison	174	174	105	72
Educational robotics with Micro:bit	-	376	340	358
Educational robotics with Thymio	224	216	153	-
Educational robotics in kindergarten - Beebot	877	1.200	1.044	752
Scratch programming and educational robotics	1.412	1.383	1.211	595
Mobile devices 1 (Tablets and mobile phones) - Basic use	912	1.434	1.078	541
Mobile devices 2 (Tablets and mobile phones) - Use in teaching courses	1.491	2.071	2.461	1.214
Pedagogical use of AI in eTwinning projects and in course teaching	-	-	2.685	4.459
Use of interactive systems in teaching	-	-	-	3.245
Educational robotics with the new S1 robotics kit	-	-	-	715
TOTAL	13.529	16.557	19.740	22.714

[2] https://seminars.etwinning.gr

Two of the aforementioned courses are also offered in English for teachers from European Schools (Brussels) and for teachers from Tunisia, Lebanon, Jordan, Georgia and Armenia, which the Greek NSO has undertaken to support. In relation to the qualitative strand, the evaluation of the courses using the official methodology, Selfie4Teachers, of the European Commission demonstrated a 17% increase in digital skills among the trainees (54% post-course in comparison to 37% pre-course) and a 15% increase among the trainers (75% in comparison to 60% pre-course). This finding serves to confirm the effectiveness of the combined theoretical and experiential training methodology. As the new school year, 2025-26, approaches, it is reported that a total of 18 courses will be offered, with enrolment having reached 25,496 and 1,528 trainers scheduled to support the learning process. These figures represent the highest recorded since the inception of the initiative in 2017.

Massive Open Online Courses - MOOCs

From 2022, the Greek NSO of eTwinning will offer training services in the form of Massive Open Online Courses (MOOCs[3]) on:

- The eTwinning community, the educational material provided by eTwinning, European School Education Platform (ESEP) and EU Academy for their professional development, networking and for the implementation of collaborative eTwinning projects.
- The use of the Community, actions and educational material provided by eTwinning for the implementation of Skills Workshops as collaborative projects.
- The introduction to the Community, the actions and the educational material provided by eTwinning and the European School Education Platform (ESEP) to students of Greek Universities, for their professional development and for the implementation of collaborative eTwinning projects.

More specifically, since 2022 to date, the MOOCs listed in Table 2 have been offered.

Table 2
Massive Open Online Courses (MOOCs)

MOOC title	Offered	Participated
eTwinning & Skills Workshops: collaborative activities for the cultivation of knowledge, skills and competences	2022 and 2023	7,728 teachers
Introduction to eTwinning, the European action for education	2023, 2025	6,411 teachers
Designing a Quality, Collaborative eTwinning project	2024	1,908 teachers
European eTwinning in Higher Education	2024	195 students and university teachers
European eTwinning in Higher Education (self-paced)	2024, 2025	
Use of AI in Education and eTwinning projects	2025	• > 5,000 registrations

Ambassador Training Workshops

The volunteer body of eTwinning Ambassadors performs a pivotal function, providing guidance to educators in their respective domains to facilitate the implementation of eTwinning projects. In addition to other activities, they facilitate training workshops, either as webinars or face-to-face training, on a range of topics, including "Awareness-raising for people not registered for eTwinning", "Presentation of the eTwinning platform", "Twinspace", "Enhancing the quality of eTwinning projects", "eTwinning Schools", "Digital Tools and eTwinning", "eTwinning and Skills Workshops" and "eTwinning and Initial Teacher Education". During the academic years 2022-23, 2023-24 and 2024-25, a total of 450 online workshops were delivered by ambassadors, reaching an estimated 30,000 teachers.

NETWORKING & PROFESSIONAL DEVELOPMENT ACTIONS

The Contact Seminars / Multilateral Seminars (CS/MS) and the Professional Development Workshops (PDW) represent two pan-European eTwinning actions which have been designed with the objective of promoting the professional development of teachers and expanding cooperation between schools in Europe. It is evident that both forms of action have a substantial impact on the eTwinning community. CS/MS contribute to the expansion of the European

[3] https://mooc.etwinning.gr/

network of teachers, the establishment of communication channels and the promotion of intercultural understanding. The integration of PDWs into scientific and pedagogical training has been demonstrated to enhance both these fields. Furthermore, the integration of ICT in teaching has been shown to foster a culture of innovation. The outcomes of these initiatives are twofold: firstly, the development of collaborative projects with a demonstrable impact on students; secondly, the active involvement of students in international learning experiences. These experiences are critical for professional development and networking, and serve to strengthen the eTwinning community as a European community of learning and innovation.

Contact Seminars / Multilateral Seminars

Contact Seminars / Multilateral Seminars (CS/MS)[4] are characterised by their strong cross-border nature, with the objective of establishing new partnerships between teachers from diverse international backgrounds. These events offer a distinctive networking opportunity, as they facilitate the convergence of teachers who share common interests and are seeking collaborators to execute European-based projects. The thematic focus of these initiatives aligns with European educational priorities, encompassing digital innovation, environmental education, social inclusion, STEM education, and even AI. In the course of the workshops, participants are required to present their ideas, work in small groups, design collaborative projects and lay the foundations for joint actions through eTwinning. The Greek eTwinning Network has been responsible for the organisation of specialised Communication Seminars, with a recent focus on STEM and Artificial Intelligence (AI). A paradigmatic example is the seminar entitled "Applications, Tools and Perspectives of AI in Education", which was held from 10-12 May 2024 at the CTI "Diophantus" in Patras. The seminar was designed for secondary school teachers with either basic or intermediate experience of eTwinning, with the aim of enhancing their skills in integrating AI in European collaborative projects. A recent example of this is the seminar entitled "Ancient Greece's STEM resources for eTwinning", which was held from 2-5 April 2025 in Pylos, Messinia. The aim of the seminar was to assist teachers in the organisation of European eTwinning projects with STEM themes, by examining the development of the skills that are considered to be fundamental to mathematics, technology, science and engineering in modern society, as they were in Ancient Greece. In both seminars, the programme comprised theoretical presentations, practical workshops, networking activities and the establishment of new collaborative eTwinning projects.

Professional Development Workshops

The nature of PDW[5] events is such that they are intensive training exercises. It is asserted that the programme proffers eTwinners the opportunity to achieve a more profound comprehension of contemporary pedagogical issues and to acquire knowledge of innovative teaching methodologies that they can apply in the classroom. The subjects addressed are diverse, encompassing themes such as project-based learning, the cultivation of fundamental skills (language, mathematics, digital literacy), cultural heritage, ecology, and the utilisation of digital tools, among others. Teacher participation is by selection, based on a set of criteria. These include active presence in the eTwinning community, foreign language proficiency and the ability to use ICT in teaching. Participants will acquire practical experience, exchange good practice and develop skills that will enhance their effectiveness and innovation in their work through presentations, hands-on workshops and group activities.

RECOGNITION & REWARD ACTIONS

eTwinning has established and is implementing a comprehensive recognition and reward framework with the aim of promoting educational innovation and the professional development of teachers. This framework encompasses national award competitions, wherein educational institutions that have demonstrated excellence in various competitions are recognized with technological equipment, thereby further enhancing their pedagogical practices. At the European level, the European eTwinning Awards represent the highest form of recognition for projects that embody educational value and innovation. It is evident that participation by Greek teachers has consistently yielded notable achievements in all European competitions. The annual national eTwinning conferences have been demonstrated to strengthen the Community by acting as a forum for knowledge dissemination, networking and training. It has been demonstrated that quality control procedures (i.e. the national and European quality labels) and international teacher missions, function in a complementary manner, thereby ensuring that recognition is translated into synergies, professional development and the implementation of educational innovations in the classroom.

[4] https://etwinning.gr/professionaldevelopment/cs
[5] https://etwinning.gr/professionaldevelopment/pdw

National Competitions & Awards

It is evident that the annual national competitions within the context of Greek eTwinning play a pivotal role in the recognition and rewarding of participants. The Greek NSO is responsible for the organization of these events, and by 2024, 19 national competitions had been held. Eligible participants are those collaborative projects that have been awarded a National Quality Label (NQL). The evaluation is conducted by a panel of expert evaluators who employ specific criteria that are applicable in all 46 countries where eTwinning is implemented. The national competitions have been conceived with the objective of recognizing projects that incorporate high pedagogical value, highlighting good practice and strengthening the implementation of projects in the classroom. The awards are presented in a public forum at special ceremonies, which are often held as part of the annual national eTwinning conference. The projects which are selected as winners are subject to public dissemination, and are included in publications such as the Pedagogical Guides. The winning schools are awarded prizes, which may take the form of tablets or 3D printers, among other items. For instance, in the 17th national competition (2022), 32 schools were awarded 3D printers and tablets; in the 18th national competition (2023), 20 schools were awarded 3D printers and tablets; and in the 19th national competition (2024), 17 schools and two university departments were awarded tablets.

European Competitions & Awards

Alongside the national competitions, a pan-European competition is held every year, in which collaborative projects that have been awarded the European Quality Label (EQL) can participate. The European eTwinning Awards are the highest recognition at European level for collaborative projects in terms of innovation and pedagogical impact. Nominations are evaluated by international panels on the basis of clearly defined criteria (pedagogical evidence, collaboration, innovation, impact). The distinctions for collaborative projects at European level enhance the dissemination and replication of collaborative practices, provide a platform for networking and encourage the documentation of learning outcomes in an international context. The winners are awarded at the annual European eTwinning Conference. The eTwinning projects involving Greek teachers are always distinguished in the European competitions and ranked in the highest positions. Specifically, in 2022, 6 Greek schools and 8 Greek teachers participating in 5 winning projects[6] were awarded, in 2023, 5 Greek schools and 8 Greek teachers participating in 5 winning projects[7] were awarded, in 2024, 9 Greek schools and 15 Greek teachers participating in 4 award-winning projects[8] and in 2025, 8 Greek schools and 12 Greek teachers participating in 2 award-winning projects[9] . The systematic presence of Greek teachers in this highest distinction proves the high quality fulfilled by the collaborative projects founded or participated in by Greek schools and the awards document the quality and innovation of these projects.

National eTwinning Conference

The annual national conference is another well-established action of Greek eTwinning with a clear scientific character. It has been held continuously since 2014, in cities such as Patras, Athens, Ioannina, Syros and Thessaloniki. During the covid-19 pandemic it was conducted online, and from 2021 until today it is conducted in a hybrid format. The main purpose of the conference is to encourage creative dialogue between teachers around the implementation of innovative teaching methods using eTwinning. One of the characteristics of the conference is the very high participation of teachers and the presentation of a variety of scientific papers. For example, the 9th conference[10] (2023, Syros) featured 167 papers, 21 workshops, 7 keynote speeches and a round table on educational innovation, while the 10th conference[11] (Athens, 2024) featured 105 papers, 15 workshops, 16 keynote speeches and a round table on AI in Education and eTwinning collaborative projects. The impact of the national eTwinning conference on the educational community is manifold: it fosters the dissemination of innovative teaching practices, enhances teacher networking, promotes collaborative actions, and fosters modern digital skills.

International Missions of Greek Teachers

Another action that acknowledges and rewards eTwinners is their involvement in international professional development workshops (PDW) and partner search seminars (CS/MS). These missions are intended for both distinguished teachers and novices, with the objective of establishing transnational partnerships and scaling up successful classroom

[6] https://www.etwinning.gr/awards/eawards/1114-etwinning-2022-4-6-8-etwprizes22

[9] https://www.etwinning.gr/awards/eawards/1583-etwinning-2025-5-9-13-etwprizes25
[10] https://etwinning.gr/conf2023
[11] https://www.etwinning.gr/conf2024

practices. Participation in PDW/CS facilitates direct knowledge transfer and enhancement of the participants' professional identity. The Greek eTwinning organization is responsible for the coordination of international missions for Greek teachers, with a yearly average of more than 50 teachers being sent to various countries for this purpose.

COOPERATION WITH EDUCATION POLICY BODIES

The establishment of collaborative relationships between the Greek NSO of eTwinning and national education policy bodies is a pivotal element in both the promotion of innovation in education and the consolidation of the eTwinners' community. These partnerships entail the establishment of connections between the school community and institutions of higher education, as well as national education policy bodies and European mobility programmes. The Initial Teacher Education action is intended to inform pedagogical students about eTwinning and its services, while the collaboration with the Institute for Education Policy creates a framework for the use of Skills Workshops through collaborative projects. The synergy with the State Scholarship Foundation serves to strengthen the link between eTwinning and the Erasmus+ programme, while the cooperation with the National Centre for Public Administration and Local Government ensures the provision of extensive (free) training of teachers on eTwinning.

Cooperation with Universities - Action: Initial Teacher Education

The eTwinning's Initial Teacher Education[12] (ITE) action has been designed to enhance the initial training of prospective teachers, with the objective of cultivating collaborative, pedagogical and digital competencies from their university years onwards. In Greece, the NSO is collaborating with academic institutions to propose two primary directions for integration: firstly, the incorporation of a designated module, entitled "Introduction to eTwinning", within existing curricula; and secondly, the advancement of small-scale collaborative eTwinning initiatives, encompassing both teacher-student and student-student interactions, with a particular emphasis on student placements. It is evident that the vast majority of Greek universities are engaged in this initiative, with twenty (20) pedagogical departments incorporating pertinent activities. During the 2024-2025 academic year, sixteen lecturers integrated eTwinning into the curriculum, training more than 400 students. Concurrently, 24 national and European projects were designed and implemented, as well as two collaborative projects with kindergarten students in the context of student internships. In order to provide support for this endeavor, the "eTwinning ITE MOOC 2024" course has been developed. This course is offered in a self-paced format. In the 2024-25 academic year, enrolment exceeded 600, indicating its considerable potential. The programme's continuation has already been scheduled for the 2025-26 academic year. It is evident that the accreditation of Greek university departments is being augmented by the conferral of the National ITE Label. In the 2024 academic year, three departments are scheduled to be recognized, with this figure increasing to six in the subsequent 2025 academic year. In 2024, Greece participated for the first time in the European competition for the ITE Award, and in 2025 it will again be represented by a university department, thereby confirming the country's substantial contribution to the European academic and educational community.

Cooperation with the Institute of Education Policy

The present collaboration between the Greek NSO of eTwinning and the Institute for Educational Policy (IEP) has been initiated with the objective of implementing the Skills Labs in a collaborative manner through the eTwinning platform[13]. The programme is founded upon a programmatic agreement between the CTI "Diophantus" and IEP, and is administratively documented by circulars of the Ministry of Education and Science, which provide guidelines to schools. In order to facilitate the training of teachers, a MOOC has been developed under the title of "eTwinning & Skills Labs: Collaborative Actions for the Cultivation of Knowledge, Skills and Competencies". The primary objectives of the course are twofold: firstly, to emphasize the utilization of the eTwinning community, activities and educational material for the implementation of Skills Labs; and secondly, to present the steps for transforming activities from the eTwinning digital repository into collaborative eTwinning actions implemented by groups of students and teachers from two or more schools. The course was offered on two occasions, in 2022 and 2023, and a total of 7,728 teachers were trained, indicating the substantial reach of the initiative at national level. Simultaneously, the Community was presented with an "e-book of good practices for skills workshops in eTwinning"[14], which was made available for their use. This development was instrumental in ensuring the sustainability of the action.

Cooperation with the State Scholarship Foundation

The collaboration between the NSO of eTwinning and the State Scholarships Foundation (IKY) serves as a paradigmatic illustration of the integration of two institutional frameworks that are pursuing complementary objectives. On the one hand, the development of a network of professional learning for teachers (through eTwinning) is promoted, and on the other hand, the internationalization of school education is strengthened through the Erasmus+ KA1 and KA2 actions. The training workshops, organized in conjunction with other institutions, fulfilled a dual function. Firstly, they provided a theoretical framework and interpretative tools for understanding Erasmus+. Secondly, they offered practical guidance on application, accreditation procedures and the use of electronic tools such as SELFIE. The involvement of IKY staff in the National eTwinning Conferences has been instrumental in establishing institutional recognition for the cooperation, thereby fostering the dissemination of a culture of transnational collaboration within the school environment.

Cooperation with the National Centre for Public Administration and Local Government

The nationwide distribution of the eTwinning course for teachers by the Training Institute (IN.EP.) of the National Centre for Public Administration and Local Government (NCPA)[15] represents a significant intervention in the professional development of teaching staff, with an emphasis on the utilization of digital tools and collaborative practices promoted by the eTwinning network. The course is offered free of charge and aims to broaden the knowledge and skills of teachers across the country. This approach functions as a multiplier, as it equips teachers with the requisite tools to develop collaborative projects, thereby reinforcing pedagogical innovation and the utilization of teaching methods that incorporate new technologies.

ACTIONS for STEM & AI Integration in Education

This section will analyze the NSO actions for integrating STEM and artificial intelligence in education as tools for strengthening the teaching community. The document will delineate the structure of these actions and the procedures for selecting and supporting schools. The presentation will comprise quantitative data pertaining to participation, alongside qualitative assessments, exemplars of teaching materials, and mechanisms for dissemination.

The STEM Action in Teacher Community Empowerment through eTwinning

The STEM eTwinning action[16] has been identified as a prime exemplar within the domain of Greek education, demonstrating remarkable levels of organization and efficacy. Its core objective is to facilitate the integration of STEM (Science, Technology, Engineering and Mathematics) technologies across all levels of school education, operating within a structured and supported framework. In Greece, the number of schools participating in the initiative stands at approximately 1,000. The core of the initiative lies in the provision of robotics equipment that has been adapted to the educational level of each school, in conjunction with an integrated ecosystem of professional development and pedagogical innovation services. The selection of schools is based on eTwinning criteria, such as teachers' distinction in national or European eTwinning competitions or their active participation in the Community. Training is implemented through open online courses and MOOCs, which focus on both technical skills and pedagogical applications of STEM education. The efficacy of the initiative is substantiated by the generation of superior educational resources. An illustrative example is the guide "Educational robotics in kindergarten with Beebot" (Foti, Tzimopoulos & Bratitsis, 2023), which presents lesson plans developed by trained teachers. Furthermore, Greek teachers have been recognized with prestigious European awards for their contributions to STEM projects, thereby affirming the global acclaim of their endeavors. The dissemination of results is enhanced through the National eTwinning Competitions, where winning schools are rewarded with technological equipment (e.g. 3D printers, tablets), as well as through the annual National eTwinning Conferences, which act as hubs for the exchange of good practice and professional networking. Furthermore, articles and studies produced by the action are published in scientific and educational journals, such as eTwinning WELCOME and Learning with Technologies, thereby reinforcing the scientific character of the intervention.

The integration of AI in educational practice through eTwinning

The European Commission has identified the development of emerging technologies, including artificial intelligence (AI), as a strategic priority in the field of education. This domain of innovation is of paramount importance within the field of education, representing a substantial technological advancement. In this context, eTwinning provides online training programmes and specialized in-person events that cultivate digital competencies and advocate for the

[15] https://www.etwinning.gr/news/general/997-etwinning-2
[16] https://etwinning.gr/news/stem

judicious and ethical utilization of AI in pedagogical practice. For instance, the open online course 'The pedagogical use of AI in eTwinning projects and teaching courses' is scheduled to be offered from October 2023 onwards. This 200-hour course, which is delivered over a period of 24 weeks, is designed for teachers of all levels and disciplines. It offers insights into the potential, limitations and ethical considerations of AI in education. The pedagogical approach integrates theoretical instruction with practical application, encompassing subjects such as the creation and management of educational materials, learning assessment, administrative support, and the organization of the teaching process. The course has seen a surge in popularity, with enrolment figures increasing from 2,685 in the 2023–24 academic year to 4,459 in the subsequent 2024–25 academic year. The programme evaluation, which received 1,521 responses, demonstrated a high level of satisfaction. It is noteworthy that 64.4% of teachers assigned the highest rating of "10", while 23.4% allocated a "9". The trainers were held in high esteem with regard to their expertise, guidance and communication skills, and the training material was evaluated as clear, complete and up to date. The activities were found to be appropriate for facilitating understanding of the subject matter, fostering a sense of belonging to a community of practice, and enhancing teaching preparation. Moreover, a significant proportion of the participants reported that their expectations were largely met (Angelopoulos, Paraskevas & Tzimopoulos, 2025).

In response to the mounting interest, eTwinning has made available from May 2025 a new, innovative Massive Open Online Course (MOOC) entitled "Harnessing AI in Education and eTwinning Programmes". The programme encompasses four training cycles, encompassing fundamental concepts, ethical considerations and data protection, the utilization of chatbots and prompt engineering, multimedia applications and content creation with AI, and evaluation, instructional design and ethical issues in practice. The programme places particular emphasis on experiential learning, hands-on activities and the functioning of an active learning community.

In addition to the online activities, the NSO also organizes thematic face-to-face events, such as the multidisciplinary seminar "Applications, Tools and Perspectives of AI in Education", which took place in Patras in May 2024. The seminar, which combined theoretical presentations, workshops and networking activities, provided secondary school teachers with practical skills for integrating AI in collaborative eTwinning projects.

The above-described framework examines the contribution of eTwinning in Greece to the development of a renewed framework for educational practice, grounded in transnational collaboration, experiential training, and the pedagogical integration of emerging technologies. Within this framework, the introduction of Artificial Intelligence (AI) is not conceived as an objective in itself, but rather as a catalyst for the reconfiguration of roles, practices, and learning relationships across the educational community. The eTwinning training activities have been meticulously designed to reflect a balanced integration of theoretical instruction, practical application, and the cultivation of professional identity. The activities under discussion are informed by a number of established theoretical perspectives, most notably those of Wenger (1998) on "communities of practice" and Mezirow (1997) on "transformative learning." The establishment of such a foundation is conducive to the development of a shared pedagogical discourse, thereby enabling educators to transition from the passive utilization of digital tools to an active and reflective engagement with educational innovation. In this respect, eTwinning functions as a dynamic learning ecosystem that interlinks educators, institutions, and technological infrastructures. This ecosystem fosters collective autonomy, professional agency, and adaptability, thereby enhancing the capacity of the teaching community to address the multifaceted challenges of the digital era.

PUBLICATIONS

The enhancement of teachers' professional competencies through eTwinning is bolstered by a variety of dissemination and collaboration initiatives that facilitate the sharing of knowledge, the exchange of best practices, and the cultivation of a collaborative professional culture. Since July 2023, the eTwinning NSO has been publishing an online periodical, WELCOME (etWinning ELeCtrOnic MagazinE) [17], which is issued biannually. This open-access publication functions as a repository of educational practices, empirical findings, and scholarly discourse, intended to reach a diverse readership that includes teachers, researchers, students, pupils, and education professionals. WELCOME functions as a living archive of innovative classroom experiences and research results, facilitating ongoing dialogue and cross-border professional learning.

Furthermore, the eTwinning NSO disseminates Pedagogical Guides and eBooks [18] that compile targeted methodologies and concrete examples drawn from real-world projects. The objective of these publications is to provide teachers with practical guidance and strategies that can be readily implemented in classroom settings. This support is intended to facilitate the translation of digital innovation into everyday instructional practice. Notable exemplars include

[17] https://welcome.etwinning.gr/
[18] https://www.etwinning.gr/etwinning/publications

guides on "Educational robotics in kindergarten with the Bee-Bot," which outline age-appropriate robotics activities, assessment considerations, and classroom management guidelines; compendia such as "e-books of good practice for Skills Workshops," which synthesize effective approaches for developing essential 21st-century competences; and curated collections featuring exemplars from national eTwinning competitions, which showcase innovative pedagogical approaches and project-based learning models.

CONCLUSIONS

The present article examines the transformative role of eTwinning within the Greek educational system, focusing on its impact on teacher professional development and the dissemination of innovative teaching practices. Anchored in a national framework that integrates policy, training, and institutional support, eTwinning has contributed substantially to strengthening teachers' digital and collaborative competencies while fostering a culture of pedagogical innovation.

At the systemic level, the network has expanded its reach to a significant number of active teachers and educational institutions, facilitating the implementation of a large body of collaborative projects. Training programmes constitute a central component of this transformation, combining theoretical concepts with practical application through Open Online Courses and Massive Open Online Courses (MOOCs). Evidence derived from systematic evaluation reveals both quantifiable improvement in digital skills and a consistently high level of participant satisfaction with the quality and effectiveness of the learning interventions. The integration of STEM education, supported by the provision of equipment, training manuals, and practical teaching scenarios, has led to the establishment of a coherent ecosystem that connects technological resources with innovative pedagogical approaches.

The incorporation of Artificial Intelligence (AI) into the educational agenda further illustrates the system's adaptability to emerging technological needs. Specialized courses, thematic MOOCs, and face-to-face seminars provide teachers with both theoretical insights and practical skills for the responsible application of AI in the classroom. However, this integration is not without challenges. Disparities between educational institutions - particularly in remote or under-resourced areas- highlight persistent inequalities in access to equipment and reliable digital infrastructure. The Panhellenic School Network has played a critical role in addressing these gaps, providing technical support and promoting infrastructure enhancement in order to mitigate the digital divide. Beyond technical constraints, the development of teacher competencies remains paramount. Many educators employ ICT tools in a limited or instrumental fashion, a tendency linked to gaps in initial and continuous professional training. In addition, concerns regarding data protection, ethical use, and the potential for technological substitution contribute to a degree of skepticism among practitioners. To counter these challenges, eTwinning and related initiatives of the Ministry of Education implement an integrated training model that combines open online courses, experiential workshops, and learning communities. This model not only equips educators with critical competencies but also fosters confidence, thereby reframing ICT and AI from perceived threats into catalysts for pedagogical enhancement.

A further dimension of the strategy is the systematic recognition of innovative practices through national and European competitions, quality labels, and dissemination platforms. These mechanisms incentivize excellence while fostering a culture of sharing and replication of good practices. Strategic partnerships with the Greek Universities, the Institute of Educational Policy (IEP), the State Scholarships Foundation (IKY), and other public training structures extend the impact of eTwinning by establishing strong linkages between national policy, higher education, and European programmes.

In conclusion, the Greek eTwinning framework represents a robust model of synergy between policy, institutional structures, and professional development initiatives. It demonstrates the capacity to promote innovation in educational practice while equipping educators with the competencies necessary for the 21st century. To ensure sustainability and further scalability, the following measures are proposed: (a) the consolidation and expansion of resources for training and digital infrastructure, (b) the systematic integration of eTwinning into both initial teacher education and in-service training standards, (c) the implementation of longitudinal evaluation studies to assess its impact on student learning outcomes, and (d) the reinforcement of thematic interventions in STEM and AI with particular emphasis on ethics, credibility, and classroom applicability. Collectively, these measures will consolidate eTwinning's transformative role in Greek education and strengthen its contribution to European educational policy and practice.

ABSTRACT

This study focuses on assessing the "temperature" of Human Rights within the educational community, aiming to evaluate the climate in relation to human rights and the implementation of the principles outlined in the Universal Declaration of Human Rights. The objective is to highlight the importance of equality, safety, and the protection of students' rights. The methodology used involves a Google Forms questionnaire based on 25 critical statements directly related to human rights, such as safety, equal access to education, participation in democratic processes, and freedom of expression. The questions evaluate the application of these rights in everyday school life, using a scale from 1 to 4 to provide a quantitative estimate of the state of human rights. The questionnaire was distributed via participants' emails and school websites, ensuring broad accessibility.

A total of 235 students from four schools participated in the evaluation: the 1st General High School of Preveza, the Evening Vocational High School of Preveza, the 1st Vocational High School of Karpathos, and the 1st Vocational High School of Heraklion, Crete. The goal was to conduct a comprehensive review of the perceptions and experiences within the school community. Excel was used to process the responses, extract statistical conclusions, and create charts to visualize the results. The evaluation process aimed to document the prevailing climate and analyze areas that may require improvement. Particular emphasis was placed on identifying areas of discrimination based on gender, race, physical and intellectual ability, as well as on issues related to student and school community participation in decision-making processes. A significant goal was to ensure equal access to education for all members of the community and to combat inequality and discrimination.

The assessment of the Human Rights "Temperature" was combined with the use of modern digital tools, which enhanced participation and collaboration among students, teachers, and others. The digital tools used included computers, tablets, mobile phones, projectors, and the internet. Online meetings were organized via Zoom to discuss the results and exchange views. Challenges related to the use of digital media in the educational process were also acknowledged. The study highlighted the need for measures to protect personal data and privacy within the educational community. The findings suggest that the "Temperature" of Human Rights can be improved through continued education and the implementation of strategies that promote equality and acceptance of diversity. At the same time, the integration of digital tools into the educational process not only increased student participation but also strengthened communication and transparency within the community. Google Docs was used to draft a digital report of the research findings, ensuring immediate access for all participants from the four schools. PowerPoint was also used to create an interactive presentation of the report's key points.

In conclusion, the study demonstrates the need for a comprehensive approach that combines the evaluation of human rights with the application of strategies and digital tools. It emphasizes the importance of ongoing efforts to promote social justice, solidarity, and respect for human rights within the educational community.

Keywords: Human rights, educational community, digital media.

INTRODUCTION: THEORITICAL FOUNDATIONS AND THE IMPORTANCE OF HUMAN RIGHTS EDUCATION

Human rights education constitutes a fundamental pillar of modern society and democratic values, as it integrates principles such as equality, dignity, and freedom (Tibbitts, 2017). Its significance goes beyond the transmission of knowledge, as it highlights the human being as an end in themselves, with inalienable rights and responsibilities. The concept of the social contract reminds us that society is based on mutual agreements that promote peace, cooperation, and mutual respect (Banks, 2015). On a pedagogical level, the program is based on constructivism, emphasizing interactive learning, active student participation, and the formation of knowledge through social interaction (Dewey, 1938). Learning becomes a dynamic process of meaning-making, grounded in experience and critical thinking (Freire, 1970). Thus, human rights education takes on an experiential character, cultivating cognitive, social, and moral skills essential for the development of responsible citizens (UNESCO, 2015). The school, as a microcosm of society, is an ideal space for applying these principles. Students are not limited to a theoretical understanding of concepts such as freedom or equality, but experience them in their daily school life. The school becomes a safe environment where these values are discussed, creatively questioned, and established as life-long attitudes (Council of Europe, 2010). The collaboration of schools from different geographical and cultural regions—such as Preveza, Karpathos, and Heraklion—enhances the intercultural dimension of the program and fosters the acceptance of diversity (Banks, 2015). In summary, human rights education in schools, through modern theoretical and pedagogical approaches, constitutes an essential institution for cultivating a society founded on respect, equality, and freedom, shaping active and responsible citizens (Tibbitts, 2017).

DESIGN AND PEDAGOGICAL METHODOLOGY

SCIENTIFIC JUSTIFICATION OF THE DESIGN

Effective human rights education requires a carefully designed and well-documented framework, grounded in scientific data and methodologies. The methodological mapping of students' and educators' knowledge, attitudes, and practices is the first and essential step, as it allows for an accurate assessment of the initial state regarding the understanding and application of human rights principles within the school environment. To achieve this goal, a 25-question survey was used, designed based on internationally recognized research standards and adapted to the specific needs of the educational context (Tibbitts, 2017). The questions cover key thematic areas, such as students' and teachers' understanding of human rights concepts, assessing their level of awareness and sensitivity toward human rights and their significance (UNESCO, 2015). Additionally, perceptions of school bullying are examined—an important social issue directly related to human rights, particularly the right to safety and dignity (Council of Europe, 2010). The survey also explores participation in social actions, reflecting the degree of active citizenship and the willingness to engage in collective efforts to promote social justice (Banks, 2015). Finally, attitudes toward diversity are assessed, focusing on the acceptance and respect of cultural, religious, and individual differences (Freire, 1970). Furthermore, the data collection method combines both quantitative and qualitative techniques, thereby ensuring a comprehensive and multidimensional understanding of the school climate. Specifically: a) Quantitative approach: Through the use of Google Forms questionnaires, data were collected from a large number of participants, allowing for statistical processing. This method enables the rapid and accurate identification of trends and patterns, and also allows for comparisons between different groups or schools b) Qualitative approach: Discussions conducted via video conferencing platforms (such as Zoom) allowed for a deeper analysis of participants' attitudes and perceptions through open dialogue and the exchange of experiences. In addition, the creation of YouTube videos offered a creative and experiential means of expression, enhancing students' active participation and empathy, while also developing multimedia communication skills.

USE OF DIGITAL TOOLS

Access to information through digital media is immediate and wide-reaching. Students are able to gather data from a variety of sources, compare different perspectives, and stay informed about current human rights issues on a global scale (Livingstone, 2018). Connecting school knowledge with social reality and current phenomena makes the learning process more relevant and experiential. At the same time, digital technology facilitates multimedia learning. Through videos, podcasts, interactive games, and virtual tours, students engage with human rights concepts via diverse forms of information tailored to different learning styles. This multimodal approach enhances understanding and deepens knowledge, as students participate actively and experience learning in a dynamic, rich environment (Duke, 2019).

Moreover, the use of digital tools enhances networking and interaction among students from different geographical areas, as seen in the collaboration between schools in Preveza, Karpathos, and Heraklion. Through video conferencing platforms, online forums, and joint digital projects, students learn to communicate, collaborate, and exchange ideas with peers from different cultural backgrounds (Council of Europe, 2018). This intercultural interaction

fosters empathy, openness, and respect for diversity—fundamental values for the promotion of human rights (Kerr & Cermak, 2020).

In summary, the integration of digital media into human rights education—when carried out strategically and coherently—strengthens access to information, supports multimedia learning, and promotes intercultural collaboration. However, in order for technology to function as a bridge rather than a barrier, constant vigilance and action are required to address digital inequality, ensuring educational equity and social justice (Livingstone, 2018).

HUMAN RIGHTS AND COLLABORATIVE LEARNING IN THE CONTEMPORARY SCHOOL

STATISTICAL ANALYSIS AND EDUCATIONAL OBSERVATIONS

The analysis of the statistical data gathered from the questionnaire provides important insights into the school climate and students' attitudes toward human rights, highlighting both the successes and limitations of the educational program. The average class "temperature" of 76–80/100 clearly indicates a positive climate. Students generally demonstrate a favorable attitude toward human rights issues, suggesting that the program and related educational activities have succeeded in raising a significant level of awareness. However, the failure to reach the highest possible score reveals that full engagement or integration of these principles into students' daily experiences has not yet been achieved.

The variation in responses between the participating schools underscores the significant influence of the local sociocultural context in shaping attitudes and perceptions. Cultural particularities, economic conditions, and the broader social environment act as key factors that affect awareness and acceptance of human rights values. For instance, schools located in more open and diverse social environments show greater acceptance and active involvement in human rights activities, while those in more homogeneous or insular communities demonstrate hesitation or limited engagement.

One of the most critical findings from the data is the gap between theoretical knowledge and practical application of human rights. Although students understand what human rights are and recognize their importance, this knowledge has not yet been sufficiently translated into daily attitudes and actions. This phenomenon is typical in many educational efforts where theory remains disconnected from students' lived experiences.

The causes of this gap are complex and multifaceted. They may include a lack of opportunities for genuine implementation and student involvement in practical initiatives and social engagement, as well as an educational context that often emphasizes memorization over critical thinking and active participation. Additionally, the lack of consistent support and reinforcement from the surrounding community—such as families and local social structures—limits the internalization of these rights.

The results suggest the need to strengthen the practical dimension of human rights education through experiential activities, social participation programs, and the promotion of critical thinking. Only through active engagement and involvement in real-life situations can students transform knowledge into a life stance and responsible behavior. Finally, the statistical analysis points to the importance of developing targeted educational interventions that take into account local specificities and needs, as well as promoting partnerships between schools and civil society organizations.

PEDAGOGICAL INTERPRETATIONS: THE SCHOOL AS A MICRO-SOCIETY AND THE THREE DIMENSIONS OF HUMAN RIGHTS EDUCATION

The school represents a microcosm of broader society. As such, it is not merely a space for the transmission of knowledge but also a vital environment for social learning and engagement (Banks, 2015). Educational reality shows that issues such as school bullying, managing diversity (cultural, racial, religious, or ability-related), and students' active participation are not just theoretical concepts—they are daily challenges that demand immediate and experiential responses (UNESCO, 2015). Often, a disconnect is observed between the knowledge students acquire in class and their ability to apply it in practice. This gap confirms that human rights education cannot be confined to the simple transmission of information (Tibbitts, 2017).

Students do not simply seek to be informed about their rights; they primarily aim to gain the motivation and tools necessary to claim and defend them (Kerr & Cermak, 2020). Empowerment is a key element, involving the development of self-confidence, autonomy, and responsibility (Livingstone, 2018).

To achieve this, human rights education must incorporate and balance three interconnected dimensions:

a) Cognitive Dimension

This dimension includes knowledge about what human rights are, their history, the institutions that protect them, and the concepts of equality, freedom, and justice. The cognitive aspect provides the theoretical foundation students need to understand the value and importance of these rights (Council of Europe, 2018). However, this knowledge is neither static nor detached from social reality. It must be shaped through dialogue, critical thinking, and reflection, so that students do not merely memorize rules but grasp the complex and sometimes contested aspects of human rights in practice (Duke, 2019).

b) Emotional Dimension

Acquiring knowledge alone is not enough unless it is accompanied by internalization of the values underpinning human rights: respect for dignity, solidarity, tolerance, and justice (Banks, 2015). This emotional dimension cultivates empathy and awareness of the impact our actions have on others. Education must serve as a space where students experience these values through interactions, discussions, and collaborative processes, helping them develop attitudes that lead to active and responsible social participation (UNESCO, 2015).

c) Practical Dimension

The third—and perhaps most critical—dimension involves the development of skills that allow the practical application of human rights. These include communication and dialogue skills, critical thinking and analysis, conflict resolution and diversity management abilities, active participation in initiatives, collaboration, and teamwork (Tibbitts, 2017). Acquiring these skills equips students to move from being passive recipients of information to becoming active agents of change, both within the school and in the broader society (Kerr & Cermak, 2020).

In conclusion, human rights education must be approached as a holistic process that integrates these three levels, which are mutually reinforcing. Recognizing the school as a micro-society calls for the creation of an environment in which students can live, question, reflect upon, and act upon the values and principles of human rights—thus nurturing not only knowledge but also consciousness and action. This requires shifts both in educational culture and in everyday school practices, where the teacher acts more as a facilitator and motivator than merely a transmitter of information.

COLLABORATION BETWEEN TEACHERS AND STUDENTS: ROLE, APPROACH AND OUTCOMES

The success of any educational initiative related to human rights depends significantly on the dynamic collaboration between teachers and students. In this context, teachers go beyond the traditional role of instructors and actively take on the roles of facilitators, motivators, and co-learners in the educational process.

THE ROLE OF TEACHERS AS FACILITATORS AND MOTIVATORS

Teachers play a critical mediating role between students and the complex content of human rights education. Through targeted questions, guiding interventions, and the encouragement of dialogue, they create a safe and inclusive environment where each student can express their views, share experiences, and voice concerns. This approach allows stereotypes to be deconstructed, multiple perspectives to emerge, and critical thinking to be strengthened. The teacher acts as a catalyst, stimulating inquiry and engagement rather than simply delivering ready-made answers.

INVOLVEMENT IN CHARITABLE AND SOCIAL ACTIONS: THE PARTICIPAL APPLICATION OF SOLIDARITITY

Student participation in practical initiatives, such as charitable activities or social campaigns, highlights education as a living act of social responsibility and solidarity. Through these experiences, students understand human rights not merely as individual entitlements, but as shared responsibilities and collective action.

Participation in such initiatives enhances:
A sense of belonging and community,
An understanding of the connection between individual rights and the common good,
A willingness to take active steps in defending the rights of others.

This collective responsibility nurtures the active citizen—someone who sees themselves as part of a broader social network, with interdependent rights and obligations.

In conclusion the collaboration between teachers and students—through the adoption of the facilitator role by educators, interdisciplinary approaches, and practical engagement in social action—highlights a pedagogy that fosters not only knowledge but also awareness, values, and agency. This holistic cooperation lays the groundwork for a human rights education that is vibrant, meaningful, and transformative for both the school and society at large.

EDUCATIONAL BENEFITS

Human rights education, as implemented through this program, highlighted significant pedagogical values and yielded positive outcomes both in terms of knowledge acquisition and the development of attitudes and skills.

- **Fostering a Democratic Culture and Critical Thinking**

The experiential and interdisciplinary approach contributed to the development of a democratic culture within the school community. Students were encouraged to freely express their opinions, listen to diverse perspectives, and develop critical thinking regarding social issues, moving away from rote memorization.

- **Enhancing Autonomy and Social Responsibility**

Through social initiatives and collaborative efforts, students took an active role in defending and promoting human rights, strengthening their sense of personal and collective responsibility. This participatory educational process promotes autonomy and cultivates the active citizen identity.

- **Opportunity for Intercultural Learning and Acceptance of Diversity**

The collaboration between schools from different geographic and cultural areas (Preveza, Karpathos, Heraklion) sparked meaningful dialogue among cultures and perspectives, fostering mutual understanding, respect, and the acceptance of cultural diversity.

CHALLENGES AND LIMITATIONS

Despite the notable benefits, several challenges emerged that need to be addressed to further improve the program.

- **Digital Inequality**

While the use of digital tools offers multidimensional opportunities for learning and collaboration, significant barriers arise due to digital inequality. The lack of adequate equipment (e.g., computers, tablets) and limited or non-existent internet access in some regions reduces equal access to educational resources. This exclusion hinders the effectiveness of instruction and risks deepening existing social inequalities.

- **Time Constraints in the Curriculum**

Integrating human rights education into an already overloaded curriculum presents problems regarding available instructional time. Additional content and experiential activities require time that is often unavailable, making it difficult to explore topics in depth. As a result, education may remain superficial and fail to achieve its full pedagogical potential.

- **Need for Teacher Training and Support**

Teachers involved in human rights education require continuous professional development and support. The multifaceted nature of the topic, the need for pedagogical skills in handling sensitive issues, and the integration of digital tools demand specialized training, which is not always adequately or systematically provided. Moreover, psychological support and networking opportunities with fellow educators can enhance the quality and effectiveness of teaching.

FUTURE PROPOSALS

Based on the above findings, a series of targeted interventions are proposed:

1. Strengthening Digital Infrastructure

Promote policies that ensure equal access to digital tools for all students through funding programs and technical support. Additionally, develop user-friendly and low-cost digital applications tailored to the needs of schools with limited resources.

2. Curriculum Revision

Integrate human rights education as a cross-curricular and continuous action throughout the school year, with flexible planning that allows for in-depth exploration of topics without overburdening the timetable.

3. Systematic Training and Support for Teachers

Organize seminars, workshops, and networking events focusing both on pedagogical approaches and psychological support for educators. At the same time, create platforms for the exchange of best practices and innovative teaching methods.

4. Promotion of Multicultural and Collaborative Activities

Strengthen intercultural collaboration and active participation through joint projects among schools, social organizations, and local institutions, fostering a meaningful culture of solidarity and collective responsibility.

RECOMMEDATION FOR ENHANCING HUMAN RIGHTS EDUCATION

The establishment of a permanent, organized network of schools collaborating on human rights issues could serve as a hub of innovation, experience-sharing, and good practices. Such a network would enable ongoing dialogue and knowledge exchange through regular meetings and collaborative activities, while also encouraging inter-school events and awareness campaigns that promote collective responsibility (UNESCO, 2015). Furthermore, the intercultural cooperation that arises from the involvement of schools from different regions enriches the educational process and advances the acceptance of diversity (Council of Europe, 2018).

Integrating human rights education into the official curriculum is a fundamental requirement for the sustainability and serious implementation of this subject. Systematic teaching and an interdisciplinary approach through subjects such as History and Social Studies facilitate holistic understanding and ensure the necessary resources and time for effective implementation (Tibbitts, 2017).

Cooperation with NGOs and other institutions offers opportunities for experiential learning, allowing students to engage directly with social issues and enhance their social awareness and active participation (Duke, 2019). Additionally, the development of professional development programs for teachers is crucial for the quality delivery of human rights education, promoting both theoretical understanding and pedagogical skills (Kerr & Cermak, 2020).

Lastly, the use of technological tools supports communication, progress monitoring, and cross-disciplinary collaboration, making learning more engaging and effective through multimedia content and digital platforms (Livingstone, 2018).

CONCLUSIONS

Human rights education is not merely an additional educational activity or a theoretical subject, but a fundamental component in shaping contemporary society. Through innovative, interdisciplinary, and technology-supported approaches, the program "The Climate of Human Rights" highlights the need for a holistic educational experience—one that goes beyond knowledge transmission and focuses on active participation, critical thinking, and the development of responsible citizens.

The use of technology as a tool for learning and collaboration offers the potential to overcome geographical, cultural, and social boundaries, creating a truly intercultural and polyphonic framework. This contributes to fostering solidarity and acceptance of diversity, which are essential pillars of democratic coexistence. At the same time, the interdisciplinary approach—bringing together educators from diverse academic fields (Chemistry, Economics, Electrical Engineering, Nursing, Philology, etc.)—enhances students' understanding of human rights from multiple perspectives. It broadens their horizons and highlights the complex nature of social issues.

However, to achieve the high aims of such education, the active support of all stakeholders is essential: educators, school administrations, families, and the state. The official integration of the program into school curricula, continuous teacher training, provision of necessary infrastructure, and the creation of permanent networks of collaboration are prerequisites not only for its survival but for the meaningful establishment of human rights education.

Finally, the program's ongoing feedback and evaluation—with the participation of all involved—will ensure its adaptation to evolving social needs and will enhance its effectiveness. This form of education is not simply an investment in the future of students but in the future of society as a whole—a society in which equality, freedom, and dignity play a central role in daily life and in our collective choices.

ABSTRACT

The present study will focus on how the recently unified platform, ESEP (European School Education Platform), can serve as a means for promoting, developing, and cultivating the digital skills of members of the educational community.

The European School Education Platform (ESEP) is the meeting point for the educational community across Europe, including school staff, students, researchers, and policymakers. The platform also hosts eTwinning, the online community for schools in Europe. The benefits for educators are numerous. It aims at their professional development by providing access to a variety of continuous professional development courses, both online and in person, allowing teachers to enhance their skills and stay informed about the latest educational practices. It offers networking opportunities through the eTwinning community, where educators can connect, collaborate, and share ideas with colleagues from all over Europe, fostering a culture of shared learning and innovation. Lastly, it contributes to resource sharing, as it provides a rich repository of teaching materials and resources, enabling educators to access and contribute content that supports effective teaching strategies.

Similarly, the platform fosters collaborative learning among students. Through their participation in eTwinning projects, ESEP allows students to engage in joint projects with peers from different countries, promoting cultural exchange and teamwork. Additionally, it enhances digital literacy by involving students in activities that help them develop essential digital skills through the use of various online tools and platforms for learning and collaboration. Students can also obtain certificates recognizing their participation and achievements, boosting their motivation and enriching their educational profiles.

The ESEP platform has a significant impact on the educational community, strengthening the connections and collaboration between educators and students at the European level. By participating in programs such as eTwinning, teachers gain access to innovative teaching practices, while students familiarize themselves with modern technological tools, simultaneously developing communication and teamwork skills. Moreover, the platform facilitates the exchange of educational materials and best practices, supporting the continuous professional development of educators and promoting lifelong learning. Through these capabilities, ESEP plays a crucial role in shaping a unified and dynamic European educational space, where knowledge and innovation are shared and utilized for the benefit of all community members.

Despite its advantages, the use of the ESEP platform also comes with challenges. One of the main issues users face is the need to become familiar with the platform's environment, as time and training are required for its full utilization. Additionally, unequal access to technology and digital skills may pose a barrier for some educators and students, limiting their participation in available activities. Language differences can also create challenges, as communication and collaboration among users from different countries require sufficient language proficiency. Despite these difficulties, the continuous development and adaptation of the platform, along with the support provided to users, can help address these challenges, ensuring that ESEP remains a valuable resource for the European educational community.

This study will emphasize on the cultivation of digital skills, particularly through the description of specific projects in which teachers and students from the 4th Junior High School of Preveza participate during the implementation of eTwinning and Erasmus+ projects.

Keywords: ESEP, digital skills, educators, students, eTwinning, Erasmus+

INTRODUCTION

In an increasingly digital world, education systems are challenged to adapt and integrate technology in meaningful ways. The European School Education Platform (ESEP), developed by the European Commission, represents a significant step toward the modernization of European education by providing tools, resources, and networks that empower both educators and learners. This paper explores the potential of ESEP to cultivate digital skills through professional development, collaborative projects, and student-centered learning activities. It also presents concrete examples from the 4o Gymnasio Prevezas, which has implemented successful Erasmus+ and eTwinning projects that exemplify the platform's transformative impact. eTwinning is an action within the Erasmus+ program, through which European schools collaborate using ICT (Information and Communication Technologies) in order to gain pedagogical, social, and cultural benefits.

To participate in this action, a school must be registered on the ESEP platform (https://school-education.ec.europa.eu/en). It provides opportunities to create or join an eTwinning project and offers free online training for teachers on pedagogical topics or ICT-related issues. It also promotes participation in working groups with similar or related specialties and awards quality labels that reflect the high standard of a project's activities. The goal is full and systematic collaboration between schools at all levels (students, teachers, classrooms, and school leadership). The initiative seeks educational partnerships in which a large number of teachers, principals, and support staff are involved in a multi-level activity. The aim is for educational staff and students to collaborate on a wide range of topics, such as curriculum subjects or issues related to the professional development of teachers. The main objectives of the action are summarized as follows:1. To develop a common European identity through collaborative activities using ICT. 2. To experiment with new technologies and innovative teaching methods in order to improve the academic and psychosocial development of students. 3. To provide online teacher training that promotes both formal and informal learning. This is implemented through a series of online seminars (Learning Events - L.E.) aimed at integrating innovative pedagogical approaches and fostering professional development (Greek Support Service, Central Support Service, 2016). Common educational management practices are thus identified, including topics such as: a) the benefits of conducting a collaborative European project for students and teachers, b) the use of ICT in the classroom with analyses of shared ideas and methods c) outcomes of collaboration, d) influence of collaborative projects on curricula, and e) practical issues arising in eTwinning projects (Crawley et al., 2010). Pedagogical issues are explored with the ultimate goal of helping educators integrate eTwinning into their daily classroom practice. Educators also find a source of informal learning, search for partners for collaboration through the Partner Finding Forum, or attend events that offer a wide range of opportunities for online professional development at the European level for all community members (Gilleran & Kearney, 2014).

Erasmus+ on the other hand is the EU Programme addressing the fields of education, training, youth, and sport. Its main pillars are high-quality and inclusive education and training, as well as informal and non-formal learning. Essentially, it equips young people and participants of all ages with the qualifications and skills needed for meaningful participation in democratic society, intercultural understanding, and successful transition to the labor market. It strengthens its efforts to increase the opportunities available to more participants and a broader range of organizations, focusing on qualitative impact and contributing to more cohesive societies that are more environmentally oriented and better digitally prepared. European citizens must increasingly possess the knowledge, skills, and competences required in a rapidly evolving society that is becoming more mobile, multicultural, and digital. The programme can significantly contribute to fostering innovation and bridging the gap in knowledge, skills, and competences that Europe faces. It does so by investing in those very attributes, benefitting individuals, institutions, organizations, and society as a whole—supporting sustainable development and ensuring equality, prosperity, and social inclusion (Erasmus+ Programme Guide, 2025).

Since one of its core objectives is to promote learning mobility of individuals and groups, as well as cooperation, quality, inclusion, and equity in the field of education and training, it funds teacher mobility and the creation of partnerships among educational institutions across all levels.
Mobility aims to strengthen the European dimension and improve the quality of teaching and learning, contributing to the creation of a European Education Area through the development of schools' capacity to participate in cross-border exchanges and collaboration, and to implement high-quality mobility projects.

THE EUROPEAN SCHOOL EDUCATION PLATFORM (ESEP): VISION AND COMPONENT

The ESEP acts as a centralized portal for school education stakeholders across Europe. It provides access to Erasmus+ tools, professional development courses, eTwinning projects, and a repository of teaching resources. By promoting digital transformation, inclusion, and sustainability, ESEP aligns with key European Union priorities such as the Digital Education Action Plan 2021–2027 (European Commission, 2020). Teachers benefit from professional

development opportunities, while students engage in authentic, cross-cultural learning experiences. It facilitates the digital competence of educators by offering webinars, MOOCs, and collaborative project tools. The eTwinning component, in particular, enhances professional growth through peer-to-peer collaboration and access to innovative digital pedagogies (Redecker, 2017; Vuorikari et al., 2015). The DigCompEdu framework further supports educators in self-assessing and advancing their digital teaching practices (Redecker, 2017).

Student Empowerment is promoted and enhanced through Collaborative Projects as students participating in ESEP projects develop digital literacy, communication, and problem-solving skills. The platform supports the integration of project-based learning with real-world challenges, fostering engagement and motivation. eTwinning and Erasmus+ projects, when combined, offer a rich context for students to apply digital tools, collaborate internationally, and understand the cultural and societal aspects of European identity (Kampylis et al., 2015).

OBJECTIVES AND PRIORITIES IN ERASMUS+- SYNERGIES WITH ETWINNING

The goal for the 2021–2027 period is to fund ten million mobility projects.
Most of the funding will be directed toward schools that demonstrate a clear intention to develop their international capabilities and participate continuously in European projects. The Four Horizontal Priorities of Erasmus+ programme are:

- Inclusion and diversity
- Digital transformation
- Environment and combating climate change
- Participation in democratic life, shared values, and civic engagement

In School Education and Erasmus+ the Key **Action 1 –** promotes Individual Mobility. This funding opportunity was created for individual schools or organizations. Schools can also form a consortium to share project management efforts and create new synergies.Key Action 1 (KA1) offers training opportunities for school education staff at the European level (IKY, 2023). Through mobility, educators have the chance to receive professional training either by teaching at a partner school abroad, attending training seminars abroad, or participating in job shadowing experiences.Each project may last 1 or 2 years. The project's duration and activities must be clearly defined in the project approval submission.

To be approved, a project is evaluated based on its relevance to the action's objectives, the needs it seeks to meet, the learning outcomes it aims to provide, and the international dimension it adds to the organization. All of these must be clearly articulated, including the means and methods for assessing impact and disseminating results. **Key Action 1 Includes: KA121 projects**, which are accredited mobility projects for students and staff and **KA122 projects**, which are short-term mobility projects for students and staff

The Erasmus+ Accreditation is a certification tool for School Education organizations that, through their application, demonstrate their intention to participate in quality cross-border mobilities under Key Action 1 of the Erasmus+ Programme (2021–2027).

Erasmus+ Accreditation allows organizations and schools to regularly receive funding for mobility activities throughout the entire 2021–2027 programming period. Although accredited Erasmus+ organizations must apply for funding each year, their accreditation for quality-related matters ensures guaranteed funding and more simplified application procedures. It is important to note that an organization or school is **not required to have prior experience** with the Erasmus+ programme to apply for accreditation.

There are two types of Erasmus+ Accreditation application, individual accreditation for organizations, or for accreditation as a Mobility Consortium Coordinator.. A school only needs to receive accreditation **once every seven years**. This is sufficient for the National Agency to recognize the school as an organization regularly engaged in international mobility. Therefore, a school that obtains accreditation does not need to apply for it again within the 2021–2027 Programme period.

There is also **Key Action 2 (KA2)**, the cooperation Partnerships. These are collaboration projects between organizations aimed at: a) Gaining experience in international and transnational cooperation, b) Internationalizing the activities of the participating organizations, c) Developing and strengthening networks, d) Enhancing the capacities of the participating organizations, e) Exchanging practices, methods, ideas, and experiences at the European level, f) Implementing joint actions and initiatives, g) Producing high-quality and innovative results, h) Developing, transferring, and applying innovative practices. In this action there are Forms of Cooperation. More specifically, there are two distinct

forms of Cooperation Partnerships: a) Cooperation Partnerships (KA220) and b) Small-Scale Partnerships (KA210). Each project must contribute — through its results — to achieving at least one horizontal European priority from the following:- Inclusion and diversity in the fields of education, training, youth, and sport, Environment and combating climate change, Digital transformation, through the development of digital readiness/resilience/skills, Common values, civic engagement, and participation. One sector-specific priority, relevant to the field under which the application is submitted and in which the greatest impact is expected.

eTwinning serves as a privileged environment for implementing an Erasmus+ project, as it is a key quality assessment criterion for Erasmus+ Key Action 1 and 2 projects. Schools and teachers are encouraged to participate in the eTwinning platform, as proposed partnership projects under Erasmus+ are evaluated positively if they incorporate digital tools—especially eTwinning (Erasmus+ Programme Guide, 2025). The Case study of the projects implanted by the 4o Gymasio Prevezas that follows is going to show how the 2 programs correlate and promote in enhancing the digital skills of pupils and teachers.

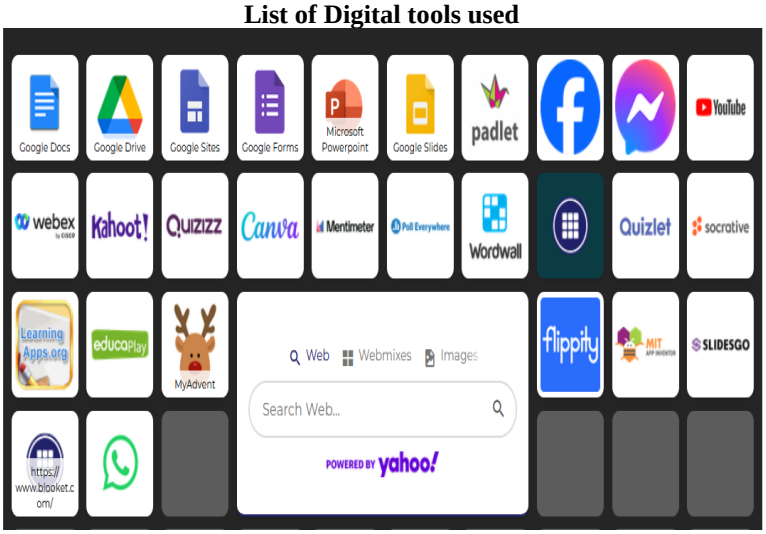
CASE STUDY: ETWINNING AND ERASMUS+ PROJECTS AT THE 4O GYMNASIO PREVEZAS

The 4o Gymnasio Prevezas (Junior High School, age range: 12-15) has implemented two key Erasmus+ projects that align with ESEP's vision: **S.T.I.C.K Together Project (STEM, Technology, Inclusion, Cooperation, Kindness) and Citizens Without Borders (C.W.B.) Project,** which have started both being implemented in October 2025 and throughout the current School Year 2025-26.

The S.T.I.C.K. is a KA1 Erasmus Accredited Project, in collaboration with a partner school in Zagreb, Croatia and emphasized on the integration of STEM education with inclusive values. Teachers and students engaged in workshops and training that focued on digital tools, inclusive education strategies, and cooperative learning. The project enhanced both the technological and interpersonal skills of participants, demonstrating how Erasmus+ mobility can lead to holistic educational development.

For that programme an eTwinning homonymous project was created and published on the ESEP platform(https://school-education.ec.europa.eu/en/etwinning/projects/stick-together-stem-technology-inclusion-cooperation-kindness/twinspace). Therefore, the twinspace of this etwinning project was the space to develop all the activities, to register all teacher and pupils as members and start collaborating on the commonly planned parts and missions of the two partner schools. The use of web 2.0 tools were the key element to safeguard the interdependent character of the activities and the shared vision as far as the goals of the project was concerned. The project focused on using technology to foster inclusion, cooperation, and kindness, encouraging participants to work together to solve real-world problems. By embracing diversity and developing digital skills, the project aimed to create a supportive and innovative learning environment for all students. The wide range of activities included among others: 1. school presentations and member introductions in terms of personal details and get to know each other activities, as well as descriptions of school and local surroundings with the aid of digital tools and AI tools, 2. Logo Competition, 3. The creation of Virtual Escape Rooms, 4. STEM Quizzes, 5. The creation of S.T.I.C.K. Together Advent Christmas Calendar, celebrating International days or weeks such, Code week and Europe/eTwinning Day and of course many on the field person to person activities during the mobilities.

Image 1
The project Logo



The objectives were met through well-structured and varied activities designed to build empathy, teamwork, and digital skills. The combination of online collaboration and in-person exchanges provided both continuity and impact. Students were actively involved in all stages of the project, from planning to presentation. Evaluation included student feedback (pre survey, post survey), reflection activities, teacher observations, and analysis of the quality of collaborative work. Feedback from students after mobility experiences showed high levels of motivation, personal growth, and enthusiasm for future international cooperation.

The project was shared with the wider school community through presentations, the school website, noticeboards, and local events. TwinSpace served as the central hub for documentation and dissemination, allowing students, teachers, and external visitors to access the outcomes. Articles about the project were published in both Greek and Croatian educational portals. It was presented at parental meetings and in front of the school boards. It was continuously documented on school websites and social media.

The final products apart of all digital PPTs and videos that were uploaded on the twinspace also included a cultural collaborative online board game using everything the Students had learned during the project and the mobilities about each other's country. Each team of students made action cards on the board game and students tested their knowledge by playing it . Very important were also the creation of digital applications via STEM during the workshops and the waypupils wre trained not only to use but also to create their own digital Content .

Image 2
List of Digital tools used

Pupils participated in various interactive activities such as coding, digital creativity, environmental awareness tasks, and anti-bullying campaigns. A highlight of the project was the implementation of two short-term mobilities: one hosted in Zagreb, Croatia, and another in Preveza, Greece, where students and teachers engaged in joint workshops, school visits, and cultural exchanges, fostering deeper international friendships and collaboration. The project significantly enhanced students' technological, linguistic, and interpersonal skills in a real-world context. Outcomes included the creation of collaborative digital content, increased student motivation and confidence, development of digital literacy and English language skills, and participation in mobility programmes. Students were empowered to work in teams, express their ideas, and share their cultural identity with their peers from another coutnry.

Collaboration between partner schools took place both virtually and in person. Online meetings, collaborative digital tools (such as Padlet, Canva, and Google tools), and TwinSpace forums were used to plan and carry out activities. Students worked together to solve problems, create multimedia content, and participate in shared challenges. ESEP platform was the greatest facilitator towards that direction as all the virtual part of the project implementation was safegurded by the most secure space for teachrs and pupils in Europe to comminicate and collaborate. The in-person mobilities in Zagreb and Preveza further strengthened this cooperation, allowing students to engage face-to-face in interdisciplinary workshops, STEM experiments, cultural activities, and school visits.

The C.W.B. (Citizens without Borders) is on the other hand **a KA2 Erasmus+ partnership** involving schools from Cyprus (Limassol), Italy (Latina), Sweden (Stockholm), and Greece (Preveza). It consists of four mobility packages, each addressing key themes of digital transformation, environmental sustainability, and European citizenship. It

emphasizes the need to prepare future generations for rapid global changes by promoting awareness of technological, social, cultural, and environmental issues. The main goals are: 1. Citizenship & Inclusion: Helping students to become responsible European and global citizens by understanding European values, cultural diversity, inclusion, and sustainability through collaboration with peers from diverse backgrounds. 2. Digital Competence: Enhance students' digital skills by engaging them in using digital tools and platforms for communication, collaboration, and cultural exploration, aligning with the priority of digitalisation. And 3. Environmental Sustainability: Raise awareness about climate change, sustainable tourism, and eco-friendly practices to foster responsible behavior and equip students with problem-solving and critical thinking skills for green job opportunities. All three goals align with the general plan of the School, the 4ο Gymnasio Prevezas, as expressed in the long – term planning and organization so as it to be a modern, European –oriented, Sustainable democratic School aiming at enhancing life skills of teachers and pupils but at the same time taking care of their welfare and respecting the local – regional – National-European- global environment.

For that purpose, when the project was finally accepted to be granted with the Cypriot School as Coordinator the first school year 2025-26 included 2 packages /mobilities to be enforced and the corresponding etwinning Project with the same name to be created on the ESEP platform (https://school-education.ec.europa.eu/en/etwinning/projects/cwb-citizens-without-borders/twinspace). Each school at the beginning of the school year formed an Erasmus Club, including a pedagogical team of teachers in different disciplines related to the objectives of our project. Some of the criteria for the selection of the teachers were:-Interest in the project topic "EU citizen – Global citizen" -Linguistic competence in English (to be able to communicate with other participants) -Active interest and involvement in school events -Basic computer skills -Digital skills -Gender equality -Teachers with special difficulties, such as Health problems were encouraged to take part and not excluded. The packages/ Activities were planned before the final granting, during the previous years so all the school members had to be organized according to that.

The first one had to be carried by the Coordinating Institution, the Tsireio Gymansio of Limassol, with the general title 'EU+ Digitalization' aiming at the first horizontal priority of the project which is the digital transformation. Therefore, we started our journey as EU-Global citizens by learning through workshops and lectures about digitalizations, what digital tools will be used for the project and how. At the same time we needed to ensure our EU-Global citizens understand the meaning of European citizenship and the importance of sustainability in environment and culture. So the first meeting in Limassol, was to learn basic skills for the completion of the project. The activities were divided in two categories a) digitalisation and cultural heritage and the following set of activities was followed:

- Ice breaking activities
- Revision of tasks and responsibilities
- Logo contest results

Image 3
The winning Logo of the Project

- Workshops on eTwinning, digital tools for dissemination, cultural heritage digitalization, and inclusion.
- Visits to local historical sites such as the ancient city of Kourion providing practical experiences with QR codes and other digital means of preserving culture.
- Students workshop: "connect the dots" - Explore Europe's diversity and discover differences and similarities between their cultures in order to find the common link
- A meeting with a Eurodesk official to talk about the opportunities EU provides to young people
- Visiting CUT to attend lectures and workshops on digitalisation in cultural heritage
- Experiencing first-hand sustainability in culture by a guided tour at the archaeological museum in Nicosia
- Workshop on inclusion and diversity at the Ledra street checkpoint "Unite the divided capital of Europe with words of kindness and peace"
- Meeting Evaluation by teacher and pupils

The Outcomes of the set of implemented activities were that students developed foundational digital skills, cultural awareness, and an understanding of European citizenship and sustainability focusing the SDGs 10, 11, 16.

The second package/ mobility took place in Latina, Italy and was coordinated by the Italian partner School, Liceo Scientifico Statale "E.Majorana" under the general title " Eco-Cultural Herit@ge + Climate Change". The Activity mainly focused on the project's priority: Environment, protection and Climate Change, and Training, and spesifically on the SDGs 3, 11, 12, 13, 14, 15, 17, aligning with the institution's goals of environmental sustainability awareness. All activities aimed at showcasing the natural beauty of the places we visited while emphasizing the impacts of climate change on both land and water life. They included:

- Lab workshops related to 'Algae Biotec 2030', fostering interdisciplinary connections.
- Teachers' CLIL workshops focusing on lesson plan creation, facilitated by experts from our Education Department.
- Study visit of the Lake of Fogliano, being trained how environmental protection is adopted by presentations, visits to the museum, and a tour of the hospital to observe the care of injured animals. Participants delved into exploring sustainable solutions to preserve the ecosystem amidst the challenges of climate change.
- Study visit to the Garden of Ninfa to observe firsthand the effects of climate change on plants, highlighting the diverse impacts of climate change.
- Exploring local agriculture to identify sustainable food sources and connect them to global sustainability efforts.
- Reflecting on their experiences the participants will contribute to reports to be published on the project blog.
- Rome's cultural sites exploration, setting the Coliseum, as a study case, delving into historical preservation methods against the backdrop of climate change Evaluation of the work done.

The Outcomes of the whole package was for Students to gain hands-on experience in climate science and sustainability, improving digital storytelling through blog posts, and being engaged in interdisciplinary learning (SDGs 3, 11, 12, 13, 14, 15, 17).

DEVELOPING DIGITAL SKILLS VIA THE ESEP

As it has already been stated and presented the virtual space that the platform of ESEP is offering to not only the above but also all Erasmus/eTwinning projects is of unquestioned importance and value. All teachers and pupils learn how to use the etwinning platform and start working in a project collaborating and making use of all its tools needed for presentations, or dissemination, understanding the importance of digitalisation in our times and gaining knowledge of how digitalisation can contribute to a sustainable cultural heritage. They will also gain a grasp idea of their European identity, learn the values of EU in order to become a European citizen exchanging cultural elements, learning about the differences and similarities of European countries and finding their common link and understanding the importance of inclusion and acceptance, peace and freedom.

As technology was essential in both projects the students used digital platforms such as the Twinspace, and different digital tools like Canva, Padlet, Genially and Google slides to co-create content. During mobilities, they explored educational technologies such as micro:bit and 3D modeling tools and robotics in joint workshops. Online meetings and forums enabled real-time communication and planning among schools. E-Safety was also a consistent priority throughout the project. All participating students had parental permission for online participation and the use of photographs and videos for dissemination purposes. Teachers guided students on using copyright-free materials and citing sources appropriately. TwinSpace and ESEP consequently provided a safe, password-protected environment where all shared

content was monitored and secure. Also, the issues was further explored on the occasion of the Safer Internet Day where students created a collaborative poster about internet safety.

CHALLENGES IN UTILIZING THE PLATFORM

Despite its benefits, ESEP usage is not without challenges. Educators must invest time to become proficient with the platform's interface and tools. Unequal access to technology and the digital divisions among schools can limit participation. Language barriers and differing curricular systems across countries may also impede collaboration (Bocconi et al., 2016). Nevertheless, continuous platform improvements and institutional support have mitigated many of these challenges.

Despite its pivotal role in fostering cross-border collaboration, the ESEP platform presents certain challenges that can hinder its full potential. One of the main obstacles lies in the platform's navigation and technical complexity, especially for educators or students with limited prior experience in digital tools. For instance, during the implementation of both the S.T.I.C.K. Together and Citizens Without Borders projects, teachers had to dedicate considerable time to registering participants, managing multiple tools within TwinSpace, and ensuring digital safety compliance—all tasks that required significant technical fluency and coordination. Moreover, the integration of diverse digital tools (e.g., Padlet, Canva, Google Suite) outside the platform itself often required additional training and troubleshooting. Language limitations and uneven digital literacy among partner schools further complicated consistent communication and content sharing. These technical and logistical barriers highlight the need for ongoing training, improved user support, and greater platform flexibility to ensure equitable participation for all schools across Europe.

CONCLUSION

The European School Education Platform is a pivotal instrument in the digital transformation of education in Europe. It empowers educators and students alike by offering tools for professional growth, collaborative projects, and intercultural understanding. The 4o Gymnasio Prevezas participation in the "S.T.I.C.K Together" and "Citizens Without Borders" projects illustrates the platform's real-world impact on digital skill development. By fostering inclusive, innovative, and sustainable educational practices, ESEP significantly contributes to a unified and forward-looking European educational space. Despite its challenges, the ESEP platform has proven to be an invaluable tool for enhancing the digital competencies of both teachers and students. Through the eTwinning projects linked to S.T.I.C.K. Together and Citizens Without Borders, the platform offered a secure, collaborative environment where educational communities could interact, co-create, and innovate. Pupils developed essential digital skills by designing multimedia content, engaging in virtual meetings, creating online board games, and even building their own digital applications during STEM workshops. Teachers, on the other hand, strengthened their capacity to integrate digital pedagogy, manage international project coordination, and use collaborative tools effectively. The structured yet adaptable format of TwinSpace encouraged active participation, creativity, and cultural exchange, turning digital literacy into a real-life experience. As a result, the ESEP platform not only supported the technical execution of Erasmus+ projects but also played a key role in transforming the digital culture of the school community—empowering educators and learners alike to thrive in a connected, globalised world.

ABSTRACT

This paper presents an innovative educational project that integrates digital tools to promote multiliteracies and experiential learning. Focusing on the cultural and environmental connections between Thessaloniki and Constantinople, the project centers around the Sustainable Development Goals 14 (Life Below Water), 15 (Life on Land), and 17 (Partnerships for the Goals). Using ArcGIS software, students created an interactive map that traces a land-and-sea route highlighting key cultural, historical, and ecological sites. Through this process, they developed digital literacy, environmental awareness, and cultural sensitivity. The program enhanced students' critical thinking and collaborative skills while fostering active citizenship and interdisciplinary understanding. ArcGIS enabled the combination of geospatial data processing with creative expression, supporting an integrated approach to education. Ultimately, the project demonstrates how the synergy of technology, culture, and environmental education can foster sustainability and cooperation. The student-created digital map serves as both a learning artifact and a public invitation to explore the shared heritage and future of these two historic cities.

Keywords: digital media, multiliteracies, ArcGIS, interactive map, critical thinking.

INTRODUCTION

In an era defined by global connectivity and digital transformation, education is increasingly called upon to reimagine learning through new literacies and technologies. This paper presents an educational initiative titled *Mapping Culture and Environment: A Digital Educational Odyssey,* which integrates digital mapping, environmental and cultural literacy, and student-led inquiry using the ArcGIS platform. Rooted in the principles of multiliteracies and experiential learning, the program connects the cities of Thessaloniki and Constantinople through an interactive digital journey—bridging land, sea, history, and sustainability.

The transition to a post-industrial, information-based society marked by digital communication has brought to the forefront new forms of literacy that go beyond traditional reading and writing. Within this context, the concept of multiliteracies, first introduced by the New London Group (1996), reflects the complex and multimodal communication needs of today's youth and society at large. Multiliteracies encompass the understanding and creation of meaning through various semiotic modes—linguistic, visual, auditory, and digital—and are closely tied to the development of critical thinking, creativity, and active participation (Kalantzis & Cope, 2023).

Educational practice today is called to respond to these shifts by bridging theoretical knowledge with experiential, collaborative, and authentic learning experiences (Hallström, 2023). At the same time, contemporary education faces the challenge of cultivating 21st-century skills (Partnership for 21st Century Skills – P21, 2011), such as communication, collaboration, problem-solving, digital fluency, and information management. The development of such skills requires the integration of multiliteracies into the curriculum, not merely to acquire knowledge, but to foster the ability to apply it in complex, real-world learning environments (P21, 2011; Larson & Miller, 2011). As Laurillard (2008) emphasizes, technology is transforming both the content and process of learning. This transformation demands that students develop the capacity to search, organize, evaluate, and communicate information in a critical and creative manner. Within this framework, multiliteracies serve not only as a gateway to knowledge but also as a tool for empowering learners—enhancing their learning identity, self-expression, and social awareness.

The educational program presented in this paper applies these concepts in practice, offering a model for how digital media and geographic information systems can cultivate interdisciplinary learning across environmental, historical, and cultural domains. It demonstrates how students, by mapping a symbolic journey between Thessaloniki and Constantinople, can engage critically and creatively with their world while acquiring the skills to shape a sustainable future.

METHODOLOGY

At the core of this educational program was the use of ArcGIS, a geographic information system (GIS) software, which enabled students to design and construct an interactive digital map. Maps have long served as powerful storytelling tools, capturing the imagination and transmitting knowledge about the world. Historically, they documented the journeys of missionaries, diplomats, and merchants, blending factual geography with elements of wonder and myth. From medieval maps that intertwined cosmology and theology to narrative accounts of leaders' travels, cartography has always been a medium for both information and interpretation. In the digital age, mapping has evolved through technologies such as Geographic Information Systems (GIS), web-based platforms, and mobile applications. These tools enable users to visualize complex data, trace patterns and routes, illustrate change over time, and support decision-making processes. Today, maps do more than describe the world—they interpret it, offering dynamic ways to understand spatial relationships, cultural contexts, and global phenomena (Marta & Osso, 2015; Param, 2024). This map visualized a symbolic route across land and sea, connecting Thessaloniki and Constantinople—two cities with deep historical, cultural, and geographical ties. The mapping process functioned as a digital narrative that integrated multiple forms of data and perspectives, facilitating a rich, interdisciplinary learning experience.

The methodology was grounded in principles of experiential, inquiry-based, and collaborative learning, combining research, fieldwork, digital cartography, and storytelling (for details about digital narratives see: Koenitz et al., 2015). Students were actively engaged in collecting, organizing, and analyzing information; identifying and mapping key historical, environmental, and cultural landmarks; and narrating the interwoven connections between the two cities. The pedagogical approach deliberately transcended traditional subject boundaries, blending geography, history, environmental education, digital media, and cultural heritage studies.

The project was developed within the framework of the Environmental Education Program titled *"Sea, Land, and People... That Unite Us!"* during the 2024–25 academic year at the Gymnasium. Aimed to:

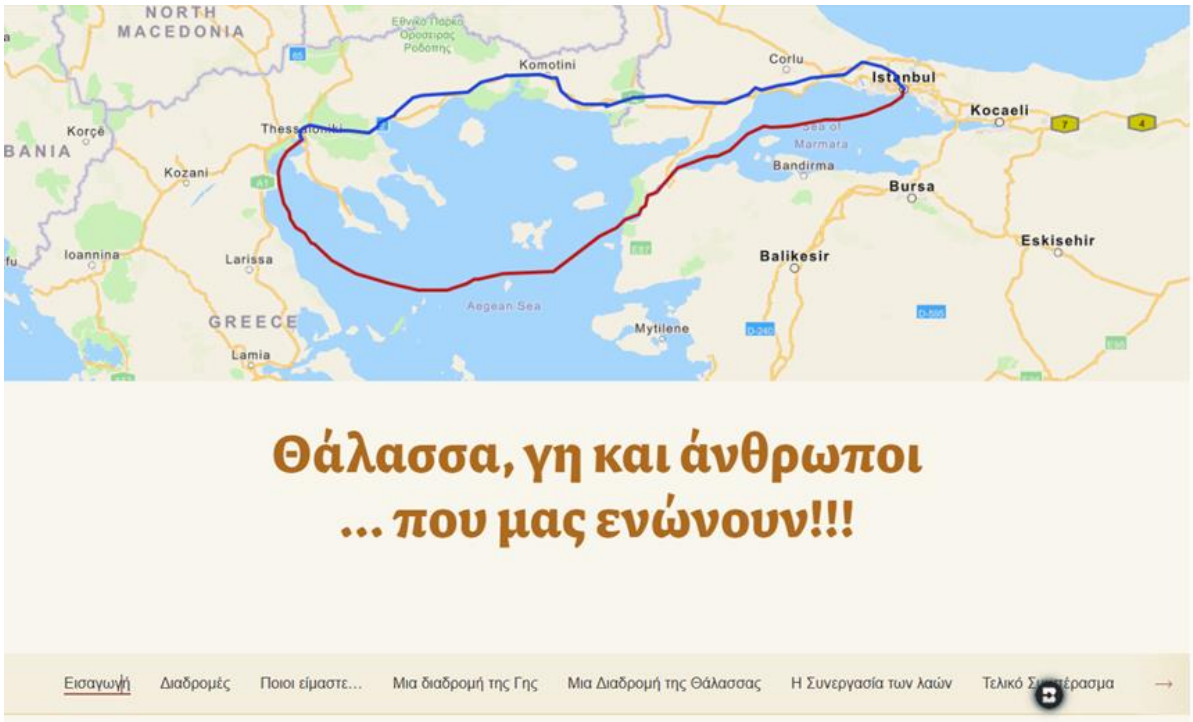
1. Highlight the connection between Thessaloniki and Constantinople, emphasizing historical, cultural, and geographical continuity across time and space.
2. Foster experiential and creative approaches to learning, encouraging students to construct knowledge through direct engagement and creative production.
3. Develop a range of essential 21st-century competencies. including critical thinking, communication, digital fluency, collaboration, and multimodal expression.

Specific Objectives and expected learner's outcomes:

- Promotion of Multiliteracies: the project supported diverse forms of literacy—linguistic, digital, cultural, and environmental—by integrating multiple modes of meaning-making and representation.
- Experiential Learning: students engaged in active inquiry, learning through real-world tasks such as mapping, interviewing, and narrative design, rather than passive content absorption.
- Digital Education: using ArcGIS, students developed technical and conceptual skills in digital mapping, data visualization, and geospatial analysis, bridging theoretical learning with applied practice.
- Environmental and Cultural Awareness: the mapping route served as a lens for exploring the relationship between human societies, cultural identity, and natural ecosystems, highlighting local and regional environmental concerns along with tangible and intangible cultural heritage.
- Interdisciplinary Approach: knowledge from multiple academic domains—History, Geography, Information Technology, and Modern Greek Language—was synthesized into a cohesive educational experience, reinforcing the value of cross-curricular connections.
- Collaborative Learning: students worked in teams, enhancing their abilities to communicate, negotiate, delegate, and co-create content in a shared digital environment.
- Cultivation of Presentation Skills: emphasis was placed on the structured communication of research outcomes, using both oral presentation techniques and multimodal tools, notably the digital map - as platforms for public engagement and reflection.

THEORETICAL FRAMEWORK

The educational project presented in this paper is grounded in two interrelated conceptual foundations: the theory of multiliteracies and the framework of sustainable development as articulated by the United Nations' Sustainable Development Goals (SDGs). Sustainable development refers to the capacity of societies to grow economically, socially, and environmentally in a way that meets the needs of the present generation without compromising the ability of future generations to meet their own needs. At its core lies a balanced integration of the three pillars of sustainability: the economy, the environment, and society. These dimensions must be addressed holistically to ensure long-term well-being and resilience. The United Nations' 2030 Agenda for Sustainable Development, adopted in 2015, defines 17 Sustainable Development Goals (SDGs) that aim to create a more just, inclusive, and sustainable world. These goals emphasize the importance of global cooperation, environmental protection, and social justice, particularly by prioritizing the needs of the most vulnerable populations. The SDGs include targets that address poverty reduction, gender equality, climate action, access to quality education, and ecosystem preservation, among others (United Nations, 2015).



Within this context, education is viewed as a critical enabler of sustainability. It not only imparts knowledge but also fosters the values, skills, and behaviors necessary for responsible global citizenship. The SDGs explicitly highlight the role of education in Goal 4: ensure inclusive and equitable quality education and promote lifelong learning opportunities for all. Furthermore, Goals 14 (Life Below Water), 15 (Life on Land), and 17 (Partnerships for the Goals) are particularly relevant to the educational program discussed in this paper, which explores environmental and cultural connections between Thessaloniki and Constantinople through a digitally mapped learning journey.

This pedagogical approach is further enriched by the lens of multiliteracies, which expands traditional notions of literacy to include diverse forms of meaning-making across linguistic, visual, digital, spatial, and cultural modes (New London Group, 1996). Multiliteracies promote active student engagement with real-world issues, fostering critical thinking, collaboration, and creativity—all of which are essential for addressing the complex challenges of sustainability in the 21st century (Cope & Kalantzis, 2009).

As a practical application of these frameworks, the storymap "Sea, land and people... that unite us!!!" (Image 1) presented in this paper was developed as a project for a school-based Environmental Education Program conducted at the 1st Model Lyceum "Manolis Andronikos", in Thessaloniki, during the academic year 2024–25. This project represents an innovative educational initiative that harnesses digital media to promote multiliteracies and experiential learning. Centred on the connection between Thessaloniki and Constantinople—two cities with profound historical, cultural, and geographical ties—the project engages students in exploring and reflecting upon the SDGs 14 (Life Below Water), 15

(Life on Land), and 17 (Partnerships for the Goals). Through this educational journey, students actively engaged with issues of sustainability, cultural heritage, and cross-border cooperation, creating a meaningful learning experience rooted in real-world contexts.

Image 1
Conference Website Graphic The storymap: Sea, land and people... that unite us!!! (in Greek)

The implementation of multiliteracies in educational settings gains substantial pedagogical value when linked to authentic, experiential, and technology-enhanced practices (Kaufman, 2013). In this project, the creation of a digital storymap served as a dynamic platform for applying the principles of multiliteracies while simultaneously cultivating key competencies as outlined by the Partnership for 21st Century Skills (P21, 2011). The activity did not merely involve content acquisition but encouraged students to act as researchers, storytellers, cartographers, and digital creators, roles that mirror real-world demands in a knowledge-based, multimodal society (Alm, 2024).

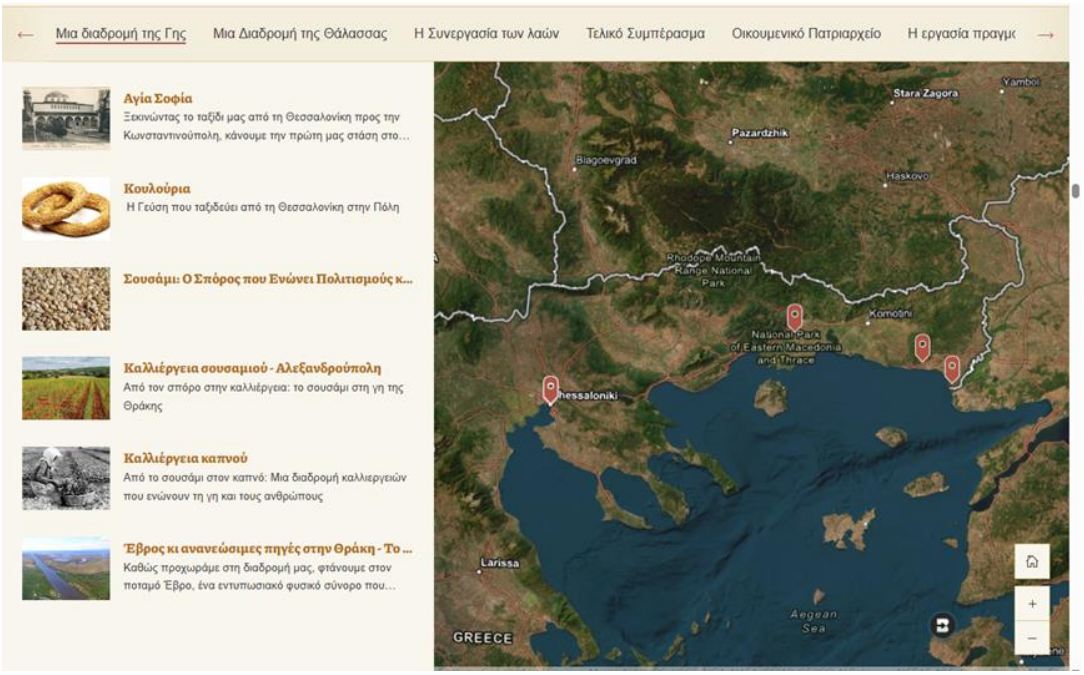
Central keys to the mapping process were critical thinking and problem solving (Voogt & Roblin, 2010). Students were required to gather information from diverse sources—historical texts, environmental data, multimedia content, and local narratives—and evaluate its relevance and reliability. They had to synthesize complex inputs into cohesive and meaningful digital narratives, critically selecting what to include and how to represent it within the broader framework of the Sustainable Development Goals (SDGs). The thematic integration of Goals 14, 15, and 17—related to life below water, life on land, and partnerships—further encouraged them to examine environmental and cultural issues through a critical, interdisciplinary lens.

Communication, as emphasized in multiliteracies theory, involves not just linguistic proficiency but the ability to express ideas through multiple semiotic modes. The storymap required students to design a layered narrative combining text, visuals, geographic data, and digital media (Marta & Osso, 2015). This multimodal literacy was essential in enabling students to articulate their understanding of the cultural and ecological connections between Thessaloniki and Constantinople. The interactive nature of the platform promoted clarity, audience awareness, and aesthetic judgment in communication—core elements of effective 21st century messaging. Collaboration also featured prominently in the learning process (Rotherham & Willingham, 2010). The project was structured as a team-based activity, requiring students to coordinate tasks, negotiate content, and co-construct meaning. They worked together to research locations, design the visual layout, edit narrative sections, and resolve design or data challenges. This cooperative engagement fostered mutual respect, responsibility sharing, and the development of interpersonal communication skills—elements that mirror the collaborative dynamics of contemporary professional environments.

The development of Digital Literacy was both a means and an outcome of the project. Using ArcGIS storymap technology, students learned to navigate digital platforms, manage online resources, and integrate geographic and multimedia data into an interactive interface. They not only consumed digital content but became producers of it, gaining insights into both the opportunities and limitations of digital tools. Their work reflected an increasing awareness of issues such as information credibility, data ethics, and digital citizenship—core components of critical digital literacy. Through the synthesis of multiliteracies and the P21 framework, the storymap became more than a digital artifact—it functioned as a multilayered educational experience. It provided students with the tools to understand, interpret, and reshape their world through active, creative, and critical engagement. The project illustrates how the intersection of multimodal expression, collaborative inquiry, and purposeful technology use can enrich the educational process and prepare learners for the complexities of the 21st century.

IMPLEMENTATION OF THE PROGRAM

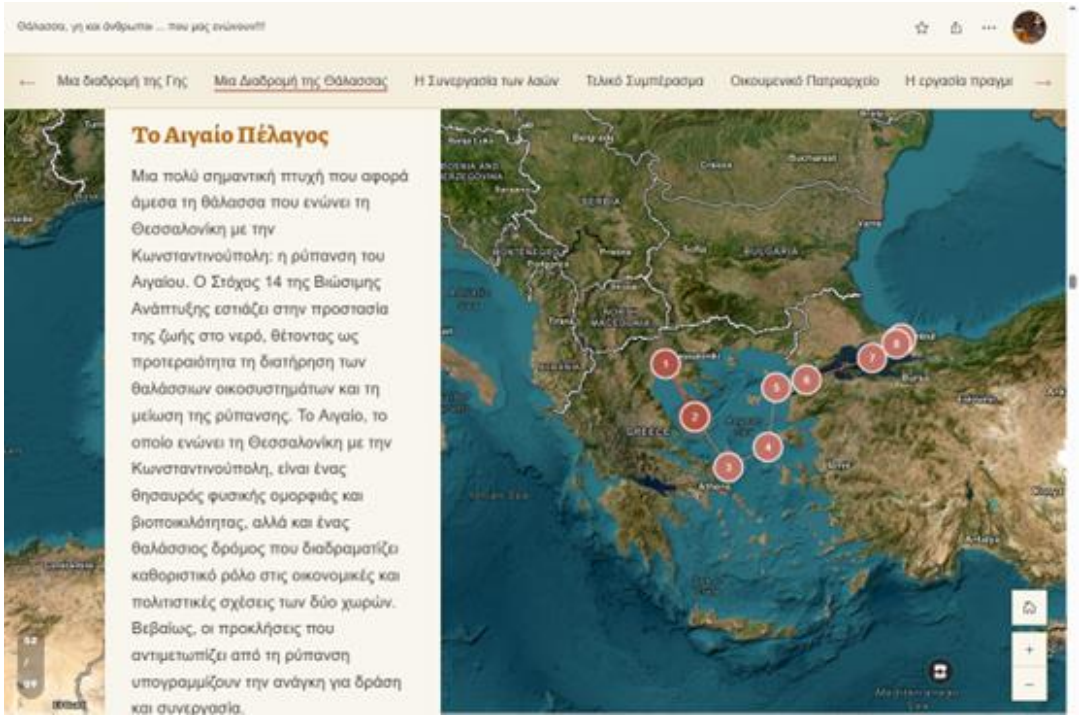
The practical implementation of the educational program centered on the use of ArcGIS technology as a tool for fostering both technical proficiency and creative expression. Students engaged in digital cartography to visualize a symbolic journey connecting Thessaloniki and Constantinople, integrating diverse data sources, narratives, and multimedia elements. This process encouraged metacognitive engagement, as students were required to critically analyze, organize, and communicate complex information through multimodal platforms (Kalantzis & Cope, 2025).



ArcGIS served as a catalyst for interdisciplinary exploration, enabling the synthesis of cultural and environmental themes across different geographical points. The program began in Thessaloniki, with a focus on the Church of Hagia Sophia - a monument that resonates with its namesake in Constantinople, symbolizing spiritual and cultural continuity. Students examined both tangible and intangible heritage, identifying shared symbols, traditions, and practices that connect the two cities. One such example was the investigation into the koulouri (traditional sesame bread) and sesame cultivation, a culinary and agricultural link illustrating the intertwined histories of the regions. The journey then proceeded through Thrace, with educational stops at the Evros River and local renewable energy sites. These locations provided opportunities for students to explore contemporary environmental issues such as biodiversity, climate resilience, and sustainable resource management. By interacting with these real-world contexts, students gained insight into the balance between cultural preservation and ecological responsibility. The destination of the digital narrative was Constantinople, where the Hagia Sophia emerged not only as a historical and religious landmark but also as a powerful metaphor for coexistence and intercultural collaboration. The mapping project thus culminated in a cohesive, student-constructed storyline that bridged the past and present—highlighting the dynamic relationship between cultural identity and environmental stewardship.

Through this process, learners became cartographers of meaning, connecting places, histories, and ecosystems into a shared narrative. The implementation of the program exemplified how digital tools can facilitate meaningful, place-based, and collaborative learning experiences aligned with the goals of sustainable development and 21st-century education.

The thematic route titled *Earth's Path* was designed to explore the intersection of cultural heritage, sustainable agriculture, and gastronomy, with particular reference to Sustainable Development Goal 15: Life on Land. This part of the program focused on how land-based resources, traditional practices, and cultural expressions inform sustainable living and connect communities across borders.

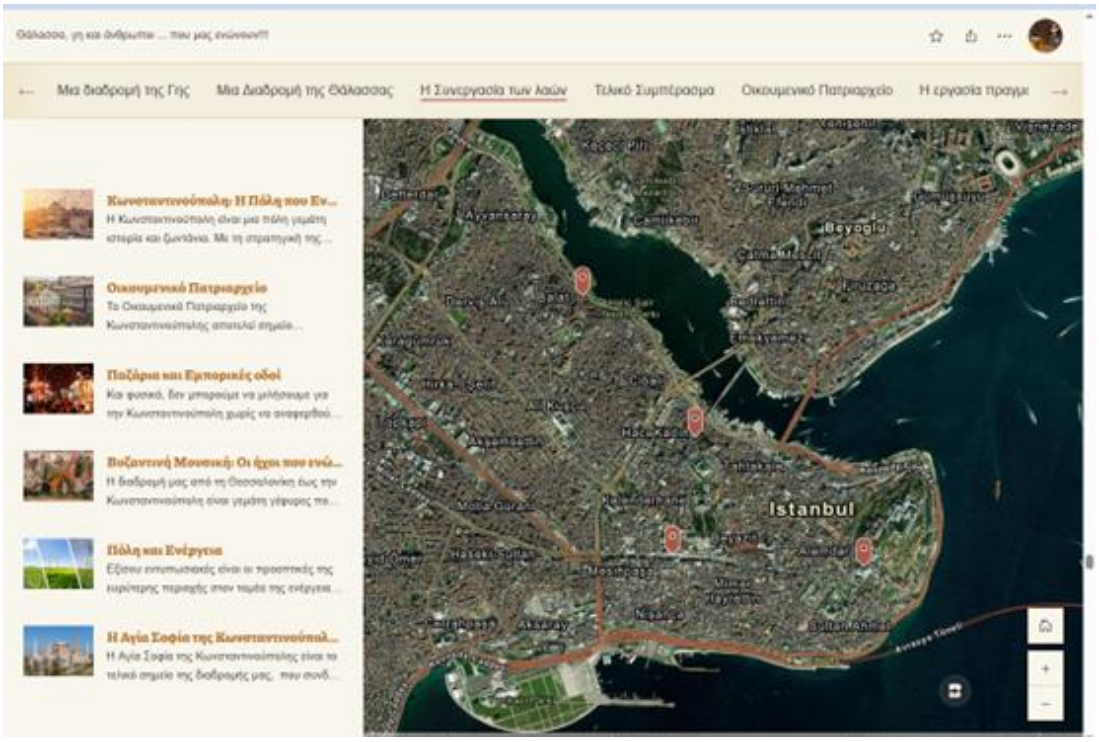


The journey began at the Hagia Sophia of Thessaloniki, a monument of significant cultural and historical importance. As a UNESCO World Heritage Site, it represents the city's Byzantine heritage and spiritual identity. Symbolically, it served as a cultural bridge to its counterpart, the Hagia Sophia in Constantinople, inviting students to reflect on the shared religious, architectural, and historical narratives that unite the two urban centers. This connection emphasized the role of cultural monuments in promoting a sense of continuity, intercultural understanding, and common heritage. Following this, students examined the gastronomic link between Thessaloniki and Constantinople through the iconic koulouri—a circular sesame bread deeply embedded in the culinary traditions of both cities. The exploration highlighted not only the food item's historical evolution and symbolic value but also the agricultural significance of sesame, which is traditionally cultivated in Thrace. Students investigated the socioeconomic and environmental dimensions of sesame production, its role in local ecosystems, and its integration into daily diets across generations. In doing so, they gained an appreciation for how food culture is interwoven with sustainable agricultural practices, biodiversity, and regional identity. These connections also allowed students to reflect on SDG 15 in practical terms, by considering how the protection of natural resources and local food systems supports both cultural preservation and ecological health.

Image 2
Earth's Path: Cultural Heritage and Gastronomy in the Context of SDG 15 (in Greek)

The *Sea Route* (Image 2) of the educational journey was designed to engage students with key environmental and ecological issues aligned with Sustainable Development Goal 14: Life Below Water, focusing on the protection of aquatic ecosystems, the promotion of sustainable practices, and the appreciation of natural resources that transcend national borders. Through this section, students explored how interconnected land and marine environments are vital to biodiversity, regional cooperation, and long-term sustainability.

Εικόνα 3
Sea Route: Sustainable Development Goal 14: Life Below Water (in Greek)



The Evros River, a critical natural boundary between Greece and Turkey, served as a focal point for examining biodiversity in riparian ecosystems. Students studied the river's role as a habitat for numerous plant and animal species, as well as its importance for migratory birds and endemic wildlife. Discussions included threats to freshwater biodiversity, such as pollution, over-extraction of water, and habitat disruption, alongside conservation strategies and cross-border environmental cooperation. This investigation deepened students' understanding of the interdependence between terrestrial and aquatic systems and the need for international collaboration in ecosystem preservation. In the region of Thrace, students explored local installations of wind and solar energy, reflecting on the role of renewable energy sources in addressing environmental challenges. They examined how sustainable energy initiatives contribute to reducing carbon emissions, mitigating climate change, and promoting energy independence at a regional level. Through this analysis, students linked the transition to clean energy with responsible environmental stewardship, thereby integrating the technological and ecological dimensions of sustainability.

The final marine-related focus was on the Aegean and Marmara Seas, where students engaged with issues of marine biodiversity, examining native flora and fauna, food chains, and ecosystem health. Attention was also given to human impacts on marine environments, such as overfishing, plastic pollution, and climate change-induced disruptions. Students reflected on marine conservation strategies, including protected areas and sustainable fishing practices, and discussed the importance of raising awareness about the fragile balance of marine ecosystems. These activities fostered a holistic view of environmental interconnectivity and the urgency of safeguarding marine life in both local and global contexts.

The final stage of the program—both thematically and symbolically—was devoted to Sustainable Development Goal 17: Partnerships for the Goals, emphasizing the importance of cross-border cooperation and collective action in addressing global environmental challenges. By focusing on the cultural and ecological ties between Greece and Turkey, the educational journey encouraged students to reflect on the transformative power of partnerships, dialogue, and shared responsibility.

Image 4
Sustainable Development Goal 17: Partnerships for the Goals (in Greek)

Despite historical and political differences, Greece and Turkey share common environmental concerns, particularly in relation to climate change, marine and air pollution, and urban sustainability. Students explored how these transboundary issues necessitate coordinated responses at both the local and international level. The program fostered an understanding of the interconnectedness of ecosystems and the need for bilateral and multilateral cooperation in ensuring

environmental resilience. To contextualize these challenges, the program introduced students to key international environmental agreements:

- Agenda 21: A comprehensive action plan adopted at the UN Conference on Environment and Development (1992), which promotes sustainable urban development and community participation in decision-making.
- Kyoto Protocol (1997): A binding international treaty obligating participating countries to reduce greenhouse gas emissions, recognizing the disproportionate role of industrialized nations in global warming.
- Paris Agreement (2015): A global commitment to limit the rise in average global temperatures to below 2°C, emphasizing national contributions and collaborative efforts toward climate neutrality.

These agreements were not presented merely as abstract policies, but as living frameworks with direct implications for everyday life and regional cooperation. Students were invited to reflect on how such global initiatives can inspire local engagement, especially among youth.

One of the guiding principles of the program was the idea that informed citizens are empowered citizens. By investigating the causes and consequences of environmental degradation, students developed a nuanced understanding of the ecological crisis and the societal shifts needed to address it. In this light, the educational process became an act of civic empowerment, equipping students with the knowledge, skills, and motivation to participate in sustainable development efforts. The culminating stop is in Constantinople—a city symbolizing historical convergence and modern complexity—served as a metaphorical and educational space for contemplating the potential of intercultural dialogue and collective environmental stewardship. Through this final leg of the journey, students were encouraged to envision a shared ecological future, rooted in mutual respect, cooperation, and sustainable practices.

The culmination of the project involved a series of public presentations and participations in student-centered events that highlighted both the process and the outcomes of the work. These dissemination activities served not only to showcase the students' achievements but also to strengthen their communication, collaboration, and digital presentation skills. The program was presented at the 2nd Student Environmental Conference of the National Educational Action Network *"Constantinople–Thessaloniki: An Educational Coexistence – Citizens of the City, Greeks of the World"* (March 27, 2025). For this presentation, students were actively involved in organizing the content, developing structured arguments, and designing audiovisual materials. Emphasis was placed on the development of public speaking skills, including expressiveness, clarity, and audience engagement.

An important feature of the presentation phase was the rotation of students through different roles, such as presenters, researchers, and technical coordinators. This inclusive approach ensured that all participants had the opportunity to actively engage, fostering social-emotional growth, self-confidence, and equitable development of presentation skills. The preparation process was collaborative, promoting peer interaction, responsibility sharing, and feedback exchange, thus enhancing team cohesion and metacognitive awareness. In addition to the main conference, the project was disseminated through multiple public events and competitions:

- Participation with the poster project "Click to protect what unites us" at the exhibition organized by the regional Environmental Education Network *"Click, Protect it!"* (May 5–15, 2025), where the project received a commendation for Artistic Photography.
- Presentation at the Student Festival of Environmental Education Programs 2024–25, where students shared their work with wider school communities.
- Participation in the 14th Student Festival of Digital Creativity, showcasing the StoryMap and its multimodal features.
- Entry into the national Bravo Schools Competition for Primary and Secondary Education.

Through these diverse forms of dissemination, the students not only communicated their research and creative outputs but also embodied the values of collaboration, cultural awareness, and sustainability, which were at the core of the program.

EDUCATIONAL OUTCOMES

Participation in the program yielded significant educational benefits, equipping students with a wide range of cognitive, digital, interpersonal, and socio-environmental competencies. The design and implementation of the digital storymap offered a rich, interdisciplinary learning experience that aligned with the principles of multiliteracies, experiential learning, and the Sustainable Development Goals (SDGs). Using ArcGIS, students cultivated advanced digital literacy, learning to manage geospatial data and visualize complex ideas through interactive storytelling. This process enhanced their ability to synthesize information from diverse sources, structure digital narratives, and communicate meaning through multimodal formats.

At the same time, the thematic focus on marine and terrestrial ecosystems, cultural heritage, and sustainable development contributed to a deeper understanding of environmental and cultural literacy. Students explored the symbolic and material connections between Thessaloniki and Constantinople, gaining insight into shared traditions, local biodiversity, and the interdependence of human and natural systems. The project fostered essential skills as identified by the Partnership for 21st Century Skills (P21) framework:

- Critical thinking and problem-solving: Students engaged in analytical and creative thinking to structure their map, assess information quality, and make informed content choices.
- Communication: The presentation of their work in diverse formats (oral, visual, digital) enhanced clarity of expression and audience awareness.
- Collaboration: Team-based activities encouraged mutual support, role-sharing, and cooperative problem-solving.
- Digital literacy: Competence with mapping software and online tools empowered students to become confident users and creators in the digital environment.

Additionally, the experiential nature of the project contributed to the development of social-emotional learning and global citizenship. Students practiced peer learning and self-reflection, while the emphasis on cultural contact and environmental responsibility nurtured a sense of identity, empathy, and awareness of global interdependence. Engagement with global frameworks such as the Paris Agreement and the Kyoto Protocol further contextualized their learning within international efforts toward sustainability and cooperation. In sum, the project functioned not only as a platform for content knowledge acquisition, but as a transformative educational experience—one that empowered students to connect knowledge with action, voice with responsibility, and local narratives with global challenges.

CONCLUSION

This project demonstrated the transformative potential of experiential learning when combined with digital technology and sustainability education. By addressing real-world challenges—such as climate change, heritage preservation, and intercultural understanding, the program encouraged students to reflect on their roles as active participants in a globally interconnected society. The final product, an interactive digital map, served not only as a medium for showcasing student research and creativity, but also as a tool for engaging broader audiences. It offered a narrative journey that intertwined historical memory, environmental awareness, and cultural continuity, making visible the symbolic and practical ties between Thessaloniki and Constantinople. The project's interdisciplinary nature—merging history, geography, environmental studies, and digital media—provided a dynamic, learner-centered model of education. It empowered students to move beyond passive reception of information, enabling them to construct, interpret, and present knowledge in meaningful, multimodal ways. Through place-based investigation and digital storytelling, students developed essential 21st-century skills, strengthened their multiliteracies, and deepened their awareness of global interdependence.

In summary, the educational initiative underscores the power of digital media and experiential learning in shaping multidimensional educational experiences. By connecting land, sea, and people, the program bridged historical heritage with contemporary sustainability goals. Students emerged from the process not only with enriched cognitive and technical competencies but also with a renewed sense of personal and collective responsibility toward cultural and environmental stewardship. The Thessaloniki–Constantinople digital mapping project thus stands as a best-practice model for how schools can integrate multiliteracies, sustainability, and digital innovation to foster empathy, cooperation, and critical awareness. Ultimately, it invites educators and learners alike to envision education as a catalyst for connection, transformation, and collective action toward a more just and sustainable future.

TA12: The Internet of Things and education.

THE INTERNET OF THINGS IN EDUCATION: TECHNOLOGICAL APPLICATIONS, PEDAGOGICAL PERSPECTIVES AND ADOPTION CHALLENGES

Giourgas Angelos
University of Ioannina, Department of Informatics and Telecommunications
Postgraduate Student
Preveza, Greece
e-mail: pint00162@uoi.gr

ABSTRACT

This paper investigates the theoretical and technological foundations of the Internet of Things (IoT), as well as the challenges and prospects of its integration into the educational process.

Drawing on current research studies, theoretical frameworks, and empirical data, it examines the architecture and operation of IoT systems in education, and their convergence with emerging technologies such as Artificial Intelligence (AI), Cloud Computing, and Machine Learning (ML).

The study presents key IoT applications in educational settings, including smart classrooms, interactive whiteboards, wearable devices for tracking physiological and learning metrics, and automated platforms for learning analytics. It further discusses how IoT can enhance personalized learning, optimize resource management, and broaden access to educational tools.

A critical evaluation of the benefits and limitations of IoT in education is provided, with particular attention to issues such as data privacy and security, infrastructure costs, and the need for specialized technological training for educators.

Finally, the paper explores future developments in IoT adoption within the educational community, positioning it within a wider technological landscape. The transformative potential of IoT—especially when integrated with Augmented Reality (AR), Virtual Reality (VR), and blockchain—promises the emergence of more intelligent, adaptive, and secure educational environments. The systematic implementation of IoT requires the development of strategic policies, robust ethical and legal frameworks, and the establishment of sustainable technological infrastructures.

Keywords: Internet of things (IoT), smart education, artificial intelligent (AI), machine learning (ML), augmented and virtual reality (AR/VR), Blockchain.

INTRODUCTION

The rapid technological advancements of recent decades have positioned the Internet of Things (IoT) as a key driver in the transformation of social, economic, and educational structures. IoT constitutes a technological ecosystem in which people, sensors, software, and networks collaborate to collect, exchange, and analyze data in real time (Atzori, Iera, & Morabito, 2010). While its applications initially emerged in sectors such as industry and healthcare, IoT has increasingly permeated the field of education, offering new possibilities in teaching practices, assessment methodologies, and institutional management (Al-Fuqaha et al., 2015).

Contemporary educational systems face mounting challenges, including the personalization of learning, the integration of innovative teaching methods, the management of vast data volumes, and the upgrading of technological infrastructure. In this context, IoT emerges as an innovative solution capable of supporting intelligent, dynamically adaptive learning environments (Bandyopadhyay & Sen, 2011). Within a smart classroom, data generated by IoT devices and sensors enables educators to monitor students' learning trajectories, reflect on their pedagogical practices, and implement targeted and personalized instructional interventions (Mishra & Sharma, 2020).

The purpose of this paper is to explore the role and transformative potential of IoT in education by analyzing its technological, pedagogical, and organizational dimensions. Additionally, the study examines the intersection of IoT with cutting-edge technologies such as Artificial Intelligence (AI), Machine Learning (ML), and Cloud Computing (CC), emphasizing their synergistic role in enabling integrated digital learning ecosystems. The paper further presents contemporary applications combining IoT with Augmented Reality (AR) and Virtual Reality (VR) that reshape knowledge acquisition and instructional delivery. A critical review of the benefits and challenges of IoT in educational settings informs policy and practice recommendations for its strategic, pedagogically grounded, and technologically sustainable integration into the modern classroom.

THEORETICAL AND TECHNOLOGICAL FRAMEWORK OF THE INTERNET OF THINGS

The Internet of Things (IoT) is conceptualized as an interconnected technological ecosystem in which physical objects—such as sensors, wearable devices, computers, and other systems—are equipped with embedded circuits, software, and communication capabilities, enabling the autonomous collection and transmission of data without human intervention (Gubbi, Buyya, Marusic, & Palaniswami, 2013). These smart devices form the foundational components of an architecture grounded in constant interconnectivity and information flow, creating a dynamic interactive environment between the physical and digital worlds.

The technological infrastructure of IoT is generally structured across four key layers:

1. Perception Layer: This layer includes sensors and data-gathering devices capable of detecting physical phenomena such as temperature, voice, or motion.
2. Network Layer: Responsible for the transmission of collected data through wired or wireless communication protocols, including Wi-Fi, Zigbee, or 5G.
3. Processing Layer: Involves the storage, analysis, and modeling of the data, transforming raw information into meaningful insights.
4. Application Layer: Pertains to the final use of the processed data, which informs decision-making processes often executed via automation.

The integration of IoT with Artificial Intelligence (AI) and Machine Learning (ML) significantly enhances its functionality—not only enabling data collection but also fostering predictive analytics and autonomous action. The addition of Cloud Computing (CC) offers the required computational power and scalable storage necessary for the uninterrupted and flexible operation of IoT in educational environments (Hashem et al., 2015).

In educational contexts, Constructivism 2.0 and adaptive learning frameworks provide the pedagogical foundation for harnessing IoT technologies effectively. Learning environments supported by IoT promote participatory knowledge construction, real-time data interaction, and personalized instructional flow tailored to the individual needs of each learner (Kafyulilo, 2021). Such environments enable a shift from static to dynamic, data-informed, and student-centered learning models that respond fluidly to context and learner input.

APPLICATIONS OF IoT IN EDUCATION AND THE CLASSROOM

The integration of the Internet of Things (IoT) into the educational process is gradually transforming traditional classrooms into intelligent, interactive, and data-informed learning environments. IoT applications in education support personalized learning, enhance classroom interaction, and improve both instructional efficiency and school infrastructure management.

In smart classrooms, sensors, interactive whiteboards, and monitoring devices are installed to continuously track learning conditions. IoT systems can dynamically regulate lighting, temperature, air quality, and noise levels, adjusting the environment to optimize learning (Zhu et al., 2019). Additionally, solar panels installed on school buildings can power IoT devices and help reduce energy consumption, contributing to sustainable infrastructure. Network-connected tablets and interactive boards offer students customized learning pathways tailored to their individual pace and preferences.

Wearable technologies such as wristbands and smartwatches can collect biometric data—including heart rate, oxygen levels, and stress indicators—enabling real-time monitoring of students' physical and emotional states. This allows educators to intervene when signs of fatigue or learning difficulty emerge, supporting more targeted adaptive learning interventions. Furthermore, IoT-enabled educational platforms collect and analyze usage data from digital tools such as quizzes and learning apps. These data are then used to generate predictive analytics for individual and group performance, improving formative assessment strategies (Siemens & Long, 2011).

The convergence of IoT with Augmented Reality (AR) and Virtual Reality (VR) further enriches educational experiences. For instance, in a biology class, students can use tablets to scan 3D models of the human body embedded with IoT sensors, receiving real-time physiological data and interactive content. In geography, VR headsets combined with IoT-powered simulations allow students to virtually explore a volcano, while sensors simulate realistic seismic activity for immersive learning experiences.

IoT also enhances school safety and access control. With NFC-enabled ID cards, students and teachers can be automatically registered upon entry, allowing for real-time attendance tracking and movement monitoring within the school premises. Access permissions can be configured based on the profile of each user, limiting or granting access to specific areas. Building-integrated IoT sensors can also detect smoke, fire, or unusual movements, and trigger automated emergency responses, such as unlocking doors during evacuation scenarios.

ADVANTAGES OF IoT IN EDUCATION

The integration of the Internet of Things (IoT) into educational contexts introduces significant opportunities to enhance both the quality of teaching and the student learning experience. One of the main advantages is the promotion of personalized learning through the real-time collection of data related to learners' preferences, performance, and learning pace. These data enable the design of tailored learning models, enhancing the effectiveness and autonomy of individual learning pathways (Chen et al., 2020).

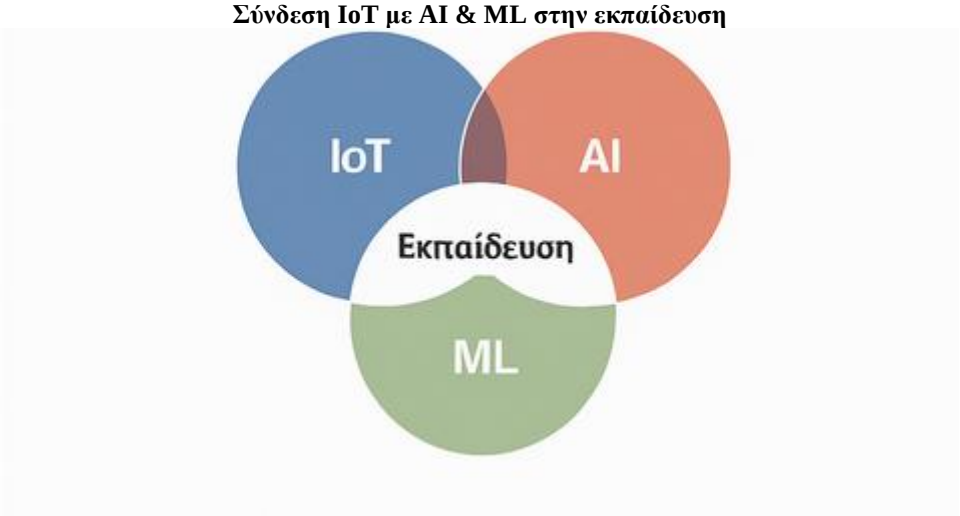
Interactive whiteboards, mobile devices, and monitoring software offer instant feedback to both students and teachers, encouraging self-regulated learning and allowing for immediate instructional intervention. IoT also supports collaborative learning by enabling shared use of connected devices and learning environments, promoting active engagement in exploratory and interdisciplinary activities. Furthermore, IoT facilitates the creation of universally accessible learning experiences, such as assistive devices for hearing or vision impairments, thereby supporting inclusive education.

For students with disabilities or those in remote areas, IoT-enabled technologies make it possible to participate in adaptive, remote learning environments that respond to individual needs and provide real-time instructional content. This contributes to equitable access to education for all learners.

Additionally, IoT aids in the efficient management of school infrastructure, including lighting, heating, and security systems. The use of automation and predictive maintenance improves resource optimization and reduces operational costs, contributing to both economic and ecological sustainability.

INTEGRATION OF IoT WITH ARTIFICIAL INTELLIGENCE (AI), MACHINE LEARNING (ML), AND CLOUD COMPUTING (CC) IN EDUCATION

The convergence of IoT with advanced technologies such as Artificial Intelligence (AI), Machine Learning (ML), and Cloud Computing (CC) represents a strategic innovation with transformative potential for the educational sector (Yin et al., 2021). This integration fosters the development of intelligent, adaptive, and sustainable learning environments, enhancing both instructional quality and administrative efficiency.



AI enhances IoT systems by enabling the processing and interpretation of data collected from sensors and educational platforms. Using machine learning algorithms, it is possible to detect emotional states, stress levels, and concentration patterns in students through biometric sensors (Zhou et al., 2020). AI also supports the development of intelligent digital assistants that facilitate formative assessment, personalized feedback, and automated monitoring of learning progress.

Machine Learning improves the predictive and self-optimizing capabilities of IoT systems. Through supervised and unsupervised learning techniques, it enables the identification of learning patterns, predicts potential academic failure, recognizes individual learning preferences, and helps adaptive systems self-correct and improve (Alenezi et al., 2021). This approach also strengthens the predictive capacity of assessment tools. Data collected from biometric devices can be used to compare with similar cases and guide real-time interventions Furthermore, ML enables the utilization of large datasets gathered from multiple sources such as LMS platforms, wearable devices, and interactive tools, enhancing data-driven decision-making in education.

The integration of cloud computing with IoT provides a scalable and flexible infrastructure for storing and managing data from sensors and educational apps. Cloud services allow centralized storage, remote access, and seamless integration of multiple devices and platforms (Gubbi et al., 2013). They also enhance collaborative learning, ensure interoperability, and support secure data handling—especially critical in hybrid or distance learning settings.

Together, AI, ML, and CC form a dynamic ecosystem that enables smart education. Their integration promotes data-driven personalization, supports informed decision-making at both instructional and administrative levels, and helps embed evidence-based pedagogical practices. Modern trends point toward combining these technologies with immersive environments (AR/VR), resulting in holistic learning scenarios that emphasize sustainability, adaptability, and inclusivity (Fathema et al., 2022).

Σύνδεση IoT με AI & ML στην εκπαίδευση

INTEGRATION OF IoT WITH AR & VR TECHNOLOGIES IN EDUCATIONAL INSTITUTIONS

The convergence of the Internet of Things (IoT) with Augmented Reality (AR) and Virtual Reality (VR) technologies is transforming the educational landscape into a multimodal pedagogical environment that enhances experiential and interactive learning. These technologies, when used complementarily, allow students to be immersed in simulated or enriched learning scenarios, dynamically informed by real-time IoT data.

The incorporation of sensor data—such as from meteorological stations, temperature sensors, and pollution detectors—enables the real-time visualization of information through AR applications. For example, students can observe the development of climatic phenomena over time using AR tools, thereby strengthening the connection between theoretical knowledge and the physical environment (Elmqaddem, 2019). Similarly, VR combined with IoT allows for the creation of adaptive simulations, where environmental variables adjust based on data inputs. In biology classes, for instance, VR models of the human body can respond to the student's heart rate or breathing patterns, collected through wearable sensors, transforming the experience into an interactive learning process (Radianti et al., 2020).

Indicative Pedagogical Scenarios:

- AR + IoT in Environmental Education: Pollution sensors connected to tablets or smart glasses enable students to explore schoolyards or natural ecosystems while viewing augmented information on CO_2 levels, noise pollution, or temperature. AR provides visual overlays on physical objects, enhancing situated learning (Mikropoulos & Natsis, 2011).
- VR + IoT in Technical and Vocational Training: In disciplines such as engineering, students interact with VR simulations of machines or electrical circuits, whose behavior is influenced by real-time sensor data. For example, a virtual engine may alter its operation based on live readings from heat or pressure sensors (Garzón & Acevedo, 2019).

CHALLENGES IN IMPLEMENTING IoT IN EDUCATION

Despite the numerous benefits of integrating IoT into education, several technological, ethical, and organizational challenges must be addressed to ensure its sustainable and pedagogically meaningful application. Understanding these challenges is critical, as they involve both functional aspects of system operation and broader concerns related to ethics, equity, and digital literacy. A primary concern is data privacy and protection. The collection and management of sensitive personal information via smart devices raise ethical and legal questions regarding privacy and data security. IoT environments involve multiple data collection points—sensors, devices, networks—which increase vulnerability to cyberattacks and data breaches (Alsaadi et al., 2020). The absence of a unified regulatory framework further complicates consent, transparency, and accountability, particularly in learning environments involving minors (Zhou et al., 2019).

The deployment of IoT infrastructure requires significant investment in high-speed connectivity, sensors, smart devices, and data platforms. Educational institutions—especially those in rural areas—may face economic and technical limitations that hinder adoption (Avgerou, 2021). Furthermore, the combined use of IoT, AR, and VR calls for not only robust technical infrastructure but also alignment with pedagogical goals. Excessive technological mediation risks cognitive overload and distraction if not embedded in carefully designed instructional frameworks (Merchant et al., 2014).

Long-term sustainability also raises issues of maintenance, interoperability, and cost-effectiveness. The complexity and variety of devices demand ongoing support and integration, making cost amortization a central concern for institutional planning.

The successful integration of IoT requires a well-trained educational workforce capable of embedding technological tools into teaching practices. However, a considerable proportion of teachers show low digital fluency, which slows down the adoption process and undermines the pedagogical value of these technologies (Scherer et al., 2019). Structured professional development programs are essential—not only focusing on technical tool usage but also on aligning technology with learning theories and instructional design.

POLICY AND IMPLEMENTATION PROPOSALS FOR IOT IN EDUCATION

The integration of the Internet of Things (IoT) into education requires a systemic alignment of policy strategy, technological infrastructure, and pedagogical application. The following proposals are structured across macro (national policy), meso (educational institutions and authorities), and micro levels (classroom and teacher), to ensure a sustainable and equitable adoption of IoT in educational environments.

At the macro level, governmental bodies should incorporate IoT into broader digital transformation strategies for education. This includes setting clear objectives, monitoring indicators, and establishing institutional frameworks that promote innovation while safeguarding equity and data protection (European Commission, 2023). National or regional policies on "smart schools" must be backed by adequate funding and support mechanisms.

At the meso level, educational institutions require technical assistance to adopt IoT devices such as sensors, interactive tools, and educational wearables. Furthermore, interoperability across platforms is essential to integrate data from various sources into unified learning management systems (Alenezi, 2022). School administrations must be equipped with evaluation tools to assess these technologies based on pedagogical effectiveness.

The micro-level integration of IoT hinges on the continuous professional development of educators in the following areas:

- Designing pedagogical scenarios that leverage IoT,
- Basic device management and technical troubleshooting,
- Critically interpreting data for differentiated instruction.

Training programs should include experiential workshops and collaborative learning models (UNESCO, 2021).

Implementation policy must also address issues of privacy, consent, and security. The use of IoT in classrooms cannot be viewed as neutral or technocratic, it demands explicit safeguarding of students' personal data and informed engagement of teachers and parents in data practices (Pangrazio & Selwyn, 2019). Appointing a "digital ethics officer" in schools could be a step toward institutionalizing ethical governance.

The development and adoption of IoT solutions should arise from participatory processes, involving teachers, students, parents, and special educators. The focus must extend beyond technological affordances to include pedagogical relevance and educational outcomes (Laurillard, 2012). Educational IoT applications must be continuously evaluated for accessibility, inclusiveness, and alignment with 21st-century skills.

PROSPECTS OF IoT IN EDUCATION

As IoT enables the real-time collection of student performance, behavior, and needs, Artificial Intelligence (AI) technologies can process these data to generate personalized learning profiles. Such profiles enhance the capacity of systems to detect learning difficulties, recommend adaptive teaching scenarios, and support autonomous learning pathways (Chen et al., 2020).

Developments in educational transparency and learning traceability are leading to the integration of IoT with blockchain technologies, which offer secure, verifiable records of learning achievements (Sharples & Domingue, 2016). Simultaneously, the use of IoT data within advanced learning analytics frameworks is poised to transform curriculum design and assessment practices by increasing precision and responsiveness (Ifenthaler & Yau, 2020).

Strengthening partnerships between educational institutions, universities, and technology companies is essential for the sustainable integration of IoT. These cross-sectoral collaborations could include:

- Pilot implementation of IoT projects in schools with technical support from industry,
- Ongoing teacher training based on evidence-informed standards from research institutions,
- Joint innovation initiatives such as smart labs or open data-sharing platforms for educational use,
- Knowledge and best practice transfer from the private and higher education sectors to primary and secondary education (Manca & Ranieri, 2016).

Such initiatives can enhance schools' digital autonomy and ensure that technological innovation is embedded in a holistic strategy for educational reform rather than applied in a fragmented manner.

Future developments demand not only technological progress but also ethical and legal frameworks that guarantee privacy, informed consent, and fairness in data use. Moreover, there is a growing need to revisit pedagogical theories, integrating concepts such as "learning through augmented perception systems" and "dialogical interaction with intelligent environments" (Luckin, 2018).

CONCLUSIONS

Εικόνα 2
Το IoT δεν είναι το μέλλον της εκπαίδευσης. Είναι το παρόν.
Πηγή εικόνας: https://englishpluspodcast.com

This study highlights the critical role of IoT as a catalyst for educational innovation. The use of smart devices and sensors enhances teaching efficiency, facilitates personalized learning, and enables accurate tracking of student progress. IoT is not the future of education — it is the present. Many educators already incorporate advanced technologies in their daily practices, both to facilitate their instructional tasks and to foster interactive learning experiences for students.

In conclusion, the Internet of Things (IoT) emerges as a pivotal component in the evolving landscape of digital education, offering the potential for more personalized, adaptive, and data-informed teaching and learning practices. However, its effective integration extends beyond technological affordances; it necessitates coherent policy strategies, institutional support, pedagogical recontextualization, and ethically grounded design. The role of the educator remains central—not merely as a facilitator of learning, but as a custodian of values, ethics, and the social dimensions of education. Thus, the use of IoT in educational contexts should not be perceived as a replacement for human agency, but rather as a means of enhancing pedagogical practice within a cohesive and human-centered digital ecosystem.

ABSTRACT

The rapid advancement of artificial intelligence (AI) and its integration into education create new opportunities for teaching natural sciences, offering dynamic tools that enhance the learning process. This study explores the use of ChatGPT as a support tool for teaching the age of the Earth in secondary education. Specifically, it presents a teaching scenario that combines active inquiry, collaborative learning, and critical thinking, enabling students to interact with ChatGPT for searching, processing, and evaluating scientific information.

The methodology is based on a blended learning model, which combines traditional teaching with technology. In this approach, students formulate questions, analyze responses, and compare ChatGPT's information with established scientific sources. Additionally, the study investigates the challenges associated with AI use in education, such as the need for digital literacy, information reliability, and the role of teachers as mediators in the learning process. The proposed teaching scenario consists of three parts: 1. Introductory teaching, where fundamental concepts about the age of the Earth and scientific dating methods are presented. 2. Interaction with ChatGPT, where students organized into groups, pose questions, search for answers, and evaluate the information received. 3. Evaluation and feedback to compare learning progress and explore students' experience of using the tool.

The quantitative analysis of the research is based on the following data collection tools: Pre-test and post-test, measuring students' cognitive development before and after using ChatGPT. Likert-scale questionnaires to capture students' experience and their perception of the reliability and usefulness of such tools. Statistical data analysis, extracting conclusions about the effectiveness of integrating ChatGPT into teaching practices.

It was concluded that the use of ChatGPT enhanced learning engagement, encouraged an enquiry approach and the development of students' critical thinking. Through statistical analysis of the data, it was concluded that it improved the cognitive level and the degree of understanding of the concepts. However, it highlights the need for appropriate pedagogical guidance and educational policy to ensure the proper use of such AI tools in the educational process.

Keywords: Artificial Intelligence, Education 4.0, ChatGPT, Age of the Earth

INTRODUCTION

In 2001 in Germany, the term Industry 4.0 was coined to describe the context of the changes and transformations that occurred in industry in the mid-1990s and characterizes what we now call the 4th industrial revolution (Hermann et al., 2016).About a decade later, the first references to the concept of Education 4.0 as a process of transformation of education due to this technological development began (González, 2010). However, the first systematic researches started only in 2017 considering Education 4.0 as the tool to address the requirements set by Industry 4.0 i.e. the need to prepare the workforce for the new technological challenges arising from the use of digital technology and the new production methods of the now 'smart' factories (Ciolacu, Svasta, et al., 2017; Eichinger et al., 2017).

Although there is still no universally accepted framework for what exactly the term Education 4.0 includes (Akturk et al., 2022; Chakraborty et al., 2023), it usually refers to autonomous and person-oriented learning and is based on personalised, learner-centred and adaptive learning approaches. That is, it aims to tailor the learning experience to the individual needs and abilities of each learner (Ahmad et al., 2023, p. 6; Ortiz De Zárate et al., 2024; Sapan Adhikari, 2024, p. 121). Also, the learning process is characterized by great flexibility in time and space (Castañeda, Martínez-Gómez-Aldaraví, et al., 2024; Castañeda, Mercadé, et al., 2024) and aims to develop skills based on the use of new technologies brought to the foreground by the needs of Industry 4.0 (Chituc, 2022; Ciolacu, Tehrani, et al., 2017). Education 4.0 is the answer to the challenges posed by the 4th Industrial Revolution (Aziz Hussin, 2018, p. 92; Miah Shamim, 2021). It aims at aligning skills and digital competences with technological achievements (Fisk, 2017; Miah Shamim, 2021) thus offering citizens opportunities to build a better and sustainable future through education (Ortiz De Zárate et al., 2024, p. 3920). It also prepares students for the transition to employment and enhances skills that are relevant to the labour market (Miah Shamim, 2021; Sapan Adhikari, 2024) such as digital literacy, collaboration, communication, critical thinking, creativity and problem-solving skills (Ahmad et al., 2023, p. 6; Sapan Adhikari, 2024; Souza & Debs, 2024, p. 7).

It also emphasizes lifelong learning and the need to adapt to a constantly evolving world (Garg et al., 2024, p. 200). At the same time, however, the role of the teacher is also evolving. The focus is now shifting to the role of mentor - a guide who will point the way for students to master all these skills and competences (Aziz Hussin, 2018; Castañeda, Mercadé, et al., 2024; Castañeda, Mercadé, et al. Miah Shamim, 2021; Souza & Debs, 2024, p. 12). In the context of Education 4.0 many of the available cutting-edge technologies are therefore being tested as learning tools such as Virtual Reality (VR) (Paszkiewicz et al, 2021), Internet of Things (IoT) (Verma et al., 2021), Augmented Reality (AR) (Verma et al., 2021) and of course Artificial Intelligence (AI) (Dhivya et al., 2023) which is the main tool of this research.

Although the idea of using AI in education is very old, today technology has made it so accessible that it is now part of many people's everyday lives. The main representative of these systems is ChatGPT, an advanced AI system developed in 2018 by OpenAI (San Francisco, CA, USA), based on the GPT (Generative Pre-trained Transformer) architecture. The first version of GPT was introduced in 2018, and the technology has evolved rapidly with subsequent versions, such as GPT-3 and GPT-4 (14 March 2023), significantly improving the ability to understand and generate natural language (Jürgen et al., 2023). ChatGPT, which is based on these models, offers dynamic interaction with users, allowing content creation, answering queries and providing personalized assistance. With extensive training on vast amounts of data, ChatGPT has become a powerful tool in various domains, such as education, customer service, healthcare, and scientific research (Su & Yang, 2023). At the same time, however, its development has been accompanied by ethical challenges, such as information reliability and ethical use of AI, and has received harsh criticism (Chomsky et al., 2023).

ChatGPT can be used in education as a virtual teacher, answering students' questions and providing personalized learning. At the same time, it contributes to the development of artificial intelligence (AI) literacy, i.e. the understanding, use and critical evaluation of AI technologies and their social impact. This includes knowledge of key AI concepts, algorithms and ethical issues. As an easy-to-use tool, ChatGPT empowers teachers and students, helping them to adapt to the ever-evolving world of AI with confidence and critical thinking (Ng et al., 2021; Su et al., 2023)

Moreover, modern technological developments have diversified the ways in which learning is delivered, making education more flexible and accessible. In the context of Education 4.0, three main modes of learning can be distinguished. (ii) Online distance learning, which uses digital platforms and technologies for synchronous and asynchronous activities. (iii) Hybrid learning, which combines physical and online learning through techniques such as blended learning and flipped classroom, enhancing the student experience (Miranda et al., 2021).

A variety of teaching methods and digital tools are already being tested in the STEM field with remarkable results. Blended learning offers maximum flexibility in the learning experience and connects the digital world with

traditional classroom teaching (Boltsi et al., 2024; Jones & Sharma, 2017) and it is within this model that the teaching intervention designed and described below is embedded.

THE TEACHING INTERVENTION

The teaching intervention was designed in the context of a blended learning pedagogical approach that combines traditional classroom learning (Education 2.0) with student-centered, self-regulated cyber pedagogy (Education 4.0) (Miranda et al., 2021) and was implemented from the end of February to the beginning of March in the 1st grade of the 3rd Gymnasium of Preveza, in total of 57 students. The intervention was related to the lesson of Geology - Geography B4.1 Talking about the age of the Earth and a total of 3 teaching hours were devoted to it.

- In the first lesson, after being taught the basic concepts of the course in the traditional way, the students answered a questionnaire with closed and open questions to assess their knowledge and understanding of the subject.

- In the second lesson, with the guidance of the teacher, students interacted with ChatGPT to solve questions or explain some concepts in a simpler way. Students were also given instructions on how to formulate more effective questions. They were then tasked to look for answers and additional information on the topic and compose them at home as homework.

- In the third lesson the students, after presenting their assignments, followed a discussion and then answered the same questionnaire again to measure possible differences. They also completed another questionnaire to evaluate their learning experience using ChatGPT. Both questionnaires can be retrieved from the link below: https://dkouzas.sites.sch.gr/?attachment_id=498

RESEARCH QUESTIONS

This research attempts to evaluate the learning outcomes of using ChatGPT in teaching practice, following a quasi-experimental methodological approach (Kerlinger, 1973). Although there is not full control over sample selection or intervention timing, such studies can yield reliable results (Abbott, 2011, pp. 150-154; Creemers et al., 2010, pp. 102-114). Precisely because of these limitations in randomization, quasi-experimental research is preferred in educational research, as it is conducted in real-life settings. Although this method introduces risks to validity, the selection of equivalent comparison groups can minimize these risks (Creswell, 2012, pp. 309-310; Muijs, 2004, pp. 26-32). Research is therefore based on the relationship between the independent variable (interaction with ChatGPT) and the dependent variable (students' cognitive progress) (Cohen et al., 2000, pp. 211-212). The use of pre- and post-tests, through questionnaires, allows for a reliable comparison as long as systematic data collection with even conditions is done when conducting the assessment (Hein, 1998, pp. 121-122).

The formulation of the null hypothesis is the next step, and we consider the null hypothesis to be the most conservative working hypothesis in the study of a particular question (Best & Kahn, 2006, pp. 11-12; Litwin, 1995, p. 6). In each of the following tests, therefore, the null and alternative hypothesis are formulated as follows (Schreiber & Asner-Self, 2011, pp. 244-245):

Null hypothesis H_0: There are NO significant statistical differences between the tested means of the pre- and post-intervention test scores.

Correspondingly, **alternative hypothesis H_1**: There are significant statistical differences between the examined means of the scores of the groups to be compared.

The results of statistical tests concerning the total sample population, the effect of gender and the effect of previous experience or not with AI tools are presented below.

RESULTS

DESCRIPTIVE STATISTICS

Students' responses were scored for both pre-tests and students achieved a mean score of M=4.54. After the intervention there was an increase in the mean M=5.88 as shown in Table 1.

Table 1
Descriptive Statistics of the scores before and after the intervention

	N	Mean	Std. Deviation	Std. Error	Median	Variance	IQR (Q3-Q1)
Pre_test_TOTAL	51	**4,54**	1,798	0,259	4,50	3,232	3,00-6,00
Post_test_TOTAL	52	**5,88**	2,498	.361	5,50	6,239	4,00-8,75
Valid N (listwise)	48						

So, at a first reading we see an improvement in the score. It remains to be investigated whether this increase is statistically significant.

Normality Check

In order to select the appropriate comparison test, a normality check of the data was performed to decide whether parametric tests requiring a normal distribution can be used. If not, the corresponding non-parametric tests can be used. The Shapiro-Wilk criterion was chosen for this test (when N<50 it is used instead of the Kolmogorov-Smirnov criterion) (Dafermos, 2011, pp. 268-273).

Table 2
Normality check with the Shapiro-Wilk criterion

	Statistic	df	Sig.
Pre_test_TOTAL	,962	48	,117
Post_test_TOTAL	,917	48	,002

We see that the assumption of normality while satisfied for the scores before the intervention (sig.=0.117>0.05) is not satisfied for the scores after (sig.=0.002<0.05). Therefore, the respective non-parametric tests were chosen for comparison.

COMPARISON OF PRE- AND POST-INTERVENTION SCORES

Since the data does not satisfy the assumption of normal distribution, non-parametric tests will be used for the comparison, namely Wilcoxon Signed Ranks test for the two dependent variables (pre- and post-intervention scores).

Table 3
Comparison with Wilcoxon Signed Ranks test

Ranks		N	Mean Rank	Sum of Ranks
Post_test_TOTAL - Pre_test_TOTAL	Negative Ranks	14[a]	15,14	212,00
	Positive Ranks	28[b]	24,68	691,00
	Ties	6[c]		
	Total	48		

a. Post_test_TOTAL < Pre_test_TOTAL b. Post_test_TOTAL > Pre_test_TOTAL c. Post_test_TOTAL = Pre_test_TOTAL

Test Statistics[a,c]			POST_TOTAL_SCORE -
Z			-3,023[b]
Asymp. Sig. (2-tailed)			,003
Monte Carlo Sig. (2-tailed)	Sig.		,002
	99% Confidence Interval	Lower Bound	,001
		Upper Bound	,004

a. Wilcoxon Signed Ranks Test, b. Based on negative ranks.
c. Based on 10000 sampled tables with starting seed 334431365.

The test showed that the difference in scores before (Mdn = 4.50, IQR: 3.00-6.00) and after (Mdn = 5.50 IQR = 4.00-8.75) the intervention is statistically significant (Z = -3.023, p = .003), with a moderate to large effect size (r = .47),

a result confirmed by the Monte Carlo simulation. Thus, the null hypothesis is rejected and there are statistically significant differences in test scores before and after the intervention.

TESTING ADDITIONAL FACTORS

Gender control

Regarding gender, in Table 4 we see the descriptive statistics and observe that both boys and girls showed an increase in scores, and we will then determine whether these increases are statistically significant. The null hypothesis is respectively H0: There are NO significant statistical differences between the tested means of the pre- and post-intervention test scores between boys and girls.

Table 4
Descriptive statistics for the gender factor

1=Male 2=Female		N	Mean	Std. Deviation	Std. Error	Median	Variance	IQR
Male	Pre_test_TOTAL	31	4,35	1,992	.358	4.00	3,970	3-6
	Post_test_TOTAL	31	5,71	2,411	.433	6.00	6,317	4-7
	Valid N (listwise)	31						
Female	Pre_test_TOTAL	17	4,88	1,364	.331	5.00	1,860	4-6
	Post_test_TOTAL	17	6,18	2,698	.654	5.00	7,596	4-10
	Valid N (listwise)	17						

Table 5
Comparison of scores with the Wilcoxon Signed Ranks test for each gender

Ranks					
1=Male 2=Female			N	Mean Rank	Sum of Ranks
Male	Post_test_TOTAL - Pre_test_TOTAL	Negative Ranks	8[a]	7,19	57,50
		Positive Ranks	17[b]	15,74	267,50
		Ties	6[c]		
		Total	31		
Female	Post_test_TOTAL - Pre_test_TOTAL	Negative Ranks	6[a]	8,50	51,00
		Positive Ranks	11[b]	9,27	102,00
		Ties	0[c]		
		Total	17		
a. Post_test_TOTAL < Pre_test_TOTAL b. Post_test_TOTAL > Pre_test_TOTAL c. Post_test_TOTAL = Pre_test_TOTAL					

Test Statistics[a,c]				
1=Male 2=Female				Post_test_TOTAL - Pre_test_TOTAL
Male	Z			-2,848[b]
	Asymp. Sig. (2-tailed)			,004
	Monte Carlo Sig. (2-tailed)	Sig		,003
		99% Confidence Interval	Lower Bound	,001
			Upper Bound	,004
Female	Z			-1,220[b]
	Asymp. Sig. (2-tailed)			,223
	Monte Carlo Sig. (2-tailed)	Sig		,231
		99% Confidence Interval	Lower Bound	,220
			Upper Bound	,242
a. Wilcoxon Signed Ranks Test b. Based on negative ranks. c. Based on 10000 sampled tables with starting seed 2000000.				

To determine whether there are differences in terms of gender, the Wilcoxon Signed Ranks test was performed for the two dependent variables (pre and post scores) separately for each gender (independent variables) (table 5). The

results show that only in boys the difference before (Mdn = 4.00, IQR:3.00-6.00) and after (Mdn = 6.00, IQR:4.00-7.00) is statistically significant Z = -2.848, p = 0.004<.05, with a large effect r =.57 while in girls the difference (although larger on average) before (Mdn = 4.00, IQR: 4.00-6.00) and after (Mdn = 4.00, IQR:4.00-10.00) is not considered statistically significant Z =-1.220, p = .223>.05, with a low effect r = . 29.

Relevant experience

Regarding relevant experience with ChatGPT or equivalent engines, in Table 6 we see the descriptive statistics and observe that those who reported having relevant experience (N = 38) showed an increase in mean score before (M = 4.71, SD = 1.742) and after (M = 6.18, SD = 2.639) the intervention. Those who reported no experience (N=14) also showed an increase in scores before (M = 4.08, SD = 1.935) and after (M = 5.36, SD = 2.134) the intervention.

Table 6
Descriptive statistics for the previous experience factor
Have you used AI tools (e.g. ChatGPT, Google Assistant, Siri) before this course?

		N	Mean	Std. Deviation	Variance	Median	IQR
Yes	**Pre_test_TOTAL**	35	**4,71**	1,742	3,034	5.00	3-6
	Post_test_TOTAL	38	**6,18**	2,639	6,965	5,50	4-9
	Valid N (listwise)	35					
No	**Pre_test_TOTAL**	13	**4,08**	1,935	3,744	4.00	2-6
	Post_test_TOTAL	14	**5,36**	2,134	4,555	5.50	3.75-6
	Valid N (listwise)	13					

It will then be tested whether these increases are statistically significant. The null hypothesis is respectively H_0: There are NO significant statistical differences between the tested means of the pre- and post-intervention test scores for students with relevant experience.

Similarly, there are NO significant statistical differences between the tested means of the pre- and post-intervention test scores for students who had no relevant experience with AI tools. To ascertain differences, the Wilcoxon Signed Ranks test was performed for the two dependent variables (pre- and post-test scores) separately for each category of independent variable (relevant experience).

The results show that only the increase in the score before (Mdn=5.00, IQR: 3.00-6.00) and after (Mdn=5.50, IQR=4.00-9.00) of those who reported previous experience is statistically significant Z = -2.726, p=.006<.05, with a moderate to large effect r=.48 while for those who reported having no relevant experience the difference before (Mdn=4.00, IQR:2.00-6.00) and after (Mdn=5.50, IQR: 3.75-6.00) is not statistically significant Z =-1.287, p = .198>.05, with a moderate effect r = .40

Assessment of Learning Experience

To assess the learning experience of the intervention, students completed a second questionnaire where they were asked to answer questions using a 5-point Likert scale. From the distribution of responses, it was found that students positively evaluated the learning experience as very few (6%) did not find the tool useful for their study and only a small percentage (10%) believed that it did not help them in understanding the concepts. Also, over half of the students said that the tool encouraged them to look for more information beyond what ChatGPT provided. Finally, 2 out of 3 students found learning with ChatGPT more interesting than conventional teaching.

Regarding critical thinking and reliability of information, it was observed that the degree to which students trust ChatGPT's answers is very high as only 10% do not consider them scientifically correct. This is somewhat confirmed by the fact that only 1 in 4 students said that they cross-checked ChatGPT answers with other jumps. Also 3 out of 4 students consider teacher guidance necessary. Finally, there is a universal desire of students to use ChatGPT again in future courses.

Table 7
Comparison of scores using the Wilcoxon Signed Ranks test for each gender

Ranks

Have you used AI tools (e.g. ChatGPT, Google Assistant, Siri) before this			N	Mean Rank	Sum of Ranks
Yes	Post_test_TOTAL - Pre_test_TOTAL	Negative Ranks	10[a]	11,95	119,50
		Positive Ranks	22[b]	18,57	408,50
		Ties	3[c]		
		Total	35

c. Based on 10000 sampled tables with starting seed 926214481.

DISCUSSION - CONCLUSIONS

This study examined the integration of ChatGPT into a blended learning intervention for teaching the age of the Earth in lower secondary education, combining direct instruction, guided group work, and structured student–ChatGPT interaction. The findings suggest that students perceived the approach positively, reporting that the tool supported understanding and made learning more engaging, while also indicating a strong preference for similar AI-supported activities in other subjects. At the same time, students' responses indicated that teacher mediation remains central, both to sustain productive inquiry and to mitigate risks associated with uncritical acceptance of AI-generated information (Ng et al., 2024).

Learning gains and alignment with prior research

A key outcome was the statistically significant improvement in cognitive test performance from pre-test to post-test, with a moderate-to-large effect size (Wilcoxon Signed Ranks, r≈.47). This pattern is consistent with recent K–12 evidence suggesting that, when pedagogically structured, generative AI can support conceptual learning in STEM domains. (Baroud et al., 2025). For example, a quasi-experimental study in high school biology reported higher achievement for students learning with ChatGPT compared with a control condition, supporting the view that AI-mediated dialogue can scaffold understanding when embedded in deliberate instructional design. (Baroud et al., 2025).

The results also resonate with research showing that ChatGPT-based systems can support students' self-regulated learning processes in science education, particularly when the chatbot is used as a structured learning companion rather than a mere answer generator. (Ng et al., 2024). In practice, this points to the importance of specifying roles for ChatGPT within the learning cycle (e.g., hypothesis generation, explanation refinement, question prompting), coupled with explicit criteria for evaluating response quality. (Ng et al., 2024).

At a broader level, meta-analytic evidence indicates that ChatGPT use is associated with improved academic performance and related learning outcomes, with substantial variability depending on context and intervention characteristics. (Deng, 2024; Wang & Fan, 2025). Notably, a systematic review and meta-analysis of experimental studies reported positive average effects for K–12 settings ($g+\approx0.55$) and smaller but still positive effects for science subject areas ($g+\approx0.35$), suggesting that subject matter and educational level may moderate expected gains. (Deng, 2024). Complementarily, a meta-analysis reported overall positive effects of ChatGPT on learning performance and higher-order thinking, reinforcing that effectiveness is not guaranteed by access to the tool itself, but by the pedagogical framing and learning tasks through which it is used. (Wang & Fan, 2025).

Gender and prior AI experience: cautious interpretation

The subgroup analyses indicated that both boys and girls improved on average; however, statistical significance emerged only for boys, while the girls' improvement—though present—did not reach significance. This pattern warrants cautious interpretation given the small and unequal subgroup sizes and the distribution of individual gains, which can influence non-parametric comparisons and limit generalizability. Accordingly, these results should be treated as exploratory signals that motivate further investigation rather than stable evidence of gender-based differences in the effectiveness of AI-supported instruction.

A similar logic applies to the role of prior experience with AI tools: learning gains were observed overall, but statistically significant improvement was found only among students who reported prior exposure to AI tools, while those without such experience did not show a significant change. One plausible interpretation is that prior experience reflects higher "readiness to use" generative AI, including skills in question formulation, iterative prompting, and critical evaluation of outputs. (Ng et al., 2024). This highlights the practical value of embedding short, explicit "AI literacy and prompting" micro-lessons within classroom interventions, especially to reduce inequities arising from differential out-of-school exposure. (Ng et al., 2024).

Trust, reliability, and the necessity of verification

A critical concern emerging from the findings is students' high level of trust in ChatGPT outputs coupled with limited cross-checking against external sources. This is particularly consequential in science education, where plausible-sounding explanations may still be inaccurate or inconsistent, potentially reinforcing misconceptions. (Deng, 2024). The classroom evidence that ChatGPT produced divergent answers to the same historical-scientific question (e.g., who first calculated the Earth's age) illustrates how epistemic uncertainty and "confident errors" can surface in student work when verification practices are weak.

Therefore, the pedagogical role of the teacher as mediator and epistemic guide remains non-negotiable in AI-supported science learning. (Kouzas & Athanasiou, 2025/2026; Ng et al., 2024). Effective integration requires that students be systematically taught to (a) triangulate AI outputs with authoritative sources, (b) demand evidence and references, (c) compare alternative explanations, and (d) treat the chatbot as a tool for inquiry support rather than an unquestioned authority. (Ng et al., 2024). In this sense, the value of ChatGPT lies less in replacing instruction and more in enabling structured, dialogic scaffolding—provided that AI literacy and source evaluation are explicitly taught and assessed. (Ng et al., 2024; Wang & Fan, 2025).

Limitations and directions for future work

Several limitations constrain interpretation of the findings, including the short duration of the intervention, the modest sample size, and unequal subgroup sizes (gender and prior AI experience), which restrict strong causal claims and generalization. Future research would benefit from larger quasi-experimental or controlled designs, delayed post-tests to examine retention, and richer measures of conceptual change and transfer, particularly in geoscience topics that remain underrepresented in the current ChatGPT-in-school literature. (Baroud et al., 2025; Deng, 2024). Additionally, incorporating explicit AI literacy scaffolds and measuring verification behaviors (e.g., source triangulation rates) could clarify whether improved learning gains can co-occur with stronger epistemic vigilance. (Ng et al., 2024).

ABSTRACT

The COVID-19 pandemic provided (amongst its tragedy) a springboard of electronic existence for many aspects and functions of society. All possible constituents of operations, amidst lockdowns and social distancing, shifted their operations online. As such, education had to follow as well, with a high range of applicability and effectiveness, ranging from many best practices surfacing, but also many discrepancies, such as new ways to cheat, and laptops being logged into, yet unattended. The post-pandemic reality has left the world trying to mitigate and heal from many outcomes of the coronavirus, but at the same time, and especially with reference to the education sector, relinquishing a plethora of instruments that can be utilized in teaching, thus unravelling a novel range of possibilities, and opportunities, for education.

Many universities in the world where participation in class is not mandatory, are registering record-low numbers of attendance, to the point of creating two distinct segments of students and designating them as active and inactive. Simultaneously, the experience gathered from electronic means of learning can provide a readily available solution towards inclusiveness and boosting of participation, as well as continuity in teaching. Thereby the education sector has the potential to utilize tools for streaming lectures, recording them, and sharing them on privately and/or publicly accessible video/streaming platforms, yet the question surfaces as to how the issues arising may be mitigated, such as how personal data can be safeguarded, and at the same time attendance in class maximized, as distance and hybrid teaching technologies can be perceived as drawing students away from the classroom, thereby burdening the already problematic situation of low attendance.

In the plight for the utilization of technology in education, a plethora of instruments may be used, but at the same time the educational value that is carved in class must be upheld. This situation emerges as a dilemma since on the one hand technology may facilitate the streamlined delivery of the curriculum, enabling the attainment of the respective learning outcomes, yet it may be seen as a segue towards degradation of the class culture and interaction, thus maybe leading to an eventual drop in attendance. Herein lies the research gap and contribution of the present work. After the pandemic a reasonable question surfaces, as to the instruments that can be still usable to promote distance learning, hybrid classes, and the branding of education, that many educational institutions have been taking advantage of many years, even before the pandemic. Here, notable examples refer to, e.g., MIT OpenCourseWare (with 5.63 million subscribers and 7.5 thousand videos, where entire courses have been bundled in video lists and can be accessed free of charge), Harvard, Brown University, and many others, that are using technology as a means of promoting knowledge and their brand, while crucially, boosting attendance in class as well.

Insight as to the technologies that may revolutionize teaching hopefully will allow for higher engagement, but at the same time care must be given so that technology is not abused. With the help of artificial intelligence, this paper provides a framework of the most effective strategies that can boost attendance in the classroom in tandem with the use of distance learning, hybrid teaching, presenting, and collaborating, to create a toolkit for the utilization of technology in education that will abide by specific legislation governing synchronous and asynchronous learning, safeguard personal data, and at the same time boost in-class attendance. This research is important as it provides much needed focus and analysis for a topic requiring enrichment within its body of knowledge. The research focuses on tertiary education, but its results can be replicated in all arrays of teaching.

Keywords: tertiary education, hybrid teaching, education participation, e-learning, class attendance, inclusion in education.

INTRODUCTION

In the contemporary and ever-changing era, where humanity experiences dynamic growth and fast-paced circumstances, education is a notable tool for fostering prosperity and success. Higher education paves the way for creativity and innovation in an array of day-to-day and business-driven activities, enriching mankind with knowledge and skills for coping with challenges throughout their lives (Asim et al., 2021). In recent years, the field of education, among others, has been driven by the advancements of digitalization, where innovative technologies are integrated into traditional teaching methods to improve learning and introduce new ways of knowledge sharing (Edwards-Fapohunda & Adediji, 2024). The rise of Industry 4.0 has introduced new tools and technologies, establishing a newly developed human-machine interface that can be applied in a multidimensional setting (Javaid et al., 2022). This novelty became especially important during the recent COVID-19 pandemic when the subsequent lockdowns forced organizations and educational institutions to conduct operations via the internet. As such, the concept of online education arose, which describes a form of distance learning, altering conventional learning techniques during that period by adopting new delivery styles (Al-Mawee et al., 2021). The swift transition to online education has been a new challenge for students and academia to address diverse student needs while upholding high educational standards. While familiarization with digital transformation might be adverse at first, online teaching methods provide ample opportunities to academic institutions that, if properly managed, can offer a comprehensive and structured teaching tool.

The aftermath of the pandemic transformed the educational world by offering institutions a myriad of online instruments for lecture delivery (Akour & Alenezi, 2022). The current issue lies in the practicality of hybrid learning styles in fostering student engagement in class participation while avoiding the misuse of technological advancements in learning. Driven by the current challenge, this paper aims to address this gap in the effective utilization of hybrid teaching methods in fostering student engagement, especially focusing on the role of Artificial Intelligence (AI). The paper presents a systematic approach to hybrid teaching by proposing a framework of how advanced technologies can revolutionize conventional teaching styles based on compliance with regulations and inclusivity matters. This study can prove beneficial for tertiary education practitioners to comprehend the opportunities of hybrid education and how technology can increase student commitment and improve class delivery. The paper is organized as follows. After the present introductory sector, a brief literature review is presented that is succeeded by the methodology section that documents the utilization of AI tools in the formation of the results. After the methodology section the results are analysed, and the paper closes with a discussion of its relevance and impact.

LITERATURE REVIEW

There is abundant literature on the use of technology in educational settings and especially with reference to tertiary education. It seems that technology is indeed considered as an ally to education to achieve a competitive advantage, for many years now (de Pablos & Tennyson, 2013). In recent years many technologies have surfaced and are making their way into education since they may have been proven successful in other industries; one of these examples refers to blockchain (Rashid et al., 2020). At the same time, metaverse is making its appearance known (Joshi and Pramod, 2023), and the internet is utilized along with Android™ applications (Seralidou et al., 2019) and other mobile technologies (Andrews et al., 2010) for higher education. The web is indeed an avenue with much potential for education as it can provide opportunities to many people that may face a geographical disadvantage, through the option of massive open online courses (MOOCs, cf. Nguyen et al., 2014; Nguyen et al., 2016a; Nguyen et al., 2016b). E-learning and IT applications have made their way into the terrain of education and are there to provide a tool and a segue towards the resilience of education (Yun, 2007). Other examples include augmented reality (Majid and Salam, 2021), AI-augmented frameworks (Filippidi et al., 2023), and lecture capture through videos and multimedia technologies (Hakala et al., 2021; Lindsay & Evans, 2022).

The topic of attendance can be regarded as crucial especially with the emergence of new techniques in education. As such, blended learning has been regarded as a viable alternative (Wong & Kwok, 2022), along with on-line projects (Soares et al., 2019) and flipped classrooms (Volchenkova, 2019). Interactive teaching will always have its benefits in education (Pawar et al., 2021), yet the effect of technology especially concerning not only distance learning (Matzakos & Kalogiannakis, 2018), but also the use of a learning management system (Barua, 2019) remains a concern. Thereby, in this context, it would be interesting to investigate the potential of artificial intelligence to develop means and methods introducing novel tools and techniques that can be utilized within and outside of the classroom to facilitate the educational process. In this context, the present paper fills this specific research gap, providing a functional framework for the utilization of technology in higher education.

METHODOLOGY

The paper utilized a combination of research methods to formulate the proposed framework. As such, this research harnessed the capabilities of Artificial Intelligence, employing the GPT-4.5 language model created by OpenAI (ChatGPT) to assist the process. The deployment of ChatGPT merely assisted in formulating the framework by analysing and synthesizing information comprehensively (Grassini, 2023). Results were extracted via secondary research, i.e., a systematic literature review by academic journals and educational-oriented papers. Scientific databases such as ScienceDirect, Elsevier, ResearchGate, and Springer supplied peer-reviewed research to underpin the framework's foundation in evidence-based methodologies. Findings derived from research on higher education and distance learning practices in the post-COVID-19 era. It is essential to emphasize that although ChatGPT supported the synthesis of framework components, the critical assessment, selection, and interpretation of academic references and practical recommendations were still subject to human creation and oversight.

The research findings focus on digital platforms and technologies that have already been utilized by universities worldwide during the COVID-19 pandemic or, in some cases, for fostering commitment and engagement within classes. Thereafter, there is no concise feedback about the integration and effectiveness of those technologies as a primary curriculum delivery in combination with traditional teaching styles. Besides, some of these tools may soon become obsolete, or their application may need revision due to the rapid technological advancements that introduce newly developed technologies for hybrid teaching styles in tertiary education. The presence of primary data would benefit the study, as feedback from different universities across different nations could provide valuable information about the actual application of those technologies and their effect on student engagement.

RESULTS

The present framework proposes several distance learning opportunities and their contribution to student engagement in class participation. Results highlight the potential of a hybrid educational style, interactive digital platforms, AI-driven mentorship, and the concept of gamification in boosting student commitment to education while integrating digitalized tools in traditional teaching methods in higher education.

A. Hybrid Education. Hybrid education, sometimes referred to as hybrid or blended learning, integrates in-person classroom teaching with online learning elements in a cohesive manner. It developed as a method to enable both on-site and remote students to engage in the same courses concurrently, harmonizing in-person and virtual activities for a cohesive experience. By integrating synchronous (real-time) and asynchronous (self-paced) methodologies, institutions can deliver comprehensive educational experiences that serve the diverse student needs while at the same time enhancing their overall productivity (De Bruijn-Smolders & Prinsen, 2024). Hybrid learning experienced accelerated acceptance during and after the COVID-19 pandemic, as institutions across the world were necessitated to integrate online and offline instruction. Synchronous lectures on platforms such as Zoom and Microsoft Teams facilitate instantaneous interactions between educators and learners via features like live polling, breakout sessions, and real-time discussions. In a synchronous Zoom session, an instructor may present lecture materials, periodically pausing to utilize breakout rooms for small group discussions, allowing students to collaboratively analyse complex topics before reconvening for summary presentations[1]. Asynchronous resources offered via Learning Management Systems (LMS) such as Blackboard or Moodle allow students to access recorded lectures, readings, and assignment instructions at their own convenience. An exemplary case entails an instructor disseminating a weekly recorded lecture accompanied by supplementary readings, followed by structured online discussion forums that foster reflective engagement and peer interaction. Hybrid sessions effectively combine in-person and digital participation, suitable for contexts delineated by Greek legislation, including inter-institutional collaborations. A course across various campuses may hold in-person classes at the primary institution while simultaneously live-streaming sessions to remote students, guaranteeing equitable educational access.

B. Interactive Digital Platforms. Interactive digital platforms in education denote online settings, including learning management systems, virtual classrooms, and educational applications, that provide access to material, communication, and collaboration for students and instructors outside the traditional classroom setting. Advancements in technology and the pervasive availability of the internet have led to the emergence of several digital learning tools, offering extensive resources and interactive functionalities for the educational setting (Zhao, 2024). Research by Martín-Sómer, Casado, and Gómez-Pozuelo (2024) indicates that interactive digital platforms significantly improve student engagement through the promotion of dynamic and collaborative learning experiences. Certain interactive digital tools are particularly effective in promoting active student participation, facilitating real-time engagement, and fostering dynamic collaboration. The following digital platforms have been already exploited, showcasing their effectiveness in

[1] https://media.zoom.com/download/assets/Zoom-for-Higher-Education_Data-Sheet+%282%29+%281%29.pdf/6a5a26a6e44511ed9abba275a1b6838c

practical academic contexts. Padlet functions as a collaborative platform, allowing students to articulate their ideas, inquiries, or resources pertinent to current lectures or projects. This can be exemplified in an academic context through a history class. Students may collaborate to develop timelines or compile resource links on Padlet, fostering collective understanding and engagement[2]. Mentimeter facilitates immediate audience engagement through dynamic presentations, polls, and quizzes. This example illustrates the application of Mentimeter in a practical context, specifically for a biology teacher who can utilize the tool to assess students' comprehension of intricate biological processes through real-time quizzes. Facilitating prompt modifications in teaching methodologies informed by immediate feedback rather than solely relying on intuition[3]. Another interesting digital tool is Kahoot! This gamified tool enhances educational engagement by enabling educators to design interactive quizzes and games that effectively engage students. For instance, Kahoot! Quizzes may be employed in a finance class to enhance the learning experience of financial ratios, thereby increasing student motivation and engagement (Martín-Sómer, Casado & Gómez-Pozuelo, 2024). Additionally, it is essential to note that students can effectively collaborate on projects and engage in discussions using tools such as Slack, Notion, and Google Workspace, which offer various features that enhance online cooperation. Students in a business class may utilize Slack for rapid discussions regarding projects, Notion for collaborative assignment work and due date management, and Google Workspace for simultaneous sharing and editing of documents, thereby minimizing unnecessary feedback exchanges[4].

C. AI-Driven Mentorship. Another critical component of this study is AI driven mentorship, which refers not to fully automated tutoring but to the use of artificial intelligence as a facilitator that connects students with mentors based on real-time academic needs. The core innovation of this component lies in the creation of an application, conceptually similar to existing platforms such as the MentorCruise[5], which will utilize the power of AI to instantly connect students with mentors based on their specific academic concerns or challenges (Alam, 2021). Therefore, creating a space for concentrated and effective learning opportunities. The process will be straightforward for the students, as they just must enter a question or a difficulty, they may have into a single AI system and the machine learning algorithm will quickly link them with available suitable mentors, including professors, experienced students, or recent graduates. According to a present study by Kovari (2025), individualized learning routes, targeted feedback systems, and predictive analytics help to greatly increase academic performance. For example, a student who finds specific statistical methods difficult to grasp, may be quickly paired with a statistics graduate or mentor to quickly solve any of the questions he or she may have. After that encounter takes place, a digital mentoring repository will track past mentoring interactions and provide students with continuous access to issues that have been resolved as well as instructional resources, therefore supporting independent and lifetime learning. The inclination toward tailored and multimodal data-driven strategies has been observed to raise both general effectiveness of the mentoring experience as well as student participation (Bearman et al., 2022).

D. Gamification. Gamification in education is the process of incorporating aspects of game design, such as leaderboards, levels, challenges, badges, and points, into educational activities to increase student motivation and engagement (Wang et al., 2022; Cale et al., 2024). The fundamental concept is the use of the enjoyable and immersive elements of games to enhance educational experiences, making them more engaging and rewarding for students (Swacha, 2022). Incorporating elements of gamification into educational settings greatly enhances student motivation, attendance, and active participation (Antonopoulou et al., 2022). Institutions can adopt digital badges, certificates, and leaderboards to visually recognize and reward students for their regular attendance and active participation. As noted by Ratinho & Martins (2023), popular gamification elements such as points, leaderboards, competition, and digital badges have been shown to effectively boost the overall student motivation and engagement. For example, students who maintain perfect attendance throughout a semester might earn digital badges that are prominently showcased on their academic profiles, boosting their intrinsic motivation and improving their sense of competence (Ratinho & Martins, 2023). Learning strategies that focus on rewards offer organized incentives, like certificates or privileges, associated with educational achievements. Ratinho & Martins (2023) state that reward-based approaches positively affect students' sense of autonomy and relatedness, essential components of intrinsic motivation according to self-determination theory. For example, students consistently participating in interactive sessions might gain priority registration for elective courses, fostering a stronger connection to their educational environment and improving their motivational levels. Moreover, the existence of competitive elements in fun academic events and scoring systems motivates students to engage actively in their educational process. A realistic situation might be a monthly Kahoot! quiz challenge that promotes friendly competition and improves knowledge on specific topics. While gamification techniques may rapidly increase enthusiasm and involvement of the students, Ratinho & Martins (2023) cautions teachers about possibly declining returns over time due to the uniqueness factor. To keep students invested over an extended period, they stress the importance of constant innovation and diversity in the gamification aspects.

E. Personal Data and Security Compliance. The framework's validity encompasses strict adherence to legal laws and legislations, including the General Data Protection Regulation (GDPR). Europe's strongest privacy and security law worldwide, adopted in 2016 and entered into force in 2018, describes the rights of individuals and the obligations of data processing when exploiting digital applications[6]. The rise of technological advancements is associated with various hidden risks affecting human rights and personal data. GDPR has become an integral part of the collection, processing, and storage of sensitive personal information that protects both parties' rights and obligations. As part of the hybrid teaching revolutionary approach, this framework obeys GDPR and obliges academic institutions to act ethically upon this transition. Utilizing hybrid teaching methods and digital platforms requires institutions to maintain transparency toward data management practices, such as collection, processing, and sharing of digital content. The terms and conditions of online class recordings and the uploading of digital content should be clearly communicated by the faculty to students, ensuring continuous compliance with data protection. A notable practice that institutions shall follow is the correct information about privacy rights and regulations while using digital tools through the distribution and signing of GDPR forms. That is an already existing practice that is being done for students to consent to the use of digital applications during classes, online class sharing, and class material uploading in educational digital platforms. The use of GDPR-compliant educational platforms will ensure secure user authentication processes and comprise a crucial step in maintaining trust and legal adherence within educational institutions. Adopting a safety culture of digitalization allows both faculty and students to feel confident with the integration of hybrid education methods in conventional teaching, harnessing their capabilities and taking advantage of them while adding value to the traditional teaching style. In Greece, the implementation of synchronous distance education and asynchronous distance learning platforms are governed by Articles 67 and 68, respectively, by the Greek Law 4967/2022. This law provides a list acknowledging all the conditions under which online education may be applied in the Greek educational setting, especially in tertiary education. To maintain institutional integrity, institutions shall conduct periodic reviews and audits of data-handling processes to ensure ongoing compliance with national regulations.

F. Accessibility and Inclusivity. A crucial dimension of this framework is to foster accessibility and inclusivity of tertiary education by providing equitable learning opportunities to everyone through hybrid teaching. As higher education enriches humanity with necessary knowledge and capabilities, nations should guarantee that nobody is deprived of the right to pursue a major in an educational institution. By adopting a hybrid teaching approach universities and academic institutions allow for a more comprehensive and holistic approach to learning, providing the opportunity for several groups of people to study. Accessibility is of utmost importance in the case of students with disabilities or special educational needs, students of all ages, teen parents, young workers, students with economic difficulties, and so on. Inclusivity is equally crucial in the educational world, with digitalization offering the appropriate tools to bridge the gap of a comprehensive teaching approach. For instance, online class presentations shall be enriched with automatic or manual captioning services for easier and more effective material sharing with all students. Similarly, course material may be shared in multiple formats, covering audio recordings, PDFs, and accessible documents catered to meet a wide range of learning styles and preferences. Other interesting tools are speech-to-text software and screen readers that can be integrated into institutional platforms, making class material more comprehensible, thus covering every educational need. Institutions should make sure that accessibility and inclusivity are integral parts of the educational setting and meet the demands of all groups of people.

Implementation and Scalability. Effective implementation of this framework necessitates an initial pilot phase emphasizing theoretical or non-practical courses. Pilot courses shall be selected strategically, considering manageable class sizes and instructor preparedness, to facilitate targeted assessment and reduce disruptions. Surveys and focus groups involving students, faculty, and administrative staff will provide structured feedback to identify strengths and areas requiring adjustment. After conducting pilot evaluations and making necessary adjustments, institutions ought to incrementally implement the program across comparable courses and extend it to other departments. Ongoing professional development and training for faculty will enhance consistency and confidence in the integration of the framework in higher education. Nevertheless, as student numbers grow, maintaining personalization and engagement becomes challenging. Effective strategies such as creating smaller discussion cohorts, integrating AI-based personalized feedback, and peer mentorship programs, where senior students or alumni support newer learners, have proven effective in preserving student connection and motivation on a scale.

DISCUSSION

[6] https://www.consilium.europa.eu/en/policies/data-protection-regulation/#:~:text=The%20EU%20general%20data%20protection,may%20be%20processed%20and%20transferred.

Tertiary education is a dynamic field that requires students to engage in deep learning and class interaction to progress and grow. The fierce impact of the COVID-19 pandemic, which led to a global lockdown for over six consecutive months, obliged educational institutions to restructure their teaching methods so that education can become remotely accessible (Sato et al., 2023). Online education and distance learning proved to be an innovative option at the time, transferring the entire in-class experience into e-classes via digital platforms (Maqsood et al., 2021). Online streaming via MS Teams, Zoom, or other similar platforms, has been a fascinating tool, allowing class participation, engagement, and interaction. Lectures were live-streamed, and presentations were shared and recorded so that students could keep the information for future reference (Masalimova et al., 2022). Exams were taking place online, using proctoring systems to avoid cheating, meetings were conducted online, and so on. The adaptation to the new delivery style offered the chance for students and faculty to further expand their horizons by familiarizing themselves with advanced e-learning methods (Anzaldo, 2021). The aftermath of the pandemic offered a new opportunity in the educational sector to integrate a hybrid teaching approach to the learning experience.

Hybrid education offers myriad opportunities to the educational world, offering a holistic and systematic approach to knowledge. While hybrid education is associated with several concerns of reducing class attendance, student engagement, or downgrading the quality of education, in fact, digital instruments can open new ways toward effective learning by keeping students motivated and always connected to the institutional world. As such, it shall be exploited, following the existing institutional aims without jeopardizing and/or replacing traditional in-class lecture delivery. The purpose of hybrid teaching is to offer an improved in-class experience by adopting digital platforms to further revolutionize the conventional style of teaching in higher education. In universities, where class attendance is not rigid and, thus, are registering low attendance records, technology can provide the solution by means of electronic participation and engagement. The latter can be also achieved by integrating gamification tools within classes, as playfulness enhances students' motivation to learn and the acquisition of new skills by actively participating in quizzes and competitive-driven games (Antonopoulou et al., 2022). This approach provides the opportunity to young professionals or special groups of people who, for whatever reason, wish but are unable to attend face-to-face classes to bridge the gap between education and special inconveniences. The same applies when students need to be absent from class due to an emergency but wish to participate online so that they do not take an absence or miss lecture delivery. That gives students the freedom and the critical capacity to decide when and whether they can exploit the benefits of hybrid teaching, instead of losing the whole lecture. Besides, hybrid teaching creates a sense of safety in the sense that no critical information shall be lost if someone cannot attend class. As many courses include demanding material, the use of video recordings or the uploading of the lecture on digital platforms ensures that students have the whole class presentation to look at, without feeling overwhelmed by any lost material.

Notably, tertiary education can benefit from the effects of digitalization by revolutionizing the conventional teaching style with new sophisticated class delivery opportunities worldwide. The proposed framework describes a series of alternatives that could pave the way toward hybrid education. The purpose of the framework is to boost instead of replacing in-class attendance by offering a more holistic approach to lecture delivery. Hybrid teaching can enhance student commitment and engagement in class while providing assistive technologies for easier material comprehension and two-way communication between faculty and students. As this new teaching style has not been recognized as a universal approach to education and is only applied in distinct cases and educational institutions, many things are to be considered, such as the ethical perspective of digital tool utilization or the purposes it satisfies. Obeying GDPR and national legislation is a critical step in the implementation process, securing the privacy rights of both parties while clearly defining the terms and conditions of technological applications as part of the traditional teaching method. All parties should be explicitly informed about the purpose of online education and consent to the use of digital class tools that may contain sensitive personal information. Transparency and communication are among the top priorities in such a digital transition, creating a sense of safety for the educational community to accept and encourage hybrid teaching, thus fostering educational prosperity and growth.

CONCLUSION

The effects of digital transformation are gradually becoming evident in tertiary education. Ever since the outbreak of the recent pandemic, online teaching has been an effective tool for sharing knowledge and prompt e-class participation, even in the most difficult times humanity may face. As education is an indispensable yet continuous procedure, it is essential to adopt an alternative approach to teaching to ensure it is widely accessible for everyone who wishes to participate in this experience. While digitalization became an extremely crucial tool to higher education during lockdown periods, e-learning methods have yet to be integrated into the universal educational approach. While ample opportunities for digital tools have flourished in the educational context during COVID-19, the current challenge lies in the utilization of technology in education while upholding the traditional class culture and attendance policy. In fact, there must be a harmonic combination of conventional and digital-driven teaching styles so that students and faculty can benefit from the

advantages of digitalization, improving the quality of communication and interpersonal relations in class. Through lesson recordings, online class sharing, AI tools, and gamification practices, students come closer to education, being able to access shared knowledge easily, thus increasing comprehension and continuous development. The appropriate use of digital instruments in education can increase engagement and commitment in class, boosting participation and attendance in lectures. Evidence from well-known universities worldwide paves the way toward adopting hybrid teaching techniques without disengaging students from institutional goals. As this transition is associated with several implications, such as human rights and GDPR, institutions must pay special attention to adopting such technologies ethically and responsibly.

This study has presented several digitalized methods that have the potential to boost a hybrid educational setting, highlighting their contribution to student engagement and inclusivity. The role of ChatGPT was instrumental in the formation of the results, proposing the most influential tools for this matter. This work pertains to a future direction of how hybrid teaching can be integrated as a universal technique in Greek universities, among others, and evaluate the effectiveness of those techniques in improving student participation while fostering traditional teaching methods.

Email: nadia_giotakou@yahoo.gr

ABSTRACT

A fundamental characteristic of human personality is creative thinking. Although humans are inherently creative beings, the extent to which this capacity develops largely depends on the degree of support provided by the sociocultural environment, including education. Cultivating creativity has become a primary objective for most educational systems in the 21st century. Nevertheless, schools in Greece appear to struggle with fostering the conditions necessary for students to think "outside the box." Empirical evidence suggests that creativity is enhanced through student engagement in creative writing processes, particularly when generative artificial intelligence is incorporated (AI), which opens new avenues in the complex process of writing. However, the integration of AI technology has also raised significant concerns, with many arguing that it may lead to dependency and, ultimately, to a weakening of the human element.

The aim of the present study is to investigate lower secondary school students' perceptions of the impact of artificial intelligence on creative thinking. Specifically, the study seeks to address the following research questions: 1) How do students evaluate the influence of artificial intelligence on creativity? 2) How do students perceive the appropriate use of artificial intelligence in cultivating creative thinking?

The present research adopts an exploratory, qualitative design with a phenomenological approach, aiming to understand the expectations and significance that students themselves attribute to artificial intelligence. Moreover, it is situated within the theoretical framework of self-determined learning and Vygotsky's sociocultural theory of cognitive development. Twenty lower secondary school students engaged in creative writing activities using ChatGPT. Given the limited existing knowledge regarding how students engage in creative writing with the assistance of writing tools and how instruction should be structured when using such tools, the lesson was designed as a workshop. It included specific learning objectives and activities aimed at the development of the cognitive skills of recall, understanding, application, analysis, and reflection. Upon completing the activities, participants assessed the creativity in their work using a rubric based on the criteria of imagery, voice, characters, and narrative (Mozaffari, 2013; Zedelius et al., 2018). They also completed an open-ended questionnaire and participated in focus groups.

The descriptive data were analyzed thematically and revealed that participants used AI to overcome challenges encountered during the writing process. With its assistance, they gained access to alternative ideas that nurtured divergent thinking and problem-solving skills, while also supporting emotional development through the satisfaction of psychological needs. However, the findings also indicated that not all students possessed the ability to critically evaluate outputs, generate original ideas, or maintain an authentic personal voice. A deeper understanding of the emerging potentials and limitations of AI could help educators design instruction more thoughtfully and adopt more effective strategies for enhancing creativity.

Keywords: creative thinking, artificial intelligence, student perceptions, secondary education

INTRODUCTION

Creativity is regarded as a critical 21st-century skill, essential across diverse domains of knowledge, including science and technology, economic activity and cultural expression (Rawlings & Cutting, 2024; Vincent-Lancrin et al., 2019). It is not the exclusive privilege of gifted individuals, but rather a capacity that can be nurtured in all people, provided they are situated within a supportive environment (Kaufman & Beghetto, 2009). Given its association with self-actualization and overall well-being, fostering creativity constitutes a primary objective of educational systems, including the Greek educational system (Akpur, 2023; Rahimi & Shute, 2021; Rawlings & Cutting, 2024). However, a persistent pathology within the Greek educational context is its reliance on traditional teaching practices that favor rote memorization and the accumulation of factual knowledge. Findings from the 2022 PISA Program (Institute of Educational Policy, 2022) reveal that Greek students perform below the OECD average in creative thinking.

An effective approach to enhancing students' creative thinking may lie in the adoption of creative writing practices. Creative writing is widely recognized as a valuable pedagogical tool that supports the learning process by increasing intrinsic motivation and student self-confidence (Maley, 2012). Empirical evidence highlights that engaging in creative writing activities encourages students to actively experiment with novel ideas and, through continuous inquiry into the "why" and "how", develop cognitive flexibility (Maley, 2012; Fitria, 2024). Recent advances in generative artificial intelligence (AI) have further expanded the potential of the writing process. Writing assistants such as ChatGPT offer support at all stages of writing — ranging from idea generation and content organization to the refinement of the final text — through an iterative process of reflection. However, However, artificial intelligence technology has also generated significant concern. It has been argued that excessive reliance on such tools may ultimately diminish human cognitive engagement and deprive students of critical learning experiences (Kim et al., 2025; Maphoto et al., 2024; Wang, 2024).

To enable more meaningful interactions between students and generative AI tools in the realm of creativity, it is imperative to understand how students employ these technologies and how they evaluate the practices they adopt. Only a limited number of studies have investigated the integration of AI tools into creative writing processes, particularly at the lower secondary level, where students are still considered novice writers. Additionally, educators often lack the opportunity to observe the strategies students employ while composing their texts. This understanding becomes even more obscure when AI tools are involved. Considering the growing influence of artificial intelligence in the near future, insights into students' perspectives could inform the future design of curricula and teaching strategies aimed at achieving a balanced coexistence between human and artificial intelligence (Kim et al., 2025; Maphoto et al., 2024; Wang, 2024). The present study, therefore, aims to explore lower secondary school students' perceptions of the impact of artificial intelligence on creative thinking. Specifically, it seeks to address the following research questions: 1) How do students evaluate the impact of artificial intelligence on creativity? 2) How do students perceive the appropriate use of artificial intelligence in fostering creative thinking?

LITERATURE REVIEW

Creativity and Creative Writing

Creativity is a multifaceted and often ambiguously defined concept, a fact that continues to hinder its systematic development (Proctor, 2014). Over time, multiple theoretical approaches have been proposed to define it, including psychoanalytic, cognitive, socio-psychological and neurobiological perspectives (Batey, 2012). Although there is no universal consensus, most definitions converge on certain key dimensions such as originality, novelty, adaptability to changing conditions, cognitive flexibility and curiosity (Kharkhurin, 2014; D'Souza, 2021). According to Rhodes (as cited in Batey, 2012), creativity encompasses personality traits, the creative process itself, the final product and the surrounding sociocultural context. Creativity can be cultivated both individually and collectively (Akpur, 2023). Boden (1998) distinguishes between ideas that are creative solely from the perspective of the individual who conceived them and those that are considered original on a societal level. She further identifies three distinct types of creativity: combinational creativity (reconfiguring familiar ideas in new ways), exploratory creativity (deepening understanding of existing conceptual spaces) and transformational creativity (altering the structure or essence of existing ideas).

Until recently, creativity was considered a uniquely human trait — an assumption increasingly challenged by recent developments. Some scholars argue that with ongoing advances in technology, computers can now exhibit creativity and originality comparable to humans. Others contend, however, that the goal should not be to replicate human intelligence but to facilitate synergy between human and artificial intelligence (Epstein et al., 2023; Treglia & Tomassoni, 2024). According to Mollick and Mollick (2023), tools like ChatGPT augment human creative thinking, but human input remains indispensable, as the prompts provided by users directly shape the quality of AI-generated content.

Creativity plays a pivotal role in the process of written expression, as the two are interrelated in a dialectical relationship (Kim et al., 2025; Maphoto et al., 2024; Wang, 2024). Creative thinking often initiates the writing process, while sustained engagement with writing activities further activates students' imagination. Both processes are simultaneously cognitive, social and cultural in nature and are shaped by individual differences in linguistic competence, knowledge base and emotional involvement (Kim et al., 2025; Maphoto et al., 2024; Wang, 2024). Creative writing is recognized as an effective student-centered practice that fosters divergent thinking and helps make abstract concepts more tangible and comprehensible. It is a complex process that requires the orchestration of multiple skills. Far from being merely the act of composing a story, creative writing is a dynamic act that emphasizes elements such as imagery, character development, voice and narrative structure—all of which contribute to the cultivation of critical thinking. By enabling students to explore and gradually construct their cultural and personal identities, creative writing enhances student engagement, contributes to emotional well-being, increases motivation and gradually leads to a more meaningful learning experience (Mozaffari, 2013; Di Domenico & Ryan, 2017).

Generative Artificial Intelligence and Creative Writing

Users “interact” with generative artificial intelligence (GenAI) — which mimics human cognitive processes — to produce original content tailored to their needs. With appropriately crafted prompts, they can generate text, videos, or images within minutes. GenAI is thus capable of replicating, to varying degrees, all types of creativity, particularly exploratory creativity (Treglia & Tomassoni, 2024). The most recent developments in GenAI have the potential to transform how students approach writing as a fundamental literacy skill. Research in educational contexts indicates that ChatGPT and other AI writing assistants can support various stages of the writing process, such as organizing and refining narrative or argumentative texts (Guo et al., 2023), correcting grammatical and syntactic errors (Park, 2019), and encouraging reflective practices while simultaneously increasing students’ engagement and enthusiasm for writing (Wu, 2022). Additionally, GenAI can improve writing efficiency and productivity by reducing the time and effort required, and by helping learners find meaning in their tasks — factors that enhance intrinsic motivation and overall satisfaction (Noy & Zhang, 2023). It can also help students overcome the anxiety associated with the “blank page” and the fear of failure, by offering multiple starting points for their compositions (Doshi & Hauser, 2024).

However, it is important to acknowledge that GenAI has a dual nature: while it offers substantial benefits, it also entails certain risks. The provision of predefined ideas can constrain creative freedom, particularly for novice writers such as students, and may result in the generation of homogeneous narratives (Doshi & Hauser, 2024). Moreover, the reduction of effort may diminish students’ sense of ownership and the perceived value of their work. Consequently, their level of satisfaction with the writing process may decline (Rivera et al., 2025). Dependence on AI tools may also limit opportunities for social learning and feedback from teachers and peers —interactions that are critical for both cognitive and socio-emotional development (Zimmerman et al., 2023).

THEORETICAL FRAMEWORK

This study adopts both the Self-Determination Theory and Vygotsky’s Theory of Mediation. By integrating these two theoretical approaches into its methodology, the research embraces the connection between creativity and enhanced motivation, as well as the importance of creating a dynamic and supportive learning environment (Syrewicz, 2022). Such a framework is essential for addressing the cognitive and psychological needs of students in “uncharted” situations — such as the emerging practice of writing with the assistance of generative artificial intelligence. It contributes to increasing student engagement and, by extension, improving learning outcomes. Emphasis is placed on satisfying three fundamental needs, which are considered critical for fostering motivation: autonomy, which relates to freedom of choice; competence, which concerns achieving desired outcomes; and relatedness, which involves the sense of belonging to a community (Evans & Boucher, 2015; Syrewicz, 2022).

METHODOLOGY

The present study follows an exploratory, qualitative research design. Its goal is to gain an in-depth understanding of the processes underlying the interaction between students and artificial intelligence, to map individual responses, and to explore the meanings attributed to students’ choices and actions (Cohen et al., 2007; Creswell, 2011). A phenomenological approach was selected, allowing the research to focus on participants’ experiences before proceeding to theoretical assumptions. This approach is always applied in relation to the context within which individuals act (Cohen et al., 2007; Creswell, 2011). Given the limited existing understanding of students’ engagement with ChatGPT in the context of creative writing, a phenomenological lens is particularly useful in capturing the meanings and expectations students associate with artificial intelligence. Participants were selected through convenience sampling. The study

involved twenty first-grade lower secondary school students (Grade 7), chosen based on their accessibility and availability, as they all participated in the school's innovative Creative Writing Program. A common characteristic among participants was that they were novice writers, engaging in creative writing activities for the first time. In terms of cognitive performance, the group was heterogeneous; however, most students fall within the good or even high-grade range. Similarly, in terms of socio-emotional engagement, most students made efforts and participated actively during the activities. All participants had basic knowledge of how ChatGPT operates.

RESEARCH DESIGN

The study was conducted during the first semester. Given the limited existing knowledge about how students engage in creative writing with the support of writing assistants — and how creative writing should be taught using such tools — the course was structured as a workshop with clearly defined learning objectives and activities. The design of these activities aimed at developing the skills of recall, comprehension, application, analysis and reflection. In the first phase, through the comparison of fairy tales, the genre's characteristics were introduced. Students engaged with the concepts of setting, time, the protagonist, supporting characters as well as the development of the plot. They were then asked to write an original fairy tale without any technological assistance. Upon completion, they self-assessed their work using a creative writing rubric and reflected on the process by answering open-ended questions in a questionnaire. In the second phase, students were introduced to ChatGPT and trained in its use. They were then tasked with writing a second fairy tale, this time with the option to use AI assistance in any way they chose, without specific guidance. As in the first phase, they assessed their own work and responded to a second set of open-ended questions. Following the writing phases, semi-structured focus group interviews were conducted. Participants were divided into four groups of five and took part in in-person interviews, each lasting approximately 30 minutes, where they shared their views on the use of generative AI in creative writing.

DATA COLLECTION AND ANALYSIS

Aligned with the interpretive phenomenological design, the following data were collected: a) the two written texts (fairy tales) produced by each student, b) the results of their self-assessment using a rubric evaluating three criteria: adaptation/responsiveness, originality (inspiration, plot, language), and the final text's editing quality (Government Gazette 211/11-11-2016 vol. A), and c) responses to the open-ended questions from the two questionnaires and the focus group discussions. Open-ended questionnaires and focus groups were chosen as data collection methods to enable deep insight into participants' perceptions, experiences, and emotions regarding AI use. These tools highlighted how students interacted with AI, the changes made following ChatGPT's responses, and their decision-making processes during the different stages of writing. The integration of data from multiple sources for triangulation not only enriched understanding of participant experiences but also strengthened the study's reliability and validity, despite the small sample size (Cohen et al., 2007; Creswell, 2011). A thematic analysis approach was employed, a common practice in qualitative studies for identifying patterns and themes. The first step involved an initial reading of the data to gain a general overview of participants' perspectives. This was followed by initial coding guided by the research questions, during which all relevant insights were noted. The next step involved grouping the data to identify relationships and emerging patterns. The analysis concluded by linking these patterns to the existing literature (Cohen et al., 2007; Creswell, 2011).

FINDINGS

The findings related to the first research question indicate that students identified both benefits and challenges in using generative artificial intelligence for creative writing. Thematic analysis resulted in four benefit-related themes and five challenge-related themes. Regarding the second research question, the data were coded into two main themes.

Benefits of Using Generative AI in Creative Writing

Enhancement of Creative Thinking

The use of generative artificial intelligence enhanced convergent thinking. AI supported students in logically structuring their ideas into coherent narratives that met assignment criteria. ChatGPT provided scaffolding that helped students revise and improve their writing. At the same time, it also fostered divergent thinking. The AI relieved students from the stress of writing by offering multiple prompts that encouraged them to explore new and diverse ideas. This process supported originality as well. By entering well-constructed prompts, students were able to guide their stories toward unexpected developments, conflicts, twists, and surprise elements. Additionally, it enhanced flexibility and problem-solving abilities. Students overcame creative blocks, which are often more prominent among inexperienced

writers, and were able to find solutions to narrative problems — using various storytelling approaches, adding new adventures, and developing well-rounded characters.

Fostering Language and Literary Literacy

Creative writing with generative AI also supported the development of language literacy. Students came to understand the different stages of writing. They reported that working with ChatGPT made them appreciate the importance of planning and outlining, a stage often skipped when writing independently in class or at home. Through different prompts, students first outlined their stories and then proceeded to write them, enabling them to identify areas in need of clarification or revision — thus allowing them to add their personal touch. Furthermore, AI helped them identify and correct misconceptions. In traditional classroom settings, students often memorize literary theory elements for tests without fully understanding them. However, through their interaction with AI, they applied these concepts to stories of personal interest or relevance, making them more tangible and comprehensible. Finally, it enhanced students' linguistic awareness. Common issues in student writing—such as lack of clarity or weak expression—were addressed through AI-generated suggestions. AI support facilitated the identification and enhancement of weaknesses by suggesting alternative expressive tools to convey subtle semantic nuances and by correcting errors in grammar and syntax.

Enhancing Technological Literacy

Interaction with AI helped students become familiar with emerging technological tools and develop digital competencies vital in today's world. To generate their stories, students had to input prompts—many of which were initially ineffective. This prompted an iterative process of trial and refinement, gradually leading to the desired output.

Meeting Emotional Needs

Generative AI also addressed students' emotional needs, beginning with increasing engagement. Students reported that the learning process was more enjoyable compared to traditional instruction. Their personal involvement in crafting individualized stories aligned with their interests and experiences boosted focus, attention and curiosity regarding AI's possibilities. AI also enhanced students' sense of competence. Participants were required to apply prior knowledge and adapt strategies according to each stage of the writing process. Having a non-judgmental assistant who offered immediate feedback helped them overcome difficulties - enabling them to complete tasks they might have otherwise abandoned - and strengthened their self-confidence. Finally, the use of AI cultivated positive emotions toward writing. Writing is a complex process that demands the coordination of multiple skills. It is therefore not surprising that many students find it challenging, often expressing reluctance or even aversion toward participating in writing tasks — particularly those involving creative writing. AI reduced the cognitive load and effort required, making students more receptive and comfortable with written expression.

Challenges and Limitations of Using Generative AI in Creative Writing

Overreliance on AI

Students expressed concerns about becoming overly dependent on AI tools. The inability to complete a writing task without ChatGPT risks turning the tool from a supportive aid into a crutch. In the long term, this could hinder the development of writing skills and limit intrinsic motivation, as the need for autonomy in decision-making and expression is not adequately fulfilled.

Uncritical Acceptance of AI-Generated Content

Students admitted that in several cases, they accepted ChatGPT's suggestions without critical evaluation, dismissing their own ideas as incorrect or of lower quality. This behavior does not foster meaningful interaction with the tool and results in missed opportunities for knowledge construction.

Potential Loss of Originality, Creativity, and Authenticity

When comparing their stories, students noticed significant similarities, highlighting the importance of maintaining personal judgment during the writing process. While they appreciated the efficiency of ChatGPT in content creation, some felt that the plot did not always unfold as intended or lacked coherence with their envisioned outcome.

This led to feelings of having "lost their voice," as the writing assistant at times took control over the narrative, rather than supporting it.

Ethical Concerns

Ethical considerations also emerged. The students did not reach a consensus on whether the creation of part or all of a text using such means is ethically appropriate. Some viewed it as a form of cheating, believing the final product was not entirely their own work, while others felt unconcerned, citing that they had received permission to use the tool.

Lack of Human Support

Some students missed the encouragement typically provided by teachers during writing tasks. They reported that in certain situations, they needed help that ChatGPT was unable to offer—possibly due to poorly formulated prompts. In such moments, they longed for collaborative interaction with either their teacher or peers. The absence of this classroom-based dynamic was seen as a significant drawback of AI, raising doubts about the tool's continued appeal over time.

Students' Perceptions of Appropriate AI Use in Creative Writing

Students' Attitudes

Most students evaluated their experience of writing with AI positively. At the same time, they expressed concerns about the risks of becoming overly dependent on the tool. For this reason, they emphasized the need for balanced and critical use. They also stressed the importance of a responsible and ethical attitude. According to them, ChatGPT should not dominate the learning process or become a new authority figure; instead, it should act as a supporter, facilitator or organizer. Moreover, its role should gradually diminish, allowing students to rely increasingly on their own abilities.

School's Role

The effective integration of AI into the learning process also requires acceptance and support from educators. Students rejected the notion of demonizing or banning the use of AI, recognizing that these tools are highly popular among young people. To ensure meaningful incorporation of AI into education, they argued that teacher training, clear guidance and targeted activities are essential. Acknowledging that their own knowledge is limited, they requested school-led instruction to establish a code of proper use and ethical guidelines for AI in the classroom.

DISCUSSION AND CONCLUSIONS

Artificial intelligence, having become a significant tool in both every day and professional life, is now claiming its place in the learning process. The present study found that most students are aware of AI tools, although not all are sufficiently familiar with them. Overall, the participants positively evaluated their experience with the writing assistant ChatGPT but also expressed concerns about the new risks that are emerging. This study explored the impact of artificial intelligence on creative thinking across three domains: cognitive, emotional, and pedagogical.

In the cognitive domain, an enhancement of creativity, critical thinking and problem-solving skills was observed. This finding aligns with previous empirical data indicating that AI support significantly contributes to content development, originality and flexibility (Treglia and Tomassoni, 2024; Woo and Guo, 2023; Woo et al., 2024). Moreover, it is consistent with studies suggesting that AI helps students overcome writing anxiety and create more complex storylines and characters (Guo et al., 2023; Kabeer et al., 2025). This study also found a positive effect on promoting language and literary literacy. Similar conclusions are drawn in earlier research where AI tools encouraged students to experiment and offered opportunities to revise and develop their narrative skills (Kabeer et al., 2025). Additionally, in studies examining AI's influence on language handling, greater ease was observed, particularly in learning English, along with a reduction in grammatical and syntactic errors and an expansion of vocabulary and content (Park, 2019; Guo et al., 2023; Lee et al., 2024; Wang, 2024). The current study adds two key benefits: understanding the importance of creating an outline before writing and addressing misconceptions related to difficult narrative concepts. Furthermore, the findings highlight the development of technological literacy. Various studies emphasize that AI familiarizes students with technological capabilities (Kabeer et al., 2025). Finally, this research, based on the theory of Mediation, found that ChatGPT can serve as supportive guidance, enabling students to work independently through most stages of writing and acquire new skills, thus advancing in their zone of proximal development. Many studies have shown that AI tools adapt the creative process

to each student's strengths and weaknesses, and through immediate feedback, they play a vital role in reflection (Wu, 2022; Doshi and Hauser, 2024; Kabeer et al., 2025).

In the emotional domain, this study, adopting Self-Determination Theory, found that AI can intrinsically motivate students by satisfying the needs for autonomy and competence. Students managed to overcome difficulties by solving problems and completing assigned tasks. Previous studies have shown that AI encouraged students to take responsibility for their learning. ChatGPT functioned as the fuel that drives creativity (Noy and Zhang, 2023). With its help, students shook off the constraints of traditional writing activities and found the freedom to experiment, pushing the boundaries of their creativity (Kabeer et al., 2025). Nevertheless, the study revealed an underlying fear among students about reduced autonomy if reliance on AI turns into dependence. According to Woo & Guo (2023), AI does not assist all students equally. A high-performing student critically evaluates AI suggestions, while a lower-performing student struggling with writing exercises may resort to copying. Thus, issues of ethics and academic integrity arise, as highlighted in previous studies (Kabeer et al., 2025). Moreover, the need for competence may remain unmet if students a priori consider ChatGPT infallible and simultaneously underestimate their own abilities. According to Rivera et al. (2025), AI involvement in the creative process enhanced the sense of competence among high-performing students because they had clear goals and viewed AI as a tool to realize their vision. In contrast, competence and, consequently, satisfaction decreased in lower-performing students who felt they lacked control over their work. Generative AI tools can reduce overall enjoyment, perceived value and the sense of uniqueness because students did not feel they invested time and effort in their creative endeavor (Norton et al., 2012; Rivera et al., 2025). Additionally, barriers may arise in satisfying the need for relatedness. The present study showed that the interaction between students and ChatGPT can become a cold transaction, rather than a meaningful exchange of views, as typically occurs in the classroom—a finding consistent with existing literature (Zimmerman et al., 2023). Thus, the results of this and previous studies suggest that using AI in the creative process may leave some basic psychological needs unfulfilled, which students usually meet through original and demanding work (Rivera et al., 2025).

In the pedagogical domain, the findings provide valuable insights into educators' attitudes toward integrating AI into the educational process. Specifically, our study highlights the importance of guided use of AI tools, in which students are trained to use prompts correctly and, more importantly, to interact critically with ChatGPT. Otherwise, the help provided by AI is ineffective and may amplify the frustration and discomfort that many students already experience in writing activities. This brings forth the question of to what extent educators in Greece are equipped with the necessary knowledge to support this new learning process. The significance of responsible AI use has also been underscored by other studies, which stress the necessity of equipping students with foundational skills —critical thinking, creativity and problem-solving—prior to the full integration of generative AI tools, along with the cultivation of ethical literacy (Kabeer et al., 2025; Rivera et al., 2025).

The findings of this study should be interpreted with caution, as the research was based on a small sample of students from a single educational setting. Future research should evaluate the perceptions of students from diverse geographic regions and educational backgrounds to obtain a more comprehensive picture. Moreover, this study relied exclusively on qualitative data provided by the students themselves, who may have been influenced by social expectations or may have recalled their experiences with generative AI inaccurately. This reduces the reliability and validity of the study. Lastly, the current research did not consider variables that might influence the use of AI and students' perceptions. Future studies could examine: a) the possible impact of gender, age, performance level and familiarity with technology; b) changes in student perceptions over time as their exposure to AI tools increases and c) the long-term impact on student performance. In conclusion, further research is needed to understand how generative AI can be better integrated into secondary education while minimizing potential risks. By exploring these areas, we can ensure that these technologies are used responsibly and effectively. This conclusion is also echoed by AI itself, which, when asked, responded: "ChatGPT can be a great assistant for inspiration, structure and editing, but the final narrative and emotion always belong to the writer!".

ABSTRACT

The integration and application of Artificial Intelligence in recent years has been on an upward trajectory, affecting key pillars of the global economy. Its dynamic course has not left education unaffected, on the contrary, today there is a strong interest in its exploration. This research is a bibliographic article through which existing studies are utilized, with the aim of examining artificial intelligence in the field of education and more specifically identifying both its advantages and disadvantages. It is considered important to explore the field under consideration through the presence of applications such as ChatGPT and Gemini, which are frequently used by trainees.

The research findings help members of the educational community and the respective bodies to assess the necessity of a smooth transition to a new normality, ensuring every ethical issue. The rational use of ChatGPT and Gemini is essential to maintaining the balance between the dual relationship of instructor and trainee.

For the needs of this scientific work, the researchers used secondary research through the literature, which refers to a systematic method of review and critique regarding the scientific field under consideration, helping to identify current knowledge, gaps and future research directions. A systematic search was carried out in reputable databases, libraries, electronic repositories and other scientific sources to collect research on artificial intelligence in education with the ultimate goal of evaluating its advantages and disadvantages.

Keywords: Artificial Intelligence, Education, ChatGPT, Gemini

INTRODUCTION

Educational technology significantly influences the way we teach, as its tools aid learning and skill acquisition. Today, artificial intelligence has been integrated into the educational process and teaching. It is used for the creation of educational content, interactive games, quizzes, automated grading and personalized teaching. It is observed through its presence, improvement in the quality and effectiveness of teaching and learning.

The educational process using artificial intelligence may be implemented either face-to-face or online in a virtual environment, in order to function individually and effectively (Sadiku et al., 2021). Additionally, artificial intelligence can even be utilized in administrative tasks within an educational unit, through the automation of grades, and the posting of results, as well as the grouping of large volumes of data (Lan, 2021). It is considered important to store data with fast, flexible and automated processes for the development of customized and personalized teaching.

However, there are strong concerns about the extent to which artificial intelligence can adhere to safeguards for various ethical issues. It is important to secure the personal data of the members involved in education. Another critical issue is whether artificial intelligence can replace the human trainer and what they offer (Fahimirad and Kotamjani, 2018). Moreover, another challenge is whether there can be impartiality by maintaining an attitude of respect for diversity and whether it refrains from prejudices when it is based on data with content that may contain prejudices (Latham et al., 2014).

The issue of artificial intelligence applications such as ChatGPT and Gemini in the educational process creates intense concerns, as there are learners who complete assignments or solve exercises without their own effort, as they literally rely on these applications. Their use is not prohibited and in the case that they use tools to seek additional information to understand more concepts and develop critical thinking and problem-solving skills, there is a positive impact.

However, in some cases, simple copying through keywords is observed, without the involvement of the learners to delve deeper into the educational content and the corresponding skills that can be acquired (Huttar and BrintzenhofeSzoc, 2020). Overall, all these issues of adopting artificial intelligence in education are worth examining, highlighting the impact of its application.

The purpose of this paper is to investigate artificial intelligence in the field of education and focus on its advantages and disadvantages. The second section presents the bibliography, the third the methodology, while the fourth presents the most important findings. The fifth section presents the conclusions, the sixth section presents the limitations and suggestions for further research, with the corresponding bibliographic references used in this scientific paper.

BIBLIOGRAPHICAL REVIEW

The integration of Artificial Intelligence in Education

Various definitions have been given for artificial intelligence, with most of them approaching artificial intelligence as a machine that thinks, understands languages and can solve problems. Artificial intelligence has the ability to perform tasks usually associated with intelligent beings (McArthur et al, 2005).

Early developers considered artificial intelligence to be a mechanical processing of logical statements, which defined human intelligence as the computation of various truth values (Hon, 2019). There is interdisciplinary nature in artificial intelligence as it is linked to philosophy, psychology, neurology, linguistics, computer science, and engineering science (Russell et al., 2022).

More specifically, Artificial Intelligence is the field of computer science that deals with the design and implementation of programs that mimic human cognitive abilities, displaying characteristics that are usually attributed to human behavior (Şeren and Özcan, 2021).

Artificial Intelligence is a mechanism to support face-to-face education, as instructors and learners are in the same space, while the Intelligent Educational System (IES) contributes to issues of teaching methods and techniques. However, the IES system itself can act as a support for the learner and suggest ways to enhance learning by assigning tasks to learners. A typical example of this application is the use of a supercomputer called Watson by a university in Australia (Zadrozny et al., 2015).

Artificial Intelligence is a means of delivering in-person education. Teaching is carried out by displaying animations on a screen or by an anthropomorphic robot or an IES with communication capabilities, where these actions may or may not be supervised by a human (Şeren and Özcan, 2021).

Artificial Intelligence as a means of simulating in-person education enables the instructor and the learner, when they are not in the same teaching space, to meet in a virtual environment (Şeren and Özcan, 2021).

The ChatGPT application

With the launch of OpenAI in 2015, ChatGPT began to emerge under its auspices (Sok and Heng, 2024). This venture was based on the assumption that the maturation of artificial intelligence into a more generalized intelligence depends on the development of sophisticated language models (Crawford, et al., 2023).

This application also had a great impact in the education sector, as many trainees used it as part of their daily duties in educational units. In particular, for the preparation of assignments and educational activities, ChatGPT was a point of reference that raised reasonable questions for teachers. More specifically, whether its use was rational and helped in understanding difficult concepts or whether it ultimately formed a framework that led learners to the easy solution without delving into the educational content and the educational process.

OpenAI in June 2018 marked a pivotal juncture, announcing the transformer architecture that used mechanisms to process human language with remarkable efficiency, thus laying the foundation for future developments (Adel, et al., 2024).

Following GPT-1 and GPT-2, GPT-3 was created in May 2020, marking a quantum leap in the series, combining advanced reinforcement learning with granularity methodologies to substantially improve performance, particularly through the emulation of sophisticated conversational interactions that closely mimic human speech (Adeshola and Adepoju, 2024).

ChatGPT, a derivative of these evolutionary models, has gained recognition in various fields for its human-like conversational capabilities. The culmination for ChatGPT was the public release of the API by OpenAI on March 2, 2023. GPT-4's capability has expanded beyond text analysis to advanced image recognition, allowing it to take on complex tasks, such as human analysis in complex legal analysis (Baidoo-Anu and Ansah, 2023). The most recent enhancement, GPT-4 Turbo, is designed to improve the user experience by enabling processing of up to 128,000 context tokens, facilitating the examination of voluminous documents, and the creation of exhaustive summaries (Memarian, B and Doleck, 2023).

ChatGPT, based on the GPT-4 architecture, is considered a central entity in the field of natural language processing. Her ability to interpret complex instructions and produce a wide range of creative results has solidified her position as an industry pioneer. With its proficiency in multiple programming languages and its ability to facilitate multilingual communication, ChatGPT is at the center of a significant leap in AI's ability to understand and reproduce human-like text (Opara et al., 2023).

However, today there are many challenges and concerns, as even scientific papers have been written with GPT-4 in which scholars cite this application as a source. It is understandable that some ethical issues are emerging in the educational and academic community that require thorough evaluation (Rahman and Watanobe, 2023).

The Gemini Application

Google DeepMind developed Gemini AI to perform complex tasks and produce high-quality code in a variety of programming languages. In the beginning its name was Bard and it provided the ability to simulate human conversation and communication through processing and machine learning.

Subsequently, it was developed, giving users the opportunity to understand and even recognize images or analyze complex graphs (Llerena-Izquierdo, 2024). The Gemini design is multimodal and over time its effectiveness has increased even further with additional multimodal data. Specifically, developers are able to use Gemini through API calls, or even through Google AI API, Vertex AI API. In its implementation, Gemini AI uses different data types which are merged with multiple algorithms in order to optimize performance.

One of its advantages is the ability for users to input images, audio, text, and other types of data, giving a result that is governed by more natural artificial intelligence interactions (Lee, et al., 2023). Gemini AI has been trained on a huge number of data, while having access to up-to-date information, providing accurate and reliable answers to the questions a user submits.

Additionally, due to its fast processing, it can and does perform many tasks and requests simultaneously (Imran and Almusharraf, 2024). However, in the field of education, it has been found that ChatGPT is more widely used. 4.

FINDINGS

The advantages of using artificial intelligence in education

Education is one of the areas in which artificial intelligence is used to improve the effectiveness of the educational process as it reduces the cost and time for the members involved.

Aligning education with technology is necessary to appreciate and recognize the value of using artificial intelligence and the capabilities it provides (Kamalov et al., 2023). Today, ChatGPT is one of the most popular artificial intelligence tools as it helps both the teacher and the learner depending on the respective level and goal setting.

Teachers can produce content for learners according to their preferences, desires, and class needs, either as text, video, quiz, or presentation (Li and Su, 2020). The range of possibilities is unlimited as teachers set the desired content as a command and ChatGPT then responds with the result, creating what was previously requested. The teacher then has the ability to optimize the result by setting parameters (Bahroun, 2023).

Moreover, there is the possibility of grading the difficulty level of the questions, or formatting the questions in open-ended, true-false or multiple choice. Interactive games, quizzes, assignments can also be produced and transform a lesson more fun and enjoyable. Learners can raise personal concerns in order to gain new knowledge (Misra et al., 2023).

It is noteworthy that the need for personalized learning can be met by artificial intelligence applications, as there is the possibility of customizing the needs of learners when creating content, making teaching more personalized with respect and adaptation to the profile of each learner (Nkambou, et al., 2018).

The automatic feedback provided enables immediate self-assessment by learners, strengthening their willingness to improve. Once their progress, preferences, the level of difficulty that suits them, and at the same time the teaching objectives are explored, the corresponding teaching content can be produced (Sharma et al., 2019). Consequently, the performance of learners improves, as they are provided with incentives to learn, resulting in them being more satisfied. Additionally, the participation of virtual assistants enhances the value of using artificial intelligence (Sollosy and McInerney, 2022).

Registration, scheduling, and course management, as well as data storage, are automated (Song and Shim, 2017). Employee errors that may have occurred due to repetitive tasks are now reduced, as is their implementation time. Consequently, the cost that would be attributed to the recruitment and employment of employees is also reduced.

Teachers save time in creating educational content, preparing teaching, and administrative tasks. In a broader context, the use of artificial intelligence can improve the effectiveness and efficiency of teachers and the educational process. Artificial intelligence also provides improved learning experiences by adapting and personalizing educational materials to individual needs (Chen et al., 2020).

At the same time, it reduces the time teachers spend preparing a lesson and carrying out necessary actions, reduces costs and encourages learners, while creating a sense of satisfaction from the lesson and improving learners' learning outcomes. Therefore, artificial intelligence has brought significant progress in education, while assisting the teacher in correction, material collection, lesson plan creation, personalization, and evaluation (Van der Vorst & Jelicic, 2019).

According to Zhang and Aslan, (2021) indicative advantages in education using artificial intelligence applications are the following (Table 1)

Table 1
Indicative Applications and Advantages of AI

Indicative Applications of AI	Advantages in Education
Chatbots	• Spark conversation • Increase learner interest and engagement
Specialized Systems	• Educational planning • Use of learning management systems • Improving the quality of interaction • Utilization of learning management systems
The intelligent teachers/agents	• Customized and timely learning materials, guidance and feedback • Personalized learning experience based on needs, preferences and prior knowledge-experience
Machine Learning	• Large-scale learner data analysis • Predictive models • Prevention and adaptation interventions
Personalized learning systems and environments	• Facilitating interaction • Improving distance learning • Personalized learning materials and resources for personalized learning
Visualizations and virtual learning environments	• Collaborative learning, engagement and visual feedback • Visualization of information • Learning environments that stimulate multiple senses

Source: The Benefits of AI, adapted from Zhang and Aslan, (2021)

The disadvantages of artificial intelligence in education

A critical issue regarding the use of artificial intelligence in education is the ethical framework, which should be fully consistent with the general principles governing education.

The main ethical concerns are data privacy, security and avoiding a potential misuse of personal information. Ensuring responsible and transparent practices is crucial, as users, even if they give consent for the use of their data, are not completely sure throughout the process (Şeren & Özcan, 2021). Ensuring human rights, respecting, protecting and accepting diversity and therefore inclusion are crucial. Prejudice should be kept out of artificial intelligence.

Artificial intelligence systems learn from historical data, so if the data used for education contains biases, AI can perpetuate them, or even exacerbate them. In education, this could lead to inequality of opportunity and outcomes, especially for marginalized groups. Transparency is a prerequisite for ensuring human rights are respected and protected. Additionally, AI systems rely on algorithms to provide personalized learning experiences, however, these algorithms may not fully understand the individual needs and learning styles of learners.

Humans, as social beings, learn by participating in a group of people, and despite the integration of technological advancements in education, it is doubtful that there is a need for balance in the level of its use, as what the teacher offers may not be able to be replaced by artificial intelligence tools (Edwards & Cheok, 2018).

The aspect of alienation is important, as human contact, the cultivation of emotional intelligence is reduced. However, the integration of artificial intelligence in education requires a significant level of technological infrastructure. The inability to access the necessary devices and high-speed internet can create a technological gap and lead to the marginalization of certain groups (Fahimirad & Kotamjani, 2018).

The implementation of artificial intelligence requires teachers and learners to acclimatize to new technologies and modern teaching methods. This transition can be a challenge for some, but the lack of the required know-how can be an obstacle to the efficient use of various applications of artificial intelligence (ChatGPT Gemini AI etc.). In some cases, the use of artificial intelligence in education also entails limitations on creativity and the development of critical thinking.

Specifically, artificial intelligence systems are characterized by repetitive and structured tasks, for this reason there is a risk that the enhancement of creativity and critical thinking will not be achieved (Grace et al., 2018).

CONCLUSIONS

Educational technology is developing, enriching and making education more qualitative and more effective. The tools that teachers have the opportunity to use are varied. In addition, the integration of artificial intelligence brings multiple benefits, both to the teacher and the learner.

The support of the teacher by automated tasks performed by artificial intelligence enhances teaching, as it enables the educational material to be adapted to the modern needs of the trainees. In this way, the educational process becomes more efficient and qualitative, offering an exciting learning experience. The time saved allows the teacher to enrich his teaching and reduce the cost of the educational unit.

The integration of artificial intelligence in education also improves teacher effectiveness and efficiency, while promoting personalized learning with the interactive content it provides. The results of the use of artificial intelligence in education are evident in administration, teaching, and learning outcomes.

Automated systems provide economic benefits and offer more quality time to the involved members of the educational process, in order to develop advanced digital skills. Human connection and empathy play an important role in education, however, it appears that artificial intelligence does not enhance this issue.

In a broader context, accepting and managing these limitations requires a considered and careful approach to integrating artificial intelligence into education, to ensure that the role of the teacher is supported, but not replaced, while enabling equitable and inclusive educational opportunities.

This research is secondary through the examination of other researchers' research, resulting in an extremely limited methodology. More specifically, the researchers propose conducting a more extensive study. This research in the future is likely to be of a primary quantitative, qualitative or mixed nature in order to triangulate the results.

The field of artificial intelligence provides the opportunity even for young researchers to conduct research in order to confirm or compare these results with corresponding studies and to draw more secure conclusions. Artificial intelligence on the educational map is evolving rapidly and the scientific investigation of critical issues raised through this research is vital, in order to examine its integration into the educational process more holistically for a more sustainable future.

ABSTRACT

The rapid advancement of Artificial intelligence (AI) has brought significant changes to the use of digital media in everyday education, introducing numerous opportunities as well as challenges that require further exploration regarding AI's role in teaching and learning. AI-powered tools are reshaping pedagogical approaches by enabling personalized learning experiences, intelligent teaching systems, and adaptive assessments. However, these developments raise concerns about data privacy and ethical dilemmas.

In Cyprus, the integration of AI into the educational system remains at an early stage, despite the growing desire and strong interest in improving teaching methods. This research examines both the perspectives of the global educational community and the level of familiarity of Cypriot educators in primary, secondary, and higher education regarding the potential integration of AI into the educational landscape. The questionnaire, completed by the stakeholders, highlights perceptions regarding the concept of AI, the level of familiarity with AI tools, the emotions triggered by a possible integration, and the degree of willingness to adopt AI in educational environments. Additionally, it includes questions about the advantages and disadvantages of AI tools in education. It is worth noting that many educators are concerned about whether the appropriate infrastructure for integrating such tools into educational settings currently exists or how soon it could be developed. Moreover, most educators wish to have the right to accept or reject AI integration, as they are the direct transmitters of knowledge.

The adoption of AI tools requires the proper preparation of educators, which underscores the urgent need for seminars and conferences where educators can share their perspectives, experiences, and concerns. The insights obtained from this research contribute to the broader dialogue on digital transformation in education, outlining strategic directions for the responsible and effective integration of AI into the educational system.

Keywords: AI in education, adaptive learning, Cyprus education system, global educational community, AI integration benefits, AI anticipated challenges

INTRODUCTION

AI is increasingly becoming part of everyday life, including the field of education, where it holds the potential to transform teaching and learning. This research explores the significance of AI in the education system, with a specific focus on its potential integration in Cyprus' schools and universities. Education, defined as the transfer of knowledge, skills, and values, has evolved significantly over time, just as AI—defined as the simulation of human intelligence by machines—has advanced through innovations. As AI tools become more prevalent, they raise both opportunities and ethical concerns within educational contexts. This study investigates the perspectives of educators in Cyprus across all educational levels, examining their familiarity with AI, existing infrastructure, and attitudes toward its integration. It also compares global trends with Cyprus' current position and identifies key steps needed for effective and responsible implementation of AI in the local education system.

RESEARCH QUESTIONS

This research focuses on three main questions:

1) How is the educational community preparing for the use of AI tools in educational environments?
2) To what extent has AI been integrated into Cypriot education system across primary, secondary and tertiary education?
3) What are the anticipated impacts of AI integration on the overall educational environment?

LITERATURE REVIEW

The traditional "one size fits all" approach to education has come under increasing criticism for failing to address the diverse needs of individual students (Patrick, 2017). Many countries, like the United States and China, have adopted AI tools to enhance learning, increase student engagement and offer more personalized teaching. The concept of personalized education is inspired by "precision medicine," where treatment is tailored based on individual data. In education, this means analyzing learning behaviors and outcomes to predict student performance and offer timely feedback. The objective is to prevent learning gaps and optimize learning strategies for each student.

A prominent example of AI tools is *Knewton*, which was launched in 2008 and offered AI-powered adaptive learning platforms that create content based on individuals' needs. In 2016, the company also began developing courseware for higher education classes using content from educational companies and open educational resources. Knewton technology enables the company to perform sophisticated, real-time analysis of reams of student performance data. It uses adaptive learning technology to identify each student's particular strengths and weaknesses. Concepts are tagged at very specific levels, which allows the platform to make custom recommendations based on students' proficiency and needs.

Another typing assistant is *Grammarly*. Grammarly was founded in 2009, and the company initially offered a subscription-based product intended to help students improve their grammar and spelling. That product was subsequently developed into a writing assistant that checks the grammar, spelling, and tone of a piece of writing. In 2019, Grammarly added a tone detector to its writing assistant. This tool uses set rules and machine-learning to help users gauge the character of their writing and tailor it to a particular audience. In April 2023, it launched a product using generative AI built on the GPT-3 large language models. The software can generate, and rewrite content based on prompts. It can also generate topic ideas and outlines for written content such as blog posts and academic essays. It has been trained on an anonymized library of business writing and is capable of suggesting clarifying edits and additions to work communications such as emails and chat messages.

A famous application for students in China is *17zuoye*. It was founded in 2011 and is based in Beijing. It is an online platform focused on digital learning. The company offers digital educational resources and services, including a homework solution that aligns with textbook curricula and is enhanced by big data analytics. 17zuoye serves the education sector, providing tools and content for teachers, students, and parents to support learning progress. M-learning, a key subset of AI, is growing at a rapid pace in India as more and more institutions, teachers and students use online platforms for study. Indian teachers use both traditional and modern strategies for teaching. Blended learning which uses both conventional and modern strategies is gaining in popularity. The teachers of modern day are expected to have the technical know-how of using modern classroom technologies. Slowly but steadily, Indian classrooms are becoming smart. Students are trained in information technology right from the primary level. As the internet and allied technologies are getting cheaper and more widespread, more students can lay their hands on m-learning.

Byju's is one of the most important players in the Indian education system. Byju's, the Indian edtech company, was founded in 2011 by Byju Raveendran and Divya Gokulnath. The mobile application was launched in 2015. They provide a host of services like aid for competitive exam preparation, school-level study materials and home learning programs. Byju's, one of the most valued edtech companies in the world, has played a major role in transforming Indian education scenario. The company has raised investments from big players like Chan-Zuckerberg Initiative, Tencent, Lightspeed Venture and Sofina. The company is expected to grow more as it now caters to an international audience. Byju's App, one among the M-Learning apps, helps study difficult subjects by making concepts easily comprehensible. The app uses a host of modern techniques like web-based learning, visual graphics, video-based instruction, etc. to provide an immersive learning experience. These innovations are highly helpful for the students to understand basic concepts and enable them to prepare for exams.

Socratic is an education tech company that offers a mobile app for students. Socratic was first launched as a web product in 2013 by Chris Pedregal and Shreyans Bhansali, in New York City, United States. They launched their app under the same name in 2016. In March 2018, Socratic was acquired by Google for an undisclosed amount. The acquisition was made public in August 2019, when the Founder and CTO (now engineering manager) Shreyans Bhansali announced that the company had joined Google. The Socratic app utilizes AI to accurately predict which concepts will help a student to solve their questions. The app works by letting students take a photo of homework questions. Using Optical Character Recognition (OCR), the app is able to read the photo and classify it. Students receive various "cards" in the app with different learning resources such as definitions, YouTube videos, Questions & Answers. It covers subjects like math, chemistry, physics, biology, history, psychology, anatomy and astronomy. It provides step-by-step explanations and helps students to solve various exercises without the assistance or guidance of parents or teachers.

In China many AI-powered applications are transforming the educational landscape, one of the first commercial adaptive learning systems in mainland China being *Squirrel AI*. Squirrel AI is an international educational technology company that specializes in intelligent adaptive learning and was one of the first companies in the world that offered large-scale AI-powered adaptive education solutions. Squirrel AI was founded by Derek Haoyang Li in 2014. It became popular among schools in China and during the coronavirus period it was considered a powerful tool for students' learning, as students were required to stay at home and schools were closed in almost all provinces in China. Squirrel AI Learning works with teachers to identify the most fine-grained possible concepts ("knowledge points") for a course in order to precisely target learning gaps. For example, middle school mathematics is broken into over 10,000 points such as rational numbers, the properties of a triangle, and the Pythagorean theorem. Each point is linked to related items, forming a "knowledge graph" which is addressed by videos, examples and practice problems. Each student begins with a diagnostic test to identify where to begin their learning. The system continues to refine its graph as more students proceed. Learning is not student-directed. The system decides the order of topics. Squirrel AI delivers personalized learning and helps students with their weaknesses.

GoGuardian is an educational software company founded in 2015 and based in Los Angeles, California. GoGuardian is widely used in U.S. schools, particularly for monitoring and managing students' online activity. The platform is designed to help teachers and administrators ensure that students are staying focused on educational content during class, whether they are in a physical classroom or participating in remote learning. Teachers have the opportunity to guide students to safe and specific resources during their lessons, as GoGuardian blocks inappropriate or non-educational websites. It is worth noting that in August 2018 GoGuardian launched Beacon, a software system that analyses students' browsing behaviour and can alert teachers about students at risk of suicide or self-harm.

One of the most widespread conversational chatbots is *ChatGPT*. It is a generative AI chatbot developed by Open-AI and launched in 2022. ChatGPT uses natural language processing to generate human-like conversational responses and enables users to refine and steer a conversation towards a desired length, format, style, level of detail, and language. Since its maiden release into the public domain on November 30, 2022, it garnered more than one million subscribers within one week. By January 2023, it had become the fastest growing consumer software application in history, gaining 100 million users in 2 months (Lo, 2023). The website's design concept is quite simple. Users can create an account, log in and type their questions. Within seconds, the chatbot generates bodies of texts in response and users have the ability to instruct the chatbot to modify or regenerate the response. ChatGPT can provide writing assistance to students by suggesting ideas for academic papers. Explanations can be given to homework exercises as ChatGPT breaks down a complex problem into simpler terms and provides step-by-step guidance to students' questions. One of the most useful abilities is translating an assignment into a student's native language. This means that students from foreign countries can be integrated into classrooms more easily. Also, it is a powerful tool for coding, especially for computer science students. It can help debug code and explain programming concepts. It can serve as a virtual assistant to enhance students' performance. ChatGPT's ability to facilitate collaboration by generating different scenarios for students to work collaboratively in group activities is worth noting. It can provide a discussion structure, real-time feedback and

personalized guidance to facilitate group discussions and debates. It is a virtual tutor that gains more interest in its abilities from students. Moreover, it can be a powerful and useful tool for educators and teachers as it can generate exercises, quizzes and scenarios for students' assessments.

Khanmigo is a generative AI tool developed by Khan Academy and powered by OpenAI's GPT-4. Though it was not originally designed as a language learning tool, it has capabilities that support autonomous learning, including reading and writing in various subjects. Khanmigo's key features include structured tutoring interactions, writing support, debate simulations, and creative chat with fictional or historical characters (Shetye, 2024). The system guides students toward answers rather than giving them outright, aiming to simulate the role of a thoughtful tutor. In terms of language learning, Khanmigo provides opportunities for meaningful text-based interaction and contextualized output. However, the tool may not be suitable for all learners, particularly beginners, as the complexity of the language used can be a barrier. Furthermore, while it offers text-to-text interaction and vocabulary explanation, it currently lacks speech recognition or pronunciation practice features for languages, like French. Its strength lies in its ability to foster critical thinking and exploration across disciplines, but its application in structured language acquisition is limited by the absence of focused linguistic scaffolding and speech features.

Quizlet is a digital learning application designed to reinforce knowledge through flashcards, quizzes, and game-based learning (Anwar, 2025). Quizlet has been shown to significantly improve both students' critical thinking skills and their learning outcomes. A study conducted on students at a religious school in Indonesia found that using Quizlet led to notable gains in the students' abilities to analyze, evaluate, and synthesize sentence structures, especially when learning about grammatical components. Before using Quizlet, students struggled with grammar and exhibited low engagement due to traditional, lecture-based teaching methods. Quizlet changed this dynamic by making the learning process more interactive, visually engaging, and student-centered. The tool was particularly effective in boosting vocabulary retention and making grammar instruction more approachable. While Quizlet is not built specifically for in-depth language exploration or conversation practice, it excels in foundational skill-building and provides a strong platform for vocabulary acquisition and grammatical understanding.

Duolingo is a globally popular online language learning platform known for its innovative use of technology, gamification, and accessibility (Kazu, 2025). Offering courses in numerous languages including Spanish, French, German, and Italian, Duolingo appeals to a wide demographic through its engaging and user-friendly interface. The platform adopts a gamified approach to learning, incorporating features such as points, badges, and instant feedback to motivate users and enhance retention. Lessons are modular and compact, focusing on building proficiency in reading, writing, listening, and speaking. Its adaptive learning algorithm customizes lesson difficulty based on user performance, creating a personalized learning experience. Duolingo also supports interactive peer engagement, allowing users to track their progress, revisit completed courses, and participate in community-based learning. Although widely embraced for its convenience and inclusiveness, ongoing research is exploring its effectiveness for specific age groups, such as high school learners. Nevertheless, Duolingo remains a leading example of how educational technology can democratize and enhance language learning on a global scale.

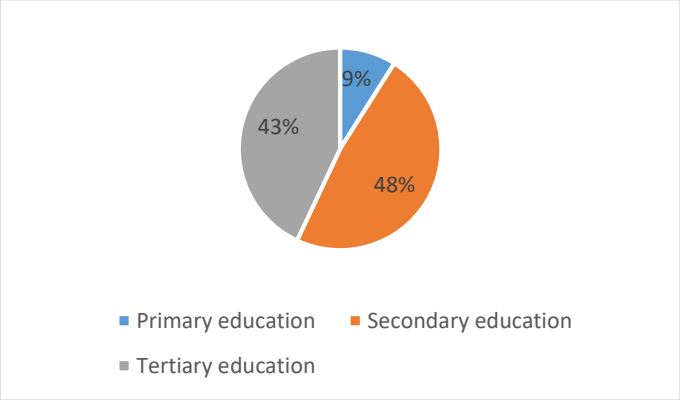
In Cyprus, AI adoption remains limited and is at early stages. A private initiative called ***AInstein*** was introduced in 2023 (Reuters, 2023). The educational robot speaks in a North American accent, tells jokes, attempts to speak Greek and advises on how Albert Einstein's theory of relativity can be taught in class. Students seem to be enthusiastic about this robot and tutors declare that the ultimate purpose is to incorporate it into their teaching routine. To this direction, the Ministry of Education in Cyprus has recently announced plans for training and infrastructure development (Michaelidou, 2024). These examples highlight the global momentum of AI in education and Cyprus' early steps toward embracing this transformation.

THE QUESTIONNAIRE

The questionnaire used in this research was distributed to educators across Cyprus with the goal of assessing their awareness and understanding of AI and its possible application within the educational environment. It aims to identify the potential benefits and anticipated drawbacks of integrating AI tools into classrooms, as well as to evaluate the current level of infrastructure. The questionnaire involves demographic questions, as well as it contains questions focused on perceptions and personal experiences.

It is obvious that the majority of respondents are employed at the secondary and tertiary levels of education (Figure 1). The dominant age group falls between 31 and 42 years old, followed by those aged 43 to 54 (Figure 2). This demographic trend suggests that most participants belong to younger age and middle-aged groups, who are generally more accustomed to using technology.

Figure 1
Educational level of participants



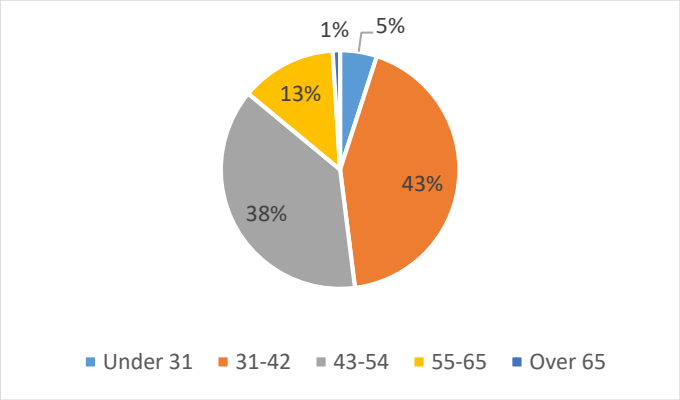


Figure 2.
Age of participants

The research explores how the educational community perceives the concept of AI within educational settings and examines participants' familiarity with it. According to Figure 3, more than half of educators report having a basic understanding of AI. Notably, 22% indicate they are very familiar with the concept, while only 1% specialize in the field. Meanwhile, 13% of educators state they are not familiar with AI at all. These findings suggest that although AI is a widely discussed topic, many educators have yet to engage with it meaningfully. This highlights potential barriers to AI adoption in education, primarily due to a limited depth of understanding, and underscores the need for targeted training programs and seminars to keep educators informed about current trends and developments in AI.

Figure3
Familiarity with the concept of AI

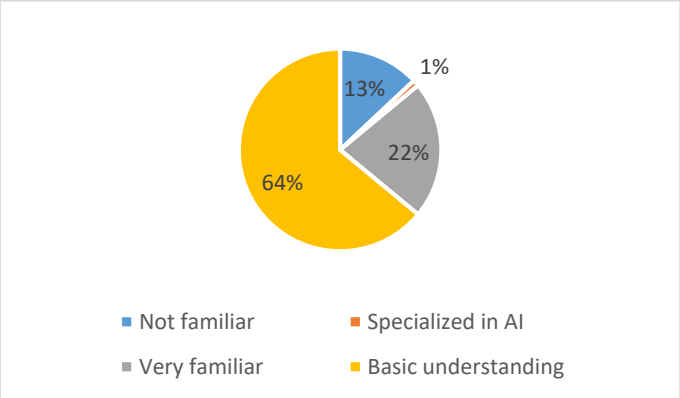

Figure 4 addresses responses to the question, “What is AI for you?”, revealing a range of perceptions among participants. Some respondents describe AI as powerful computing tools capable of processing large volumes of data and performing complex tasks efficiently. Others characterize AI as clever or intelligent machines that can mimic human reasoning or problem-solving abilities. A portion of the participants associate AI primarily with robotics, viewing it as the simulation of human-like behavior through machines. Meanwhile, another group sees AI as a set of automated procedures designed to perform tasks without human intervention. These varied interpretations highlight the diverse understandings of AI among educators, reflecting both technical and conceptual perspectives.

Figure 4
What is AI for you?

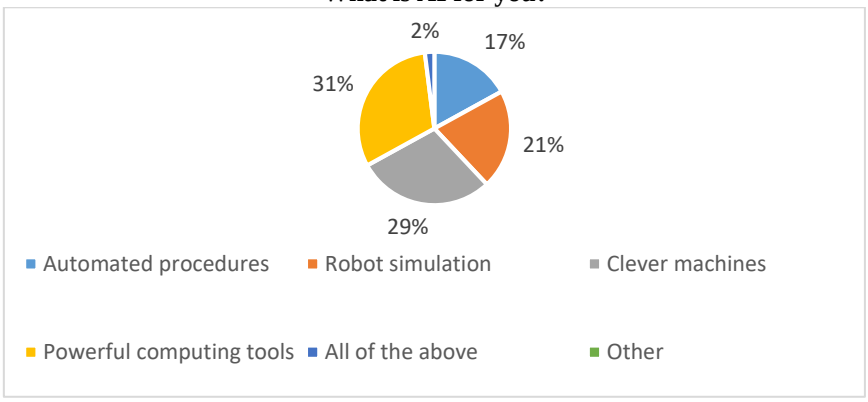

Figure 5 explores educators' feelings and emotional responses toward the use of AI tools in educational contexts. While most of participants express enthusiasm and optimism about the potential of AI enhancing teaching and learning, others report feelings of insecurity, uncertainty, and even anxiety. These mixed emotions are understandable, especially given the rapid pace at which AI technologies are evolving and being introduced into the educational landscape. For a large number of teachers, anxiety stems from a lack of sufficient knowledge or training on how to effectively utilize these tools within their specific teaching practices.

Figure 5
Feelings about AI tools.

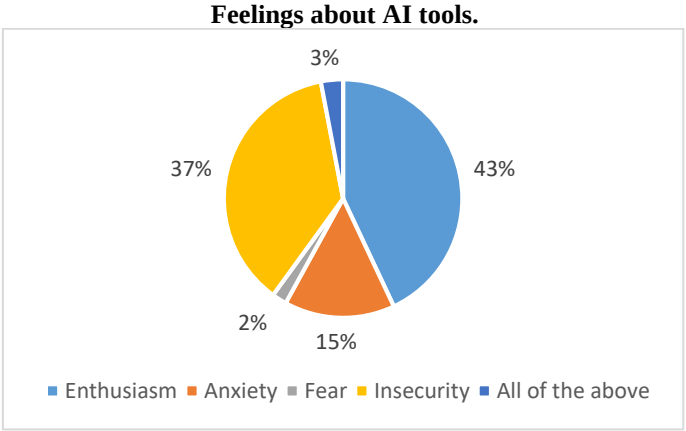

Figure 6 illustrates that educators recognize a range of significant benefits arising from the integration of AI into the educational process. Among the most widely acknowledged advantages is the potential for AI to enable more personalized learning experiences. Through adaptive learning systems, AI can tailor educational content to match individual students' pace, learning styles, and areas of difficulty. Educators also point to increased student motivation as a major outcome of AI-supported learning environments, particularly when interactive platforms are employed to stimulate interest and active participation. Another notable benefit is the early identification of at-risk students, which are considered more likely than their peers to experience academic failure. AI systems can monitor learning patterns, detect signs of struggle, and alert educators to intervene promptly with targeted support, potentially preventing long-term academic setbacks.

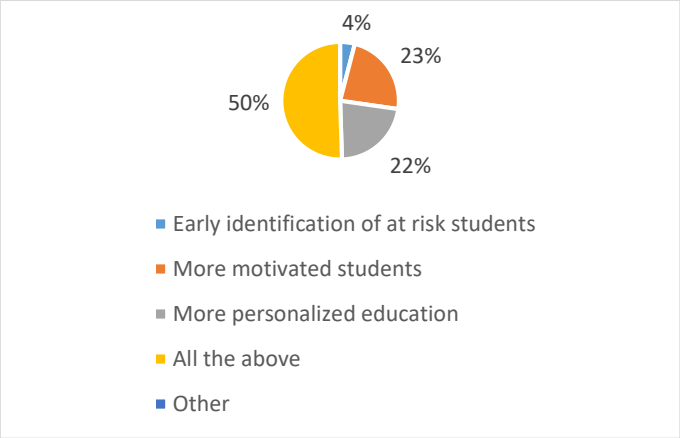
However, Figure 7 reveals a parallel set of concerns among educators, underscoring the complex and often ambivalent attitudes toward AI in educational contexts. A primary worry is that increased reliance on AI might lead to a decline in students' critical thinking skills. With easy access to AI-generated answers and solutions, there is a risk that students may become passive consumers of information, rather than active problem-solvers who engage in analysis, reflection, and independent thought. Moreover, educators are apprehensive about the potential for AI to obscure or diminish the teacher's role. While AI can support instructional delivery, it cannot replicate the human connection, mentorship, and emotional support that teachers provide. If students begin to perceive AI as the primary authority, there may be a failure to appreciate the expertise and importance of educators. Additionally, practical limitations such as budget constraints present significant barriers to equitable AI implementation. Schools and universities with limited financial resources may be unable to access, maintain, or effectively integrate AI technologies, potentially widening the digital divide and exacerbating educational inequalities.

Figure 6
Benefits of using AI tools



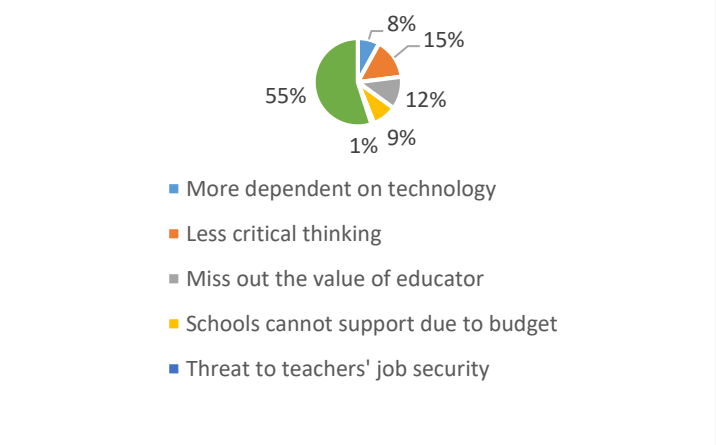


Figure 7
Side effects of using AI tools

Although nearly half of the educators have not been informed about AI tools and their possible use in the education system (Figure 8), most of them may seem willing to integrate AI tools and adjust their teaching method (Figure 9).

Figure 10 reveals that 83% of educators desire to have the right to accept or reject AI tools in their classrooms. Allowing them to have the right of acceptance or rejection respects their professional autonomy and judgement. Moreover, letting them use AI tools when they feel ready can lead to better learning outcomes.

Figure 8.
Have you ever been informed about AI tools and their possible use in education system?

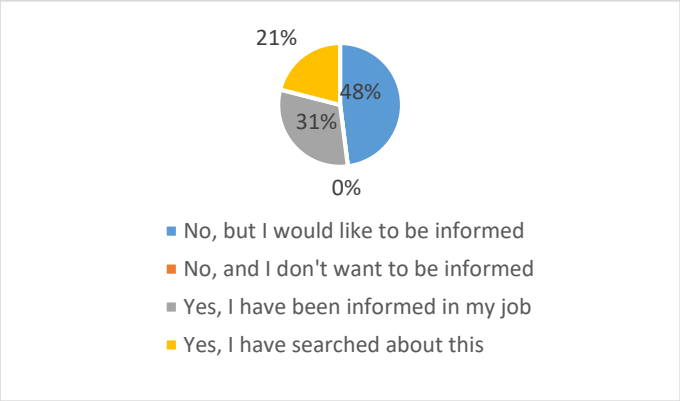

Figure 9
Willingness of adjusting teaching methods to integrate AI tools in classrooms

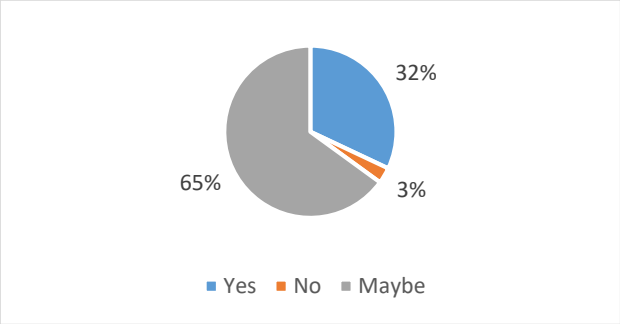

Figure 10
Do you want to have the right to accept or reject AI tools in education?

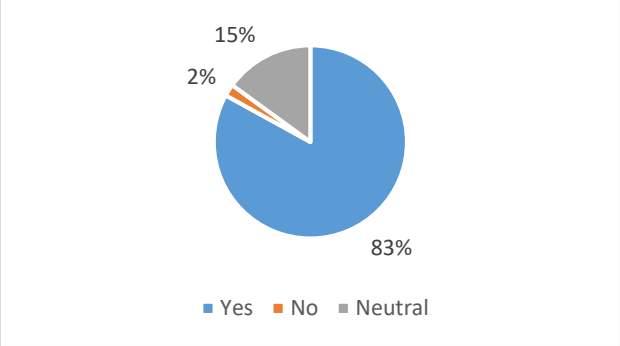

Figure 11
Appropriate infrastructure in Cyprus to integrate AI tools

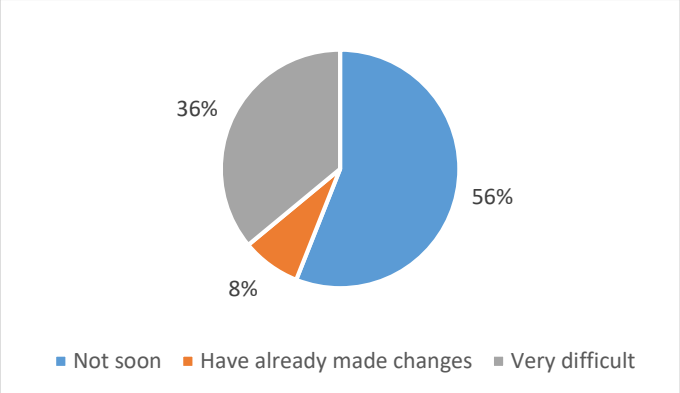

Figure 11 makes it clear that only a small percentage -specifically 8%- of educators supports that Cyprus has already made changes in its education system for a possible integration, while most of them state that it is quite difficult, or it will not happen soon enough. These findings highlight a prevailing sentiment of uncertainty and concern about the pace and feasibility of educational reform in Cyprus in relation to integration efforts.

CONCLUSIONS

This research aimed to assess educators' awareness, perceptions, and readiness for the integration of AI tools in the educational landscape of Cyprus. The findings reveal that while most educators possess a basic understanding of AI, only a small minority are highly familiar or specialized in this field. This aligns with the literature review, which indicates that Cyprus is still in the early stages of AI adoption in education, as demonstrated by the recent introduction of the AInstein initiative. In contrast, countries like the United States, China, and India have already incorporated advanced AI tools—such as Knewton, Squirrel AI, Byju's, and Socratic—into their education systems, leading to more personalized learning, improved student motivation, and timely identification of at-risk students.

The results of the questionnaire mirror global findings in the literature regarding the perceived benefits of AI, particularly its role in personalizing education, enhancing student engagement, and offering early intervention for students at risk of academic failure. This is consistent with the capabilities described in AI tools like Knewton and Squirrel AI, which analyze student performance to tailor learning paths. Similarly, educators in Cyprus recognize AI's potential to foster motivation through interactive and adaptive learning environments, a benefit also highlighted in studies of platforms like Byju's and Quizlet.

However, the research also uncovers concerns that echo the challenges discussed in literature. Teachers worry about the potential reduction of critical thinking skills among students and the possibility that AI might undermine their professional roles—concerns also raised in global discussions about AI in education. Additionally, practical barriers such as limited infrastructure and financial constraints are particularly pronounced in Cyprus, further slowing the adoption process compared to more technologically advanced countries.

Despite these concerns, most of the educators express openness to adopting AI tools, provided they have the autonomy to decide how and when to implement them in their classrooms. This willingness reflects a global trend where teachers see AI as a supportive tool rather than a replacement for their roles. Nonetheless, the findings strongly indicate that without targeted professional development, infrastructure investment, and supportive policies from the Ministry of Education, Cyprus will struggle to fully benefit from AI's transformative potential in education.

In conclusion, the study highlights a gap between the global advancement of AI in education and Cyprus's current readiness. Bridging this gap will require coordinated efforts to provide educators with training, resources, and autonomy, ensuring that AI serves as a complement to human teaching rather than a substitute.

PERCEPTIONS OF FUTURE EDUCATORS REGARDING THE UTILIZATION OF ARTIFICIAL INTELLIGENCE IN EDUCATION

Bassounas Athanasios
Educational Consultant in Informatics
Directorate of Secondary Education of Ioannina
e-mail: basounas@sch.gr

ABSTRACT

The utilization of Artificial Intelligence (AI) is one of the main fields of interest in the recent years, for both educators and educational researchers. The present study explores the perceptions of future educators regarding the potential of AI for both teachers and students, the challenges and risks associated with its use and the conditions necessary for the effective and beneficial integration of AI into all aspects of the learning process. The research was conducted among students of the Annual Pedagogical Training Program (E.P.PAI.K) of the Higher School of Pedagogical and Technological Education (A.S.PAI.T.E.), representing various fields and with various levels of teaching experience. These students are potential future educators in Primary and Secondary school education. Data collection was carried out using an anonymous online questionnaire with both closed (Likert scale) and open-ended questions. The questionnaire gathered demographic data, information on the technological proficiency of the students, their familiarity with digital technology and AI and its applications, their opinion regarding the use of AI by teachers and students and the consequences it may have and, finally, the prerequisites for effective and safe utilization.

The research findings indicate that the future educators are highly familiar with digital technology and particularly AI and they often use AI applications. They believe that AI can support educators in lesson planning, development of instructional material and as a means to attract and engage their students' attention. They also acknowledge that AI can be beneficial for students (to a lesser extent compared to teachers), mainly in familiarization with technology and knowledge acquisition. However, the participants of the study recognize risks and challenges associated with AI integration in education. A significant proportion of the respondents expressed their concern about that fact that AI could hinder and diminish students' critical thinking skills, as well as fostering dependence on technology and isolation from authentic human interactions. Other risks are plagiarism and intellectual property violation. Moreover, most future educators fear that AI might diminish the role of the teacher. Finally, nearly all future teachers emphasized the necessity of establishing clear policies for the ethical and effective use of AI in education. They also strongly advocated for systematic training and ongoing support to equip educators with the skills required in this evolving technological environment.

INTRODUCTION

The use of Artificial Intelligence (AI) in the learning process, in every level of education, is one of the most important topics of interest in educational research both in Greece and internationally (Forero-Corba and Bennasar, 2024; Yim and Su, 2024; Wang et al., 2024). A large number of seminars and training programs are organized by universities and other institutions, aiming to support educators in the use of AI applications and tools. Many teachers are exploring the potential of AI to facilitate and improve their tasks. At the same time, even those who are not positive to the use of AI, acknowledge that their students are already using AI in various ways and feel that they themselves cannot be distant from these developments. Nevertheless, even teachers who are positive and active with AI, still have concerns about the impacts and problems it may create and they consider both ongoing teacher training and implementation of good practice rules necessary for the use of AI tools in education. This study explores the perceptions of students of the Annual Pedagogical Training Program (E.P.PAI.K) of Higher School of Pedagogical and Technological Education (A.S.PAI.T.E.) regarding these issues, as the new reality created by the spread of AI in education is one of the major challenges they are expected to face in the future. Moreover, as future educators, they will be called to play a particularly significant role in relation to this new form of literacy, that is emerging globally in a very rapid pace.

THEORETICAL FRAMEWORK

Artificial Intelligence and specifically Machine Learning (ML) have experienced rapid development and expansion in the last few years and education is one of the fields with active involvement in adoption and utilization of its applications. Machine Learning is a branch of AI which focuses on systems that learn from data, while AI includes the creation of systems that can operate autonomously. In the context of educational research, the term Artificial Intelligence typically encompasses AI and ML, as both aim to create systems that can perform tasks in a "human-like" manner. They both rely on mathematical and statistical techniques for data processing and analysis (Forero-Corba and Bennasar). In the present study, the term Artificial Intelligence will be used inclusively to refer to both AI and ML.

Utilization of AI tools in Education

Various tool and applications of AI have been used in education (Stancovic et al., 2024), some of them being general-purpose and others specifically designed for the needs of education. Large Language Models (LLMs – also referred to as chatbots) such as ChatGPT, Gemini, DeepSeek and others are the most commonly-used and well-known general-purpose AI tools. These models are designed to interact with humans through conversation, providing answers to questions, performing tasks such as summarizing text, translation and generating multimodal content according to the user requirements. Another category includes tools that generate images and designs based on user text prompts (Midjourney, NightCafe, Leonardo.Ai, BlueWillow, Canva etc.). Many educators also use AI applications for video creation and editing (Pictory, Sora, Reed.io, Lumen5 etc.) and applications for music composition (Aiva, Suno AI, Voicemod, Soundful etc.). Apart from general-purpose applications, there are education-oriented platforms such as the MagicSchool AI suite (https://www.magicschool.ai/), which offers tools for lesson planning, tools to create quizzes, worksheets, rubrics, embed questions in educational videos and many more. Many teachers use tools to create tests and assignments, prepare student feedback, correct projects etc. Kwid, Sarty and Yang (2024) categorize educational AI tools into three types: instructional, administrative and analytical. Instructional tools are used to improve the quality of the education provided to students. They include resources for personalized and differentiated teaching, feedback tools, learning management applications etc. Administrative tools assist teachers to create lesson plans and assessments and they offer automatic correction and grading functions. There are tools for monitoring student behavior and performance, facilitate communication with parents and manage other time-consuming administrative tasks. Finally, analytical tools can process student data to predict students' learning paths and even suggest personalized interventions. Tools like MagicSchool may incorporate features form all three categories.

The research conducted by Daskalaki, Psaroudaki and Fragopoulou (2024) involving 1754 educators in Greece and four other countries showed that AI is mainly used to support teachers' work and to engage students actively. Teachers believe that AI could be valuable in personalized learning. ChatGPT, the most well-known AI tool was used by Athanassopoulos et al. (2023) to improve foreign language writing in multilingual and multicultural classrooms, specifically with students with refugee/migrant backgrounds who often face additional language difficulties. The study involved eight 15-years-old students of a Greek junior high-school. At first, students wrote a test, which was then improved by ChatGPT in terms of vocabulary and grammar. Next, the students produced a new text, according to the model's corrections. The ones who used ChatGPT showed improvement in vocabulary and grammar and produced written work of higher quality. Tsiotakis and Spanirriga (2023) explored the use of ChatGPT for peer assessment and feedback of student essays. They found that students were able to distinguish the model's evaluation and feedback from the one provided by their classmates and they believed that it was more comprehensive and well-reasoned, while also recognizing

AI's potential to deliver personalized and effective feedback. Educators of primary and secondary education primarily use AI to assist them in text production and also in the production of digital content such as images, audio and video (Galindo-Domínguez et al., 2024). A study by Xing et al. (2025) showed that AI tools and especially LLM's such as ChatGPT, are used for the analysis of student responses, as assistant of students of special needs, in the automated generation of educational content and for providing feedback. Alier, García-Peñalvo and Camba (2024) found that generative AI supports personalized teaching and learning, enabling adaptive content, quizzes, assignment and assessments and new ways of student evaluation, reducing the teachers' workload.

Issues and concerns arising from the use of AI in education

AI use in education may offer potentials and opportunities, but it is also accompanied by concerns and challenges regarding its effectiveness in improving education and also risks and dangers. A study in Greek foreign language teachers (Varsamidou, 2024) revealed their cautious attitude toward the use of AI, as they believe that it hinders the development of students' critical thinking and creativity, it makes students passive recipients of information and increases the risk of plagiarism in their assignments. Additionally, it poses threats for personal data privacy, while the very role of the teacher is under threat. On the other hand, particularly younger teachers, recognize the need for flexibility and adoption to technological developments. They also believe that saving of time is the main advantage of AI and they consider teacher training significantly essential. Concerns about hindering students' critical thinking and exposing then to biased data were expressed by educators participating in the study by Daskalaki et al. (2024). Xing et al. (2025) found that the main concerns related to AI are inaccuracy, lack of specialization, algorithm bias due to biased training data and risks concerning personal data protection. The work of Alier, García-Peñalvo and Camba (2024) identifies problems with authenticity and plagiarism, as students may use AI to create texts for assignments or answer tests, bias, as the training data of AI models may reinforce prejudices, and finally the protection of personal data. The use of AI could create or widen various types of divides (Dieterle, Dede and Walker, 2024): in terms of access to technology, algorithmic bias resulting from training data, the logic of algorithms reinforcing existing social and economic inequalities, the correct interpretation of AI-generated content by teachers and students and finally a social divide, as the accumulation of all these factors can affect students' educational and social development.

Conditions and prerequisites for utilizing AI in the educational process

Foreign language students, who participated in a study conducted by Varsamidou (2024) stated that systematic training in AI use is very important. Another study (Velli and Zafiropoulos, 2024) with the participation of 342 Greek primary and secondary school teachers showed that teacher training in AI is essential to enhance their acceptance and that policies for AI integration in education should focus on the reliability and usability of tools and, finally, that support from colleagues and the school environment can further reinforce their positive attitude toward AI. Gavriilidou (2024) introduces the term "AI literacy" and argues that it will soon become a necessary condition for a citizen's participation in social and economic activities. She emphasizes the importance of education in AI, starting with teacher professional development and the creation of appropriate curricula. The need to train future educators in AI has been noted in a number of studies (Katsantonis and Katsantonis, 2024). Uygun's research (2024), in addition to highlighting the need for education and support, identifies teacher involvement in the development and implementation of AI tools a key factor for successful integration in education. AI literacy, that is the development of skills that allow teachers to understand and critically use AI, is crucial for its integration into teaching (Velander et al., 2023). That is the result of the fact that most teachers learn about AI through incidental learning, which often leads to misconceptions. Moreover, there is lack of clear guidelines in educational programs and policies, Finally, pre-existing beliefs about AI significantly influence teachers' attitudes towards its integration in education.

Dialogic or Large Language Models (LLMs), such as Chat GPT, Gemini, DeepSeek etc., which are rapidly expanding globally, come along with challenges regarding privacy, data integrity, bias and ethical use (Kiortsi, 2024). This highlights the urgent need for strict legal frameworks and increased transparency. Nguyen et al. (2023) noted that, although AI can improve the quality of teaching and learning, it also raises ethical concerns, such as privacy, algorithmic bias and equitable access. Despite efforts by many international organizations such as UNESCO and the European Commission to establish general ethical principles for AI, there is still no broad consensus on a clear ethical framework for AI in education. Huang (2023) identifies several essential factors for the use of AI in education: the regulation of data usage, through legal and institutional frameworks, student education in data safety, protection of student privacy rights and self-regulation of AI industry to promote safe and ethical use.

Teachers' perceptions of AI in Education

The study by Velli and Zafiropoulos (2024) involving 342 Greek primary and secondary education teachers found that perceived usefulness is the most significant factor influencing teachers' intention to use AI tools. Additionally,

the desire for personal innovation and social influence also plays an important role. Teachers with student-centered beliefs tend to perceive AI as more useful and reliable compared to teachers with more "traditional" views. Galindo-Dominguez et al. (2024) studied teachers' attitudes toward AI and correlated them with their overall digital competence. They examined the teachers' perception on AI, their experience with it, their willingness to use AI in education and their expectations about the role of AI in their professional development. The study showed a clear link between digital competence and teachers' attitude towards AI. Uygun's study (2024) involving 74 Turkish teachers showed positive attitudes towards the use of AI in education, highlighting its potential to support personalized learning, improve teacher productivity and save time for teacher-student interaction.

Many studies investigate the attitude of future teachers (students of pedagogical university schools) towards the use of AI in education. Pre-service teachers answer questions about the way they use AI for their studies and, more generally, for their opinion about AI in education. Lavidas et al. (2024) studied the views of 197 students from humanities and social sciences of the University of Patras. The study showed that expected performance (usefulness), habit and enjoyment are the main factors influencing the students' intention to use AI tools. Moreover, intention to use, habit and facilitating conditions (e.g. technical support) were found to influence the actual use of such applications. A similar study by Katsantonis and Katsantonis (2024), involving 190 students from a Greek University's social sciences department, showed that most of them had a positive attitude towards AI. They believed that AI education is important, both for daily activities and for their career, in the future. Furthermore, the sense of digital security was found to enhance the acceptance of AI. The study emphasized the need to integrate AI into educational programs and to prepare students for using AI in their future professional roles. Karataş and Yüce (2024) investigates the use of ChatGPT in education among students in early childhood, elementary education and physical education schools at a Turkish university. The study was conducted after students had received relevant AI training. The results showed that AI facilitates personalized training, reduces teacher workload, enhances the learning experience and supports the creation of teaching material.

RESEARCH METHOD

The aim of this study was to record and analyze the views of future teachers regarding the use of Artificial Intelligence in the educational process. The research was conducted among students of the Annual Program of Pedagogical Training (E.P.PAI.K) of the Higher School of Pedagogical and Technological Education (A.S.PAI.T.E.) in Ioannina. These students come from various fields and have various levels of teaching experience. They are future educators in primary and secondary education. The research questions were:

1. How familiar are pre-service teachers with digital technology and with AI?
2. To what extent do they believe AI can assist teachers?
3. To what extent do they believe AI can support students?
4. How significant do they consider the problems and risks associated with the use of AI in education?
5. How important do they consider the establishment of a regulatory framework and the training of teachers?

The data collection instrument was a questionnaire created for the purposes of the current study. It was based on the results of literature review, the researcher's experience and questionaries from similar studies (Daskalaki et al., 2024; Uygun, 2024; Varsamidou, 2024). The questionary consists of closed-ended Likert scale questions, using a five-point scale (Not at all – 1, A little - 2, Fairly – 3, Much – 4, Very much – 5), capturing the respondent's level of agreement. A few open-ended questions were also included, but they were answered by only a small number of participants. The questionary was distributed to the students in electronic form (via an online form) in March 2025. The link of the form was available after a brief oral introduction by the researcher, during which the purpose of the study was explained, along with assurances of voluntary and anonymous participation. The researcher was not present while the students completed the questionnaire and no clarifying comments were provided during the process.

RESULTS

The presentation of the results includes the demographic and professional characteristics of the students who responded to the questionnaire and the descriptive statistics of their answers in each of the research questions. 81 students responded to the questionnaire (out of the approximately 100 students who attend in the program in Ioannina.) Table 1 presents the characteristics of the respondents.

The following tables present the results of the research. Each table presents the respondents' answers in each research question. The numbers are percentages, rounded to the nearest integer, for ease of reading. Comparisons are also made between answers of each question, by converting the Likert scale answers to numerical values, as follows: 1 – Not at all, 2 - A little, 3 – Fairly, 4 – Much, 5 – Very much. For example, if the average score of a particular question is 3.9,

this indicates that responses are concentrated around 'Much'. In the following, the abbreviation M denotes the mean value and SD denotes the standard deviation. Table 2 presents the responses regarding familiarity with digital technologies, and specifically Artificial Intelligence

Table 1.
Demographic and professional characteristics of the participants

Variable	Value	Count	Percentage
Gender	Man	20	24,7 %
	Woman	61	75,3 %
Age	Up to 25 years old	9	11,1 %
	26 to 35 years old	34	42,0 %
	Over 35 years old	38	46,9 %
Years of teaching experience	0	45	55,6 %
	1 to 5	21	25,9 %
	Over 5	15	18,5 %
Additional studies (the highest)	PHD	1	1,2 %
	Master's degree	46	56,8 %
	Second degree	2	2,5 %
	None	32	39,5 %
Field of basic degree	Humanities/Law/Social studies	10	12,3 %
	Science/Technology/Agricultural	26	32,1 %
	Health/Biology	20	24,7 %
	Economy	16	19,8 %
	Informatics	9	11,1 %

Table 2
Familiarity with digital technology and Artificial Intelligence

Digital technology and AI	Not at all	A little	Fairly	Much	Very much
a) How familiar are you with digital technology (internet, web 2.0, mobile devices etc.)?	0%	6%	20%	42%	32%
b) How secure do you consider digital transactions (payments, e-shops, etc.)?	1%	9%	48%	37%	5%
c) How regularly do you use social media?	2%	2%	14%	30%	52%
d) Are you familiar with digital applications suitable for education?	0%	9%	44%	30%	17%
e) Do you know what Artificial Intelligence (AI) is?	0%	4%	28%	35%	33%
f) How regularly do you use AI applications?	4%	20%	44%	26%	6%

The future teachers who participated in the study reported a high level of familiarity with digital technology (M=4.00, SD=0.88) but moderate familiarity with digital applications suitable for education (M=3.56, SD=0.88). They use social medial very frequently (M=4.26, SD=0.96). The majority stated good knowledge about AI (M=3.98, SD=0.88), although frequency of AI use is moderate (M=3.11, SD=0.92).

The second research question examined the participants' opinions on the extent to which AI can support teachers in any aspect of the educational task. Table 3 presents the responses.

Table 3
AI support for teacher's work

To what extent do you believe AI can support teachers in:	Not at all	A little	Fairly	Much	Very much
a) designing and preparing lessons	0%	5%	16%	57%	22%
b) creating assignments, test, etc.	0%	1%	19%	54%	26%
c) student engagement	0%	7%	28%	40%	25%
d) student assessment	6%	7%	33%	37%	16%
e) grading and correction students' work	4%	14%	37%	32%	14%
f) personalized teaching to meet individual student needs	9%	6%	35%	38%	12%
g) administrative/management tasks	4%	11%	32%	40%	14%

The participants consider that the area that AI can contribute the most is creation of assignments and tests (M=4,05, TA=0,71). Lesson planning and preparation (M=3,96, TA=0,77) and student engagement are two functions in which AI can provide significant support. The future teachers consider the remaining functions of Table 3, less suitable for AI support.

The third research question explored the future teachers' perceptions about the potential and suitability of AI to support students' work. Table 4 present specific areas AI could assist with, along with respondents' responses.

Table 4
AI support for students

To what extent do you believe AI can support students in:	Not at all	A little	Fairly	Much	Very much
a) production of written language	14%	16%	31%	36%	4%
b) brainstorming ideas for a topic	1%	12%	26%	52%	9%
c) knowledge acquisition	2%	9%	26%	46%	17%
d) becoming familiar with technology	0%	0%	15%	49%	36%

The participants of the research believe that AI can support students, but to a lesser extent compared to the support it can offer teachers. They stated that AI can significantly contribute to students' familiarity with technology (M=4,21, TA=0,68), whereas the other three functions can moderately by supported by AI.

Table 5 presents the participants' responses in six questions related to the fourth research question about problems and risks of use of AI in education.

Table 5
Risks and issues from the use of AI in education

To what extent do you believe the following are risks and issues of AI in education:	Not at all	A little	Fairly	Much	Very much
a) hindering student's critical thinking	0%	5%	20%	36%	40%
b) threat to personal data privacy	1%	9%	48%	26%	16%
c) exposing students to misleading or harmful content	2%	7%	51%	28%	11%
d) increased risk of plagiarism and copyright infringement	1%	9%	32%	36%	22%
e) undermining teacher's role	1%	11%	32%	31%	25%
f) increased risk of student dependency and isolation	1%	5%	20%	36%	38%

The study showed that the participants are aware of the potential challenges and risks associated with integration of AI in educational settings. They express concern that AI could impede the development of students' critical thinking skills (M=4.10, SD=0,89) and could also contribute to increased dependency and social isolation from authentic human interactions (M=4.05, SD=0.95). The other risks are regarded as somewhat less significant. It should be mentioned that a

considerable number of future teachers perceive AI as a factor that could diminish the traditional role of the teacher (M=3.37, SD=1.01).

Finally, the participants were asked how necessary they consider the establishment of rules and policies for the use of AI in education, as well as the need for systematic teacher training. International and Greek literature identifies these two factors as essential for the safe and effective integration of AI. Table 6 shows the related findings.

Table 6
Prerequisites for the safe and effective integration of AI

	Not at all	A little	Fairly	Much	Very much
How essential do you consider the establishment of rules and policies for the appropriate use of AI in education?	1%	1%	5%	46%	47%
How important do you consider systematic teacher training on AI use in educational settings?	1%	2%	10%	43%	43%

It is clear that future teachers consider both the establishment of rules and policies (M=4.36, SD=0.75) and systematic teacher training (M=4.25, SD=0.83) as crucial for integration of AI in education.

CONCLUSIONS

The results of the study revealed that the students of the Annual Pedagogical Training Program (E.P.PAI.K.) of A.S.PAI.T.E.) in Ioannina, who are prospective teachers from various academic disciplines, are familiar with digital technology and its applications in education. They reported knowledge of AI, although its use in practice remains moderate. It should be noted that he pedagogical integration of digital technology, including AI, is part pf the curriculum in the E.P.PAI.K. program. The participants recognize the value of AI in educational contexts, particularly in functions that contribute to time efficiency for teachers, such as the development of assignments and exams as well as lesson planning and preparation. Similar findings have been documented in the literature (Varsamidou, 2024; Velli and Zafiropoulos, 2024). With regard to use of AI by students, respondents perceived it as less beneficial for learners compared to its advantages for educators, giving greater emphasis on students becoming generally acquainted with technology. The importance of citizens being able to use AI effectively in both professional and everyday contexts (referred to as AI literacy) has been emphasized by numerous researchers (Gavriilidou, 2024; Velander, 2024).

The use of AI in education also raises concerns among future educators. A significant number of participants expressed the opinion that AI could hinder students' critical thinking and creativity and potentially lead to dependence and isolation from real social interaction. These concerns are consistent with findings in various recent studies (Daskalaki, Psaroudaki and Fragopoulou, 2024). Finally, the respondents highlighted the need for essential conditions to ensure the effective and safe use of AI in education. These include the formulation and enforcement of appropriate policies and ethical guidelines, systematic professional development for in-service teachers and the integration of relevant training in the education of pre-service teachers. Such needs are widely emphasized in current literature (Katsantonis and Katsantonis, 2024).

ABSTRACT

This study examines the scholarly output on digital career guidance and counselling through a quantitative bibliometric approach. A corpus of 167 publications from 1998 to early 2025 was analyzed using descriptive statistics, keyword co-occurrence, trend-topic methods, and thematic mapping to elucidate publication dynamics, author collaborations, and conceptual structures. Results show a stable annual publication rate, an average of 10.8 citations per document, and a mean of 3.7 authors per publication, with only 14.4% of papers involving international co-authorship. Journal articles emerged as the predominant dissemination venue, supplemented by conference proceedings and book chapters. Trend-topic analysis reveals an intellectual progression from institutional and infrastructure concerns (2001–2005), through e-learning and computer-assisted instruction (2005–2012), to sector-specific applications in medical education (2010–2014), culminating in recent interest in affective, motivational, and artificial-intelligence paradigms (2022–2023). Thematic mapping identifies *humans*, *mentoring*, and the *internet* as well-developed (motor) themes, while AI-related terms and chatbots emerge as new topics. These findings delineate a mature research domain with shifting thematic emphases. Future studies may advance global collaboration, examine the ethical dimensions of AI-mediated counseling tools, and address digital inequities within career guidance systems.

Keywords: Counseling, Digital Media, Systematic Review, Scientometrics

INTRODUCTION

The rapid integration of digital technologies in education and the labor market has brought about profound changes in the way counselling services are delivered. Particularly since the COVID-19 pandemic, the transition from exclusively face-to-face to digital or hybrid coaching environments has accelerated dramatically, highlighting the need for a systematic rethinking of the methods, tools, and ethical principles that underpin the coaching profession (Staunton, 2025; Sampson & Osborn, 2015).

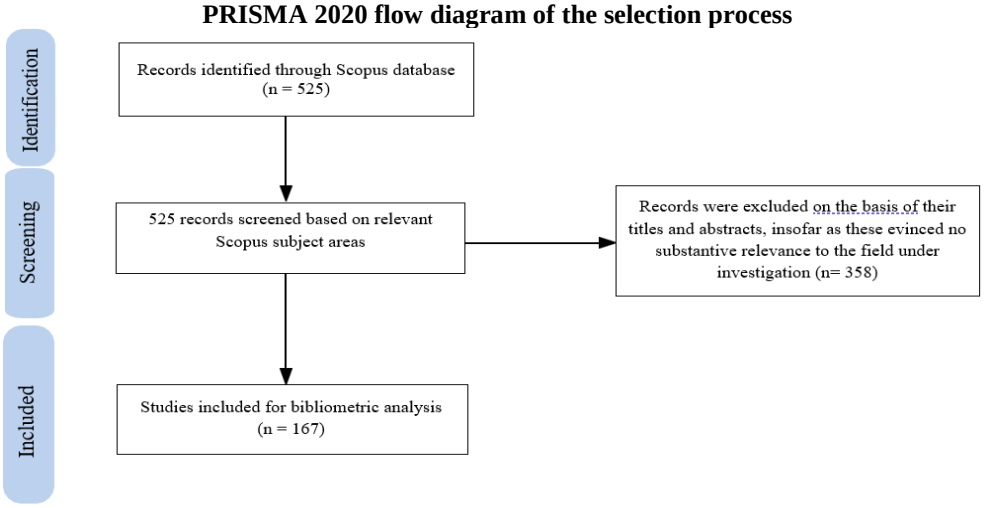
The development of effective digital career guidance systems draws upon a combination of established theoretical models that offer complementary perspectives. Holland's RIASEC framework establishes a psychometric basis for aligning individual personality characteristics with vocational environments, thereby informing the construction of interest-based assessment instruments within online platforms (Leung, 2022). Concurrently, Savickas' Career Construction Theory offers a narrative paradigm that foregrounds adaptability, identity formation, and meaning making in career development, principles translated into interactive, reflective functionalities in digital interventions (Di Fabio & Maree, 2013; McIlveen & Patton, 2007). From a technological standpoint, the Technology Acceptance Model explicates determinants of user engagement in terms of perceived usefulness and ease of use, guiding the design of accessible, user-centered systems (Legris et al., 2002). Although these models originate in discrete disciplinary domains, psychometric assessment, narrative counseling, and technology adoption, they coalesce within digital contexts to underpin the development of career guidance tools that exhibit structural validity, pedagogical relevance, and responsiveness to individual psychological needs (Leung, 2022; Osborn & Sampson, 2015).

Computer-based Career Assessment and Guidance Systems (CACGS) play a dominant role in digital support. As Leung (2022) points out, modern CACGS, such as Infinity in Hong Kong, combine automated assessment processes, information support for career choices, and career planning tools, significantly reducing uncertainty in decision-making, especially among students. At the same time, the use of online personality and interest assessment tools offers immediate feedback and presents personalized career paths (Zainudin et al., 2020).

In the Greek context, platforms such as the e-stadiodromia of EOPPEP provide integrated guidance services, including information on educational programs, self-assessment tools, and the possibility of harmonization with European standards, e.g., Europass. Teleconsultation, either through video conferencing or written interaction, is becoming increasingly widespread, especially in times of limited physical access (Urdzina-Merca & Dislere, 2018). Recent scholarship has interrogated the attendant ethical dimensions within educational settings, notably issues of equity, accountability, and the risk of dehumanization (Morley et al., 2019). Additionally, the use of social networks, such as LinkedIn, for professional networking and mentoring introduces new opportunities while simultaneously requiring careful adherence to ethical standards and privacy considerations (Healy et al., 2023; Sampson & Osborn, 2015).

Among the key advantages of digital media are enhanced accessibility, greater flexibility in terms of service delivery time and location, tailored guidance based on individual profiles, and the ability to track progress systematically via e-portfolios. The integration of machine learning algorithms and chatbots is anticipated to enhance personalized guidance and support further (Wang & Li, 2024). However, Bankins et al. (2024) argue that the deployment of such systems must be underpinned by ethical transparency and firmly aligned with human-centered counselling values to engender trust and promote equity, an imperative echoed across contemporary AI ethics frameworks, which foreground fairness, accountability, and societal benefit (Floridi & Cowls, 2019; Jobin et al., 2019; Whittlestone et al., 2019). Nonetheless, the digital switchover also comes with significant challenges. First, the digital divide continues to exclude groups with limited access to technology or low digital skills (Lythreatis et al., 2021). Second, the abundance of information available often creates confusion, as users struggle to assess its validity (Eppler & Mengis, 2004). Finally, establishing and maintaining a trusting relationship between advisor and advisee has proven more difficult in the digital space, and the absence of a physical presence may reduce the depth and immediacy of communication (Staunton, 2025).

Ultimately, the incorporation of digital media into counseling practice heralds novel avenues for delivering innovative, individualized, and adaptable services. By leveraging robust digital infrastructures, the integration of educational and vocational guidance can facilitate individuals' seamless progression into lifelong learning and career trajectories. Nevertheless, the efficacy of these interventions hinges on rigorous, ongoing evaluation of technological tools, enhanced professional training, and sustained institutional support to ensure that digital systems augment, rather than displace, the human element, in accordance with human-centered AI principles advocating for safe, responsible, and user-aligned design (Shneiderman, 2020). Consequently, although digital guidance platforms hold considerable promise, their design and implementation should remain firmly rooted in transparent, evidence-based practices that acknowledge both their transformative potential and attendant systemic risks (Yazdani et al., 2023).



METHODOLOGY

This study adopts a quantitative, systematic bibliometric approach to analyze the structure and evolution of research within the discourse of counseling guidance and digital media (Bitzenis et al., 2025A; Bitzenis et al., 2023). The dataset was retrieved from the Scopus database (Nosios et al., 2025), using the following search query:

TITLE-ABS-KEY ((education OR training) AND mentoring AND (cti OR internet OR ai)) AND (LIMIT-TO (DOCTYPE , "ar") OR LIMIT-TO (DOCTYPE , "cp") OR LIMIT-TO (DOCTYPE , "ch") OR LIMIT-TO (DOCTYPE , "re")) AND (LIMIT-TO (SUBJAREA , "SOCI") OR LIMIT-TO (SUBJAREA , "COMP") OR LIMIT-TO (SUBJAREA , "ENGI") OR LIMIT-TO (SUBJAREA , "BUSI") OR LIMIT-TO (SUBJAREA , "PSYC") OR LIMIT-TO (SUBJAREA , "ARTS") OR LIMIT-TO (SUBJAREA , "MATH") OR LIMIT-TO (SUBJAREA , "ENVI") OR LIMIT-TO (SUBJAREA , "AGRI") OR LIMIT-TO (SUBJAREA , "PHYS") OR LIMIT-TO (SUBJAREA , "ECON") OR LIMIT-TO (SUBJAREA , "DECI") OR LIMIT-TO (SUBJAREA , "ENER") OR LIMIT-TO (SUBJAREA , "MATE") OR LIMIT-TO (SUBJAREA , "MULT") OR LIMIT-TO (SUBJAREA , "CENG") OR LIMIT-TO (SUBJAREA , "CHEM"))

Furthermore, the processes of identification, screening, and selection of studies were conducted in accordance with the PRISMA 2020 (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines, thereby ensuring methodological rigor, transparency, and replicability, as depicted in Figure 1 (Page et al., 2021). Inclusion was restricted to English-language, peer-reviewed publications indexed in Scopus, thus ensuring methodological consistency, topical relevance, and a baseline level of scholarly quality, while non-English sources were excluded during the screening process.

Figure 1
PRISMA 2020 flow diagram of the selection process

Lastly, the finalized dataset was imported into the R statistical environment for comprehensive analysis (Bitzenis & Koutsoupias, 2023A; Bitzenis & Koutsoupias, 2023B). Utilizing the bibliometrix package, a suite of bibliometric tools and visualizations was employed to examine the data (Bitzenis & Koutsoupias, 2024A; Bitzenis & Koutsoupias, 2024B). Through this approach, key outputs, including descriptive tables, thematic maps, most frequent word graphs, and trend topic analyses, were systematically generated (Bitzenis et al., 2025B; Bitzenis et al., 2025C), enabling a robust exploration of publication trends, conceptual structures, and emerging research themes within the selected body of literature (Thomos et al., 2023; Zourna et al., 2021).

RESULTS

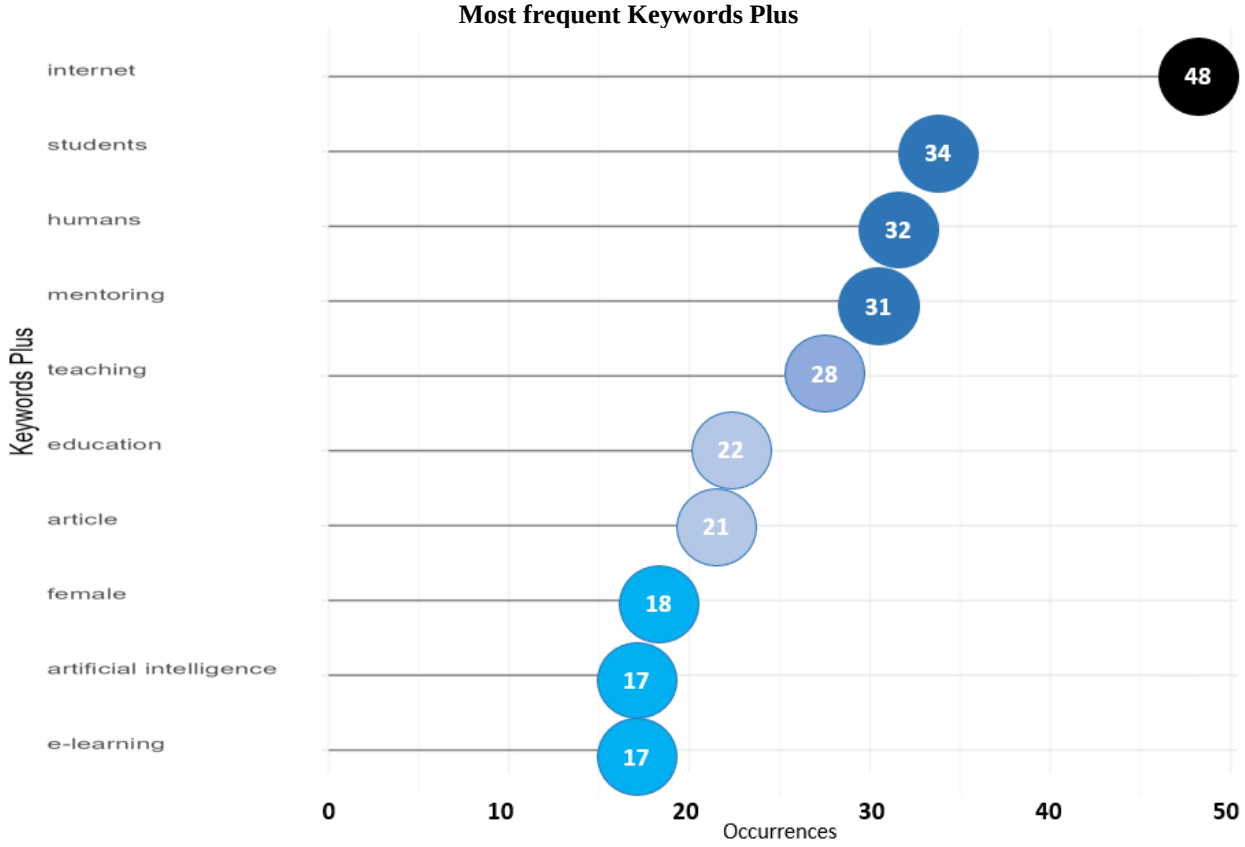
This section presents the main results of the bibliometric analysis, focusing on the scholarly output, collaboration patterns, and thematic orientations within digital career guidance and counselling.

The dataset under analysis, as depicted in Table 1, encompasses 167 documents published between 1998 and early 2025, drawn from 137 distinct outlets. Over the past 27 years, the annual growth rate in publication count has remained essentially stable rather than expanding or contracting. This plateau in volume suggests that, although the topic has attracted sustained interest, it has neither surged into a high-growth phase nor waned substantially over time.

Table 1
Descriptive statistics

Description	Results
MAIN INFORMATION ABOUT DATA	
Timespan	1998:2025
Sources (Journals, Books, etc.)	137
Documents	167
Annual Growth Rate %	0
Document Average Age	9.66
Average citations per doc	10.84
References REFERENCES	5010
DOCUMENT CONTENTS	
Keywords Plus (ID)	978
Author's Keywords (DE)	506
AUTHORS	
Authors	610
Authors of single-authored docs	23
AUTHORS COLLABORATION	
Single-authored docs	23
Co-Authors per Doc	3.71
International co-authorships %	14.37
DOCUMENT TYPES	
article	94
book chapter	16
conference paper	48
review	9

In terms of scholarly impact, the corpus achieves an average of 10.84 citations per document. With a total of 5,010 references cited across all papers, an average of roughly 30 references per document, authors routinely anchor their work in existing literature. The modest citation rate points to a research area characterized by steady engagement rather than a few outlier *blockbuster* studies; contributions typically receive a moderate level of attention without dominating citation indices.



Authorship patterns reveal an intensely collaborative culture. Across 167 documents, 610 unique authors appear, yielding an average of approximately 3.7 co-authors per paper. Only 23 documents (13.8 percent) are single-authored, underscoring a clear preference for teamwork. International collaboration, however, accounts for just 14.4 percent of co-authored outputs, implying that most partnerships occur within the same country or region. While co-authorship is the norm, cross-border cooperation remains relatively limited.

Publication types further illustrate the field's communication channels: journal articles dominate with 94 entries, followed by conference papers at 48, book chapters at 16, and reviews at 9. This distribution highlights peer-reviewed articles as the principal medium for disseminating original findings, complemented by conferences as secondary venues and book chapters as occasional outlets for more in-depth or interdisciplinary perspectives. Reviews, though fewer in number, likely serve as periodic syntheses that consolidate prevailing knowledge.

Ultimately, these descriptive metrics portray a mature and stable research domain. The consistent document count, moderate citation impact, and predominance of multi-authored journal articles indicate an established community

that regularly engages with its literature and favors collaborative production. At the same time, the relatively low rate of international collaboration suggests potential for broader geographic integration, even as the balance of publication types confirms the enduring centrality of journal articles supplemented by conferences and edited volumes (see Table 1).

Figure 2
Most frequent Keywords Plus

An integrative overview of the principal thematic orientations identified within the reviewed corpus is presented in Figure 2. The term *internet,* with 48 occurrences, underscores the foundational role of web-based infrastructures in delivering contemporary guidance services. Its prominence signals a paradigmatic shift from traditional, face-to-face counselling toward virtual modalities, especially in educational contexts that demand both accessibility and scalability. Similarly, the frequent citation of *students* (34 mentions) identifies this cohort as the principal beneficiary of digital guidance interventions. The prevalence of teaching (28 occurrences) and *education* (22 occurrences) further corroborates the embedding of digital counselling tools within broader pedagogical frameworks, often through their integration with instructional technologies or curricular initiatives.

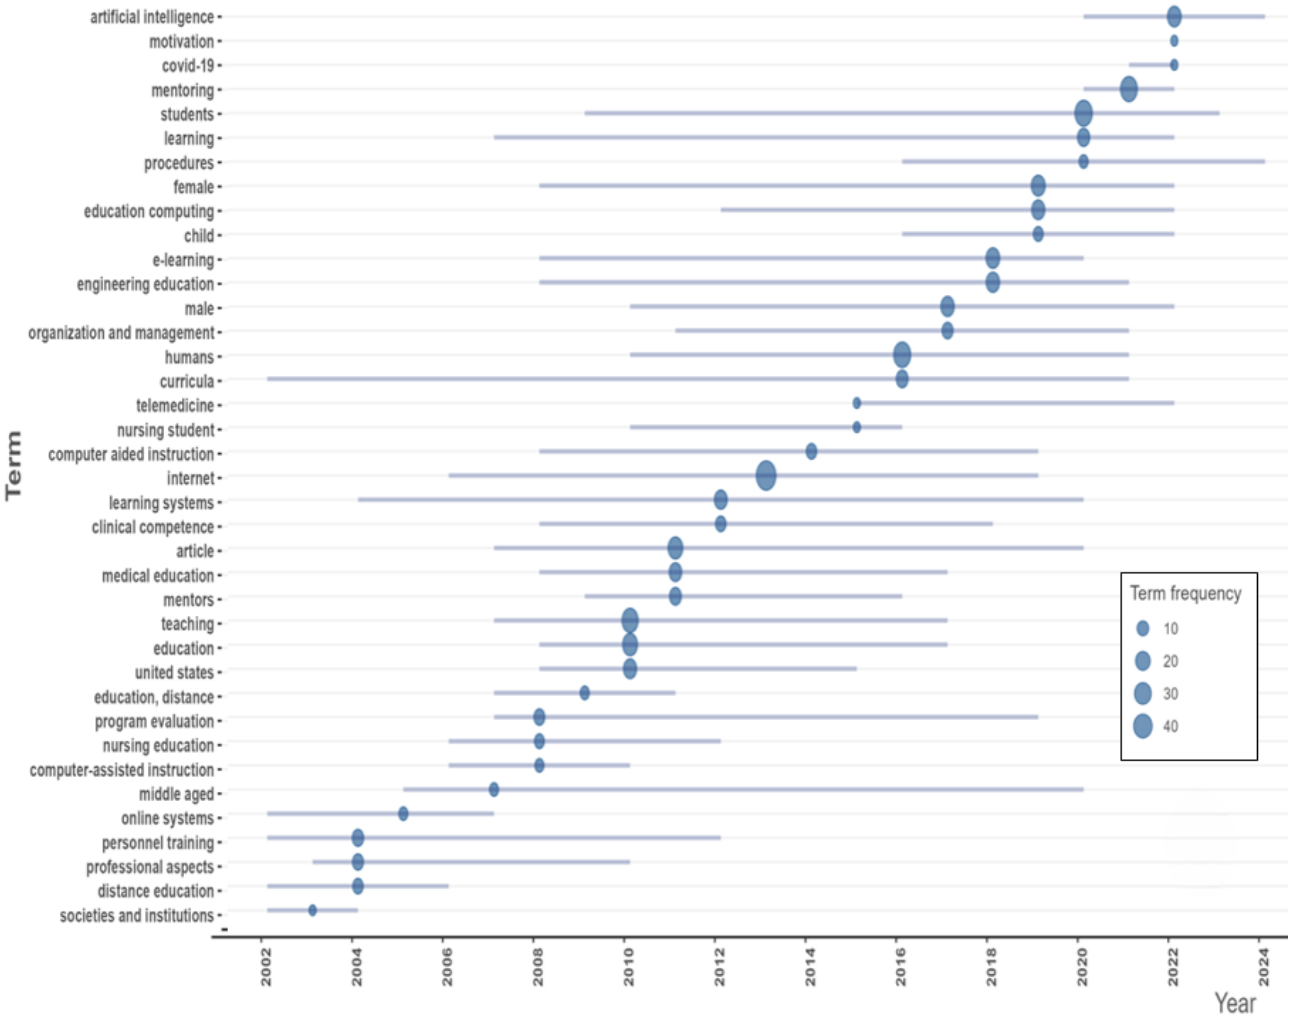
Conversely, the term *humans,* appearing 32 times, introduces an essential discourse on human agency in technology-mediated settings. Its recurrence reflects sustained scholarly interest in the cognitive and ethical dimensions of algorithmically filtered counselling, encompassing issues such as trust, autonomy, and the evolving character of interpersonal support. The adjacent prominence of *mentoring* (31 mentions) reinforces this human-centered perspective, indicating that researchers regard digital platforms not merely as repositories of information but as mechanisms for fostering relational guidance structures.

Although *artificial intelligence* surfaces less frequently (17 mentions), it remains integral to the field's intellectual trajectory. This lower index position likely reflects variations in keyword tagging rather than genuine marginality; AI-related discussions often appear under the guise of personalization, automation, or decision support without explicit labeling. Nonetheless, its presence affirms growing engagement with intelligent systems capable of processing user data, modeling learning pathways, and enhancing decision-making processes.

Finally, terms such as *e-learning* (17 mentions) and *female* (18 mentions) point to more specialized subdomains within the digital guidance landscape. The former situates the discourse firmly within virtual educational ecosystems, while the latter suggests a focus on demographic or gender-based analyses of user engagement and outcomes. Collectively,

this distribution of keywords delineates a research domain at the nexus of education, digital infrastructure, and personalized human support, an arena increasingly shaped by the incorporation of AI technologies (see Figure 2).

Figure 3
Trend topics graph



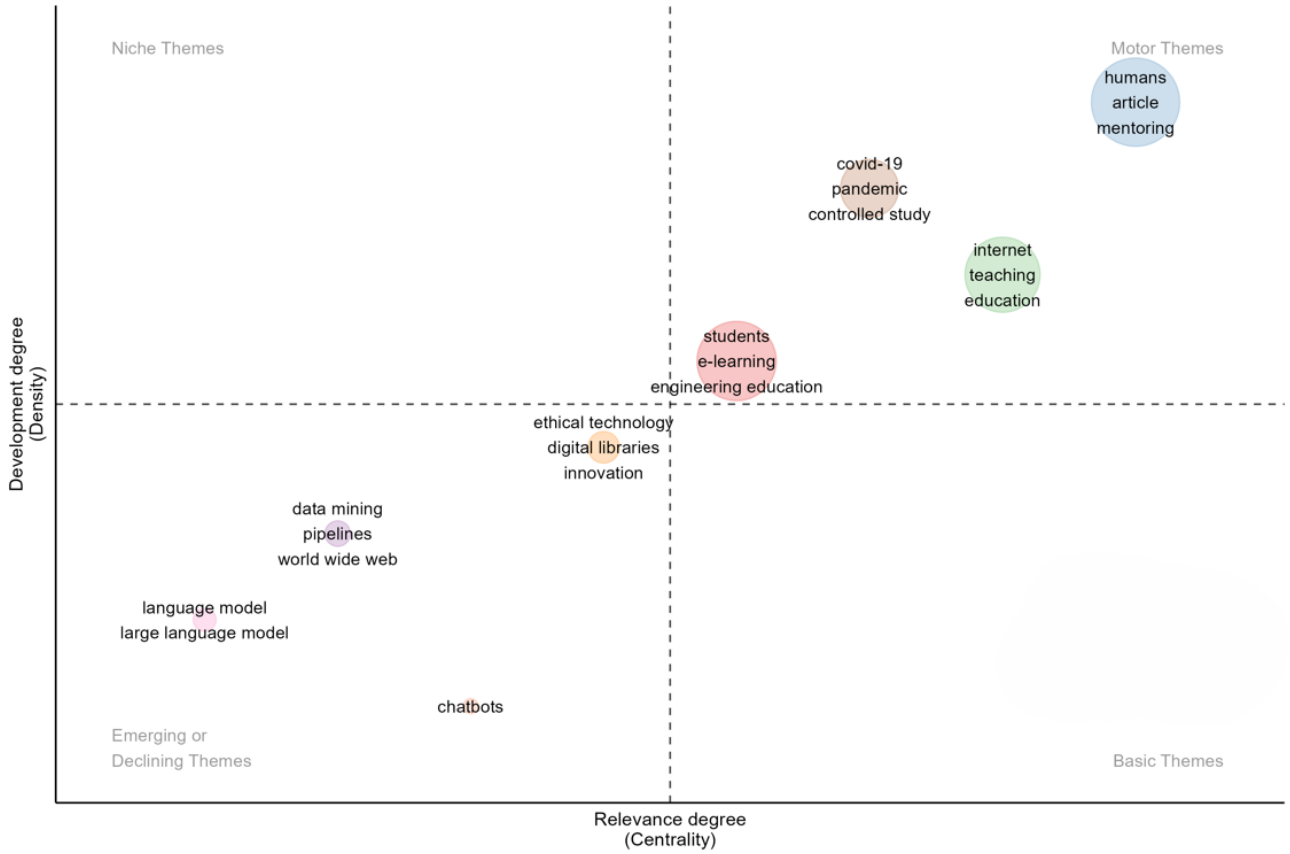


Figure 3 presents a bubble timeline visualization charting the temporal trajectories and relative prominence of thirty pivotal bibliometric terms from 2001 to 2023. Each horizontal bar delineates the lifespan of a term, while the area of its superimposed circle denotes that term's maximum annual frequency. In the initial phase (2001–2005), scholarly emphasis rested on educational infrastructure and organization. Transient descriptors, *societies and institutions, distance education,* and *personnel training* concluded by 2004, registering modest peaks of five to ten mentions, reflecting a nascent concern with institutional logistics and foundational delivery mechanisms.

The ensuing period, between 2005 and 2012, witnessed a decisive turn toward technology-enhanced pedagogy. Terms such as *computer-assisted instruction, online systems,* and *internet* persist across multiple years, peaking at approximately twenty to thirty citations between 2007 and 2009. Concurrently, *learning systems* and *e-learning* extend their presence beyond 2010, signaling an enduring investment in digital platforms and instructional software. The simultaneous rise of *program evaluation* and *education computing* further conveys an evaluative orientation, as scholars assessed the efficacy and infrastructure of these emergent modalities. Furthermore, between 2010 and 2014, a cohesive cluster of healthcare-oriented pedagogical themes emerged, including *medical education, clinical competence,* and *nursing student*, each maintaining visibility into the mid-2010s and achieving peaks of fifteen to twenty-five mentions between 2011 and 2013. The advent of *telemedicine* within this interval underscores the integration of remote healthcare delivery with educational research, marking a concentrated phase of inquiry into clinical training methodologies.

From around 2015 onwards, the research agenda expanded to encompass the affective dimensions of learning alongside sophisticated technological constructs. Terms such as *students, teaching, mentors,* and *motivation* recur prominently during 2015–2017 and again in 2020–2021, attesting to sustained interest in relational dynamics and learner engagement. The appearance of *covid-19* in 2021, albeit with a narrower temporal window, highlights a responsive shift to global exigencies. Most notably, the term *artificial intelligence* experienced a notable surge from 2016 to 2023, culminating in an unprecedented peak, with nearly forty mentions, in 2022–2023, which evidences the field's intensified focus on AI-driven educational paradigms.

Collectively, these diachronic patterns trace a coherent evolution: from early institutional and structural concerns through successive waves of digital adoption and sector-specific applications, to the current confluence of affective strategies and AI-infused innovations in digital counselling and educational research (see Figure 3).

Figure 4
Thematic map

The thematic map in Figure 4 arranges thirty bibliometric terms along two axes: *centrality* (relevance) on the x-axis and *density* (development) on the y-axis, with bubble size indicating term frequency. This configuration yields four distinct quadrants: *motor themes* (high centrality and high density), *basic themes* (high centrality and low density), *niche themes* (low centrality and high density), and *emerging* or *declining themes* (low centrality and low density). These groupings provide a structured overview of how concepts within the field vary in both their connectivity to the broader literature and the cohesiveness of their internal scholarship (Koutsoupias & Nosios, 2025).

In the top-right Motor Themes quadrant, four clusters emerge. Notably, the *humans, article,* and *mentoring* cluster boasts the highest amalgamation of centrality and density, signaling a vibrant, self-sustaining research stream that remains deeply interwoven with the broader scholarly landscape. Slightly below and to its left, the *internet, teaching,* and *education* cluster also resides firmly within the Motor domain but aligns closer to the mean density threshold, reflecting its widespread impact alongside comparatively dispersed internal cohesion. The *covid-19, pandemic,* and *controlled study* cluster, positioned just above the median on both axes, exemplifies a methodically organized body of pandemic-focused educational inquiry that maintains consistent engagement with the field's central nexus. The *students, e-learning,* and *engineering education* cluster, located just to the right of the centrality midpoint and marginally above the density

midpoint, likewise occupies the Motor quadrant; its proximity to the intersection denotes an emergent yet coherent theme that seamlessly bridges digital-learning research with engineering-specific pedagogical practice.

Lastly, the lower-left quadrant, designated for Emerging or Declining Themes, comprises three clusters distinguished by both low density and low centrality. Nearest the quadrant's midpoint, the *ethical technology, digital libraries,* and *innovation* cluster exhibits the most cohesive internal network, yet it remains largely insulated from adjacent thematic areas. Receding further toward the origin are the *data mining, pipelines,* and *world wide web* cluster, and the *language model, large language model,* and *chatbots* clusters, each occupying the disciplinary periphery. Their sparse interconnections and marginal positioning suggest that these topics either represent incipient lines of scholarly inquiry or have yet to coalesce into stable, conceptually unified research programs.

Overall, the thematic landscape is anchored by dynamic mentoring and pandemic research streams, undergirded by a foundational yet still-congealing body of Internet-based teaching literature, and enriched by both specialized and emerging clusters. This configuration delineates the discipline's current intellectual core while simultaneously pointing to clear opportunities for theoretical synthesis and methodological innovation at its periphery (see Figure 4).

CONCLUSIONS

The findings of the present bibliometric study, encompassing 167 publications from 1998 to 2025, highlight a sustained, systematic maturation of the research domain pertaining to career guidance mediated by digital tools. Quantitative analysis reveals consistent scholarly production, as evidenced by an average citation rate of 10.8 citations per publication, underscoring a steady academic influence with minimal deviations. Collaborative authorship prevails, with an average of 3.7 authors per publication, thereby emphasizing collective expertise as the primary mechanism for advancing knowledge. However, the relatively modest level of international collaboration, accounting for only 14.4% of the reviewed works, underscores a considerable margin for expanded global scholarly exchange and interdisciplinary cooperation.

Thematic progression within the field exhibits distinct evolutionary phases. Initially, research from 2001 to 2005 primarily focused on foundational aspects, such as institutional frameworks and digital infrastructure, necessary for delivering distance-based career guidance. Between 2005 and 2012, scholarly interest transitioned toward pedagogical dimensions, emphasizing computer-assisted instructional methodologies and e-learning environments, reflecting an enhanced recognition of digital media's educational potential. Subsequently, from 2010 to 2014, specialization became apparent in health-related guidance contexts, notably medical education and telemedicine, demonstrating sector-specific applicability and the domain's expanding scope. The most recent period (post-2015) has witnessed heightened engagement with the affective and motivational dimensions of career guidance, notably intensified through the integration of advanced technological tools, such as artificial intelligence, chatbots, and large language models. These topics reached peak prominence in scholarly discourse around 2022–2023.

Future research avenues emerging from this study emphasize several strategic directions. Firstly, enhancing international and interdisciplinary collaboration represents a critical pathway toward enriched innovation and greater global impact. Secondly, empirical investigations should explore the emotional, ethical, and relational implications associated with AI and automated guidance tools, particularly in relation to user autonomy, trust, and psychosocial well-being. Thirdly, targeted interventions aimed at diminishing digital disparities and fostering digital literacy should be systematically developed and evaluated. Additionally, longitudinal studies assessing real-life career outcomes linked to digital intervention utilization are crucial for substantiating evidence-based policy decisions and practical guidelines. Lastly, the field would significantly benefit from theoretical enrichment through frameworks such as Responsible AI and Human-Centered Design, ensuring alignment between technological innovation and fundamental humanistic and ethical principles.

In conclusion, this study demonstrates that career guidance mediated by digital technologies has evolved through stable, coherent trajectories characterized by adaptability and consistent human-centered orientations. While quantitative and thematic analyses reflect optimism concerning digital innovations, continuous scholarly vigilance regarding ethical integrity, interpersonal quality, and equitable access remains imperative. The ongoing relevance and effectiveness of digital career guidance depend on continuous empirical evaluation, careful ethical reflection, and a sustained commitment to preserving genuine human engagement within technological environments.

ARTIFICIAL INTELLIGENCE IN EDUCATION POSSIBLE OBSTACLES AND RISKS

Petsiou Charikleia
Education Consultant for Mathematics
Secondary Education Directorate of Ioannina
Ioannina, Greece
e-mail: harapetsiou@yahoo.gr

ABSTRACT

When integrating Artificial Intelligence (AI) into the field of education, various challenges and potential threats are likely to arise. Despite the promising potential of AI, its reckless application carries significant risks. The main areas of concern include dilemmas such as algorithmic bias, lack of transparency, privacy, human communication and the development of critical thinking. In addition, there are practical obstacles related to the logistical infrastructure and teacher training.

The research approach of the paper is qualitative and is based on semi-structured interviews with 23 primary and secondary education teachers from various parts of Greece, of various specialties, who have experience with popular AI chatbots. Concerns related to misinformation, role distortion and student dependence on AI systems were highlighted. The research concludes that there is a need for a prudent and responsible approach to the adoption of AI, accompanied by the formulation of appropriate policies and guidelines, in order to maximize the benefits and minimize the negative impacts.

Keywords: Artificial Intelligence, AI chatbots, Education, risks-barriers, preventive measures, solution management

INTRODUCTION

The rapid development of technology is reshaping aspects of our daily lives, with the education sector being no exception (Russell & Norvig, 2010). AI promises to revolutionize the way students acquire knowledge and teachers teach. It promises more effective educational administration and expanded access to knowledge (Parra et al., 2024). The rapid development of language models has led to the emergence of sophisticated AI chatbots, such as ChatGPT, Gemini, Copilot, DeepSeek and others, which are computer programs designed to simulate conversations with humans via text or voice. They function as a digital assistant, capable of answering questions, performing actions, providing information and automating processes (SAP, 2024). AI chatbots use machine learning and natural language processing technologies to understand and answer users' questions more dynamically, and as they interact with users, they improve their responsiveness. However, along with these opportunities, there are also important questions and ethical challenges that need to be addressed responsibly, as they pose risks that affect both student privacy and the principles of equity and inclusion in access. The integration of AI into the educational context raises a number of concerns that require careful consideration to ensure its responsible and beneficial implementation.

The paper attempts an in-depth investigation of the challenges, difficulties and issues related to the application of AI in the field of education. A thorough understanding of these challenges is not just a desirable process, but is characterized as a fundamental and absolutely necessary prerequisite in order to fully understand both the obvious difficulties and limitations, as well as the possible hidden risks or reactions that may accompany the use of AI in education. The global perception will allow us to design and formulate effective strategies and policies to make full use of the enormous potential and opportunities offered by AI for the upgrading of education. At the same time, solutions will be proposed to minimize the undesirable side effects or negative consequences that may arise.

LITERATURE REVIEW

Artificial Intelligence (AI) is a transformative factor in the field of education, and the scientific literature is rapidly growing to record its multidimensional impacts. Applications of AI in education offer significant advantages, which concern both students and teachers. One of the most notable benefits is the possibility of personalized learning, where educational systems adapt the content and pace of teaching according to the needs of each student. This adaptability enhances the effectiveness of learning, providing immediate feedback and support (Chen et al., 2022). In addition, AI contributes to the automation of assessment, reducing the workload of teachers and allowing them to focus on more creative and pedagogical activities (Karpouzis, 2024). In addition, smart educational systems and learning data analysis tools are provided, which offer teachers information about the progress of their students (Avramidis, 2024). In the Greek context, the literature highlights the value of AI in adaptive learning and in enhancing interactivity in the educational process (Samara, 2021).

Despite the impressive benefits, the integration of AI in education comes with significant risks and ethical dilemmas (Pontikopoulos, 2023). One of the most pressing issues is algorithmic bias, which can reinforce existing social inequalities if the educational data that feeds AI systems is unrepresentative or biased (Bu, 2022). For example, the use of algorithms to assess students or allocate resources can lead to algorithmic bias if the data on which AI systems are trained reflects or reinforces existing social inequalities (Saputra et al., 2023). In addition, disinformation through AI is a growing risk, as systems can generate convincing but false content, which can be used for illegitimate purposes (Chen Kulesa, 2024). These challenges highlight the need for strict ethical rules and regulations that will ensure the fair and transparent use of AI in education.

An additional serious risk concerns the protection of personal data. AI systems collect and process huge volumes of sensitive information, such as data on student performance, behavior, and learning preferences. Inadequate management of this data can lead to privacy violations and information misuse, jeopardizing the fundamental rights of users (Kamalov et al., 2023). In Greece, the need for strict data security protocols has been highlighted as crucial for protecting students and avoiding discriminatory practices (Varmazi, 2022). The lack of appropriate protection measures can undermine trust in the education system and create new risks to academic integrity.

The pedagogical challenges arising from the use of AI are equally significant. One of the main concerns is the potential undermining of critical thinking and problem-solving skills. Overreliance on AI tools, such as AI chatbots, can lead to superficial learning, where students do not develop the capacity for analysis and autonomous thinking (Yuskovych-Zhukovska et al., 2022). Furthermore, the reduction of human interaction between students and teachers can negatively affect the development of social skills, such as collaboration and empathy (Flores-Viva & García-Peñalvo, 2023). These issues require a balanced approach, where AI is used as a complementary tool and not as a substitute for human activity.

Academic integrity is another critical issue that arises with the development of AI. The ability of systems to produce high-quality texts and solutions in real time raises concerns about the increase in cases of plagiarism and fraud. Educators face difficulties in detecting the use of AI by students, which requires the development of new assessment methods and detection tools (Kamalov et al., 2023). This issue highlights the need to inform and raise awareness of both students and educators about the ethical implications of the use of AI.

Many educational institutions face challenges due to a lack of technical resources or specialized staff. In order for the integration of AI in education to be effective, it is necessary to develop appropriate technical infrastructure and unhindered access for all members of the educational community. In this way, core values such as equality, inclusion and justice will be promoted. In addition, teachers may hesitate to adapt to new technologies for fear that AI will replace their roles and this may lead to resistance (Ghulam Ali, 2025), which is why continuous training of teachers in AI and digital skills is crucial for the successful integration of technology in education (Özer, 2024). With the new digital skills that teachers will acquire, they will use AI in a pedagogically effective way (Pedro et al., 2019).

Global and local discussions need to focus on both the benefits and risks to ensure that AI is used in a way that is aligned with educational values and the needs of students (Hesham et al., 2023). Only through a holistic and critical approach can a sustainable and equitable application of AI in education be achieved.

RESEARCH PURPOSE AND OBJECTIVES

The research aims to highlight the main concerns and challenges arising from the application of AI, and specifically AI chatbots, in the educational process. At the same time, it seeks to understand the potential risks and formulate proposals for the effective, safe and ethically responsible use of these tools.

The specific objectives of the paper are:

- To present the views of teachers and possible strategies for addressing the identified issues.
- To promote the dialogue on the responsible and effective integration of AI technology into the modern education system, through the interpretation of teachers' perceptions.

RESEARCH QUESTIONS

The research questions guiding this study are the following:

1. What are the main barriers and risks associated with the widespread use of AI chatbots in education?
2. What preventive actions and management strategies can be implemented to address these risks?

PARTICIPANTS

The qualitative research involved 23 teachers from various specialties, with different employment relationships (permanent, substitute) and employment in primary and secondary schools in Greece. All participants had previous experience with the use of various AI chatbots and were students of the postgraduate program "Digital and soft skills in educational sciences" at the International Hellenic University, which determines the geographical dispersion of the sample in various regions of the Greek territory. The interviews were conducted within the framework of the course "Critical Extensions of Digital Pedagogy".

MEASUREMENT INSTRUMENTS

Semi-structured interviews were used to collect data. This method was chosen due to its flexibility, which allows for in-depth exploration of the participants' views (Skouma & Mastrothanasis, 2024). The interviews included both closed and open-ended questions, with the possibility of modification depending on the course of the discussion. Closed-ended questions were used to collect specific, comparable information, ensuring a basic structure and consistency in the data. However, the real dynamic of the method emerged through the open-ended questions. These questions allowed participants to express themselves freely, develop their thoughts and offer detailed narratives, beyond the predefined frameworks.

The questions were organized into three main thematic sections. The first section addressed concerns about the negative impacts of AI chatbots and focused on issues such as the spread of misinformation, the risk of psychological dependence, the degradation of critical thinking, the impact on student-teacher interaction, the impact on mental health, ethical dilemmas and the reinforcement of social inequalities where unequal access to technologies can widen the gap between economic and social groups. The second section addressed preventive actions and solutions for managing risks, which were related to ensuring transparency, strengthening data protection, promoting collaboration and creating legal

frameworks. The third section of questions explored the roles and responsibilities of the various actors influencing the implementation of AI chatbots in education. Specifically, it explored the roles of teachers, parents, developers, and governments.

METHODOLOGY

The interviews were conducted on May 25, 2024, via an online videoconferencing platform, with the aim of collecting teachers' perceptions. Each interview lasted approximately 45 minutes. Participants were divided into small groups (three or four people) in virtual rooms. Discussions were recorded with OBS Studio.

After the interviews were conducted, the responses were transcribed and thematically coded, according to the data coding proposed by Isari and Pourkos (2015). The aim was to identify common themes and highlight the main perceptions and concerns of the teachers.

RESEARCH RESULTS

The analysis of the interview data revealed a wide range of perceptions among educators regarding the use of AI chatbots in education. While recognizing the significant potential they offer, serious concerns were also expressed about the potential risks and negative consequences of their careless or uncontrolled use.

The main concerns of teachers are related to inaccuracy and the possibility of misinformation. Concerns were expressed that the confusing or inaccurate information provided by these tools, due to the synthesis of various uncontrolled sources, may undermine the validity of the knowledge acquired by students *(... the confusion between real and imaginary with the violation of boundaries, that is, students and we do not ultimately know what is true, what is real, because information from various sources is combined, which has not been controlled ...*).

In addition, concerns were expressed about the possible depreciation of the role of teachers and their replacement by chatbots. Although the majority rejected the scenario of complete replacement, there was concern about shifting their role to that of "machine operator" *(... to overshadow people and take on another role... Regarding our position in schools, I am very afraid that we will take advantage of the situation and become machine animators... graduates may not find jobs later because AI can replace programmers and a bunch of professions that are being created in the field of Information Technology...*).

Particular emphasis was placed on the potential reduction in students' critical thinking due to over-reliance on chatbots (… I believe that some students do not realize that they may give incomplete answers or make mistakes or not answer in the appropriate way). Teachers expressed fears that immediate access to answers may inhibit the development of autonomous thinking, creativity and problem-solving skills, leading students to the "easy solution" (… it acts as a brake on creativity, in my opinion, and on critical thinking because the student does not think for himself, he simply waits for the machine to give him the answer …. while he should first train his own mind and then draw material based on Artificial Intelligence … It is the easy solution).

They also expressed ethical concerns, because the use of chatbots raises ethical issues, such as prejudice against certain social groups (*... I recently read somewhere that there can be what we call hidden prejudices in certain perspectives... that they are programmed with a specific algorithm to provide data*). Or bullying and violation of privacy (*a key ethical issue is the privacy aspect, in other words, the future use of the data that we very easily enter into these Chatbots, to put personal data, to put information about our students or anything else*) and copyright (*... the issue of copyright is a very big issue, I don't know, we discussed it when we were teaching whether there are copyrights in this, are there? I don't know*).

The negative impact on human interaction between students and teachers was also highlighted. The increased use of chatbots can limit personal communication and meaningful interaction, negatively affecting the learning process and the development of social and emotional skills. Other important concerns included mental health and addiction. That is, teachers were concerned about the potential for anxiety or even depression in students due to excessive use and dependence on technology. Ethical issues related to academic integrity, plagiarism and fraud, as well as the lack of transparency of algorithms were also mentioned. The risk of widening educational inequalities for students with limited access to technological infrastructure or appropriate education was highlighted (*at an AI conference, a prominent figure said that because the companies that produce this material are profit-oriented, there is a huge moral problem, that is, it will create huge moral problems and social inequalities*). Finally, the inadequacy of infrastructure and training was

mentioned and the necessity for appropriate technological support and continuous training of teachers for the effective use of AI was mentioned *(… we see it at older ages… Let alone a 68-year-old teacher having to keep up with all these tools in the classroom… We have a gap… Centrally… teachers need to be trained… technical equipment… special equipment is needed… insufficient access to media… this in itself creates inequalities*).

The teachers also suggested preventive measures and solutions, such as providing education to teachers, students and parents on the responsible and ethical use of AI (*I believe that parents should first be informed, educated, because most of them do not know many things … I think it is essential to involve parents, especially the younger the children are … It is a plan … it is in the Ministry's intentions to educate us on AI*). They pointed out that planning is needed with a focus on enhancing human interaction and not replacing it (*perhaps some teachers believe that they can be replaced by AI, but we will not get to that point*). They mentioned ensuring the transparency of algorithms, establishing strict data protection policies (*I believe that the state is responsible for the protection of personal data ... the one who will impose the framework is the state. The issue is legislative*), strengthening cooperation between all stakeholders (teachers, parents, programmers, governments) and forming a clear legal framework (*the Ministry needs to set a framework for how it can be used and whether it can be included in the educational process ... something institutionalized, that is, then training with specific demarcation, plan, goals, limitations ...*). The role of teachers as guides, instead of simple users of technology, was underlined.

CONCLUSIONS

Artificial intelligence (AI) has emerged as one of the most promising technologies in education, offering significant benefits and marking the beginning of a new era. Its presence will not be just a technological development, but it heralds a radical change in the way we learn and teach (Desyllas, 2022).. This research has shown that the path towards this change is a dual-nature development. It offers significant opportunities, but also entails various risks. The literature review, combined with empirical data from interviews with teachers, highlighted a wide range of challenges spanning pedagogical, ethical, legal, practical and technical issues.

Key concerns include the potential undermining of critical thinking, student dependency on technology, the threat of misinformation and algorithmic bias, which could exacerbate existing inequalities, negatively affecting vulnerable groups in terms of gender, ethnicity and socio-economic status. In addition, there are concerns about data privacy issues, as well as issues related to human interaction and the role of the teacher (Du Boulay, 2023). At the same time, the critical need for adequate technical infrastructure and continuous training of teachers was highlighted, so that they are able to effectively and responsibly utilize AI tools.

It is imperative to adopt a prudent and critical approach when introducing AI into education. The development of clear guidelines and policies is essential to ensure its responsible and beneficial use, with the aim of maximizing the advantages and minimizing the possible negative consequences. Cooperation between all stakeholders involved, namely teachers, parents, developers and government authorities, is crucial to the formation of a framework that will promote innovation while preserving the fundamental principles of pedagogy and ethics.

This study, by highlighting the perceptions of educators, contributes to enriching the dialogue on the responsible integration of AI in the modern educational environment. Continuous research and the implementation of best practices will allow the full potential of AI to be exploited for the benefit of students and the entire educational community.

ABSTRACT

This paper presents the methodology, results, and ongoing work of the AISE project (Artificial Intelligent platform to support Students by assessing their performance skills through predictive models created from their writing skills), funded under the Erasmus+ program. The project aims to apply state-of-the-art AI methods, especially retrieval-augmented generation (RAG) combined with Large Language Models (LLMs), for the automatic evaluation of student essays across three dimensions: Content, Organization, and Language. Essays were collected from secondary education students in Greece, Cyprus, Serbia, and Croatia, processed, and assessed using a modular AI pipeline. The results demonstrate high alignment with human ratings, especially in the Content dimension, while highlighting challenges in assessing linguistic subtleties. The AISE project paves the way for scalable, transparent, and personalized feedback systems in educational environments.

Keywords: Artificial Intelligence, Erasmus+, Language processing, Automatic Essay Scoring, Secondary Education.

INTRODUCTION

The rapid advances in Natural Language Processing (NLP) and AI have enabled the automation of complex educational tasks, including essay scoring. The AISE project, code 2023-1-EL01-KA220-SCH-000157157, addresses this challenge by developing an AI platform capable of automatically assessing secondary students' writing performance using advanced language models and structured evaluation criteria.

The AISE project is a European Erasmus+ Cooperation Partnership in the field of school education. It has been approved and funded by the Hellenic National Agency Erasmus+ (State Scholarships Foundation - IKY). The project is coordinated by the Diefthinsi Defterovathmias Ekpaidefsis Nomou Prevezas, Greece, and its partners include:

- International Hellenic University (Greece)
- Ionian University (Greece)
- University of Kragujevac (Serbia)
- City of Kragujevac (Serbia)
- University of Rijeka (Croatia)
- Ministry of Science and Education of Croatia, replaced by CARNET, (Croatia)
- 3rd Technical and Vocational School of Education and Training of Limassol (Cyprus)
- DOUMAG LTD (Cyprus)

The deployment of artificial intelligence (AI) in educational assessment accelerates marking while enriching the depth, consistency, and timeliness of feedback, ultimately fostering student growth. Within this landscape, Automated Essay Scoring (AES) stands out as a flagship application (Shetty et al., 2022) serving a key role in meeting the objectives of the AISE project. Early AES research relied on hand-crafted linguistic rules. Burstein et al. (1998), for example, built e-rater around syntactic, rhetorical, and topical features; their work showed that combining computational-linguistic indicators with statistical modelling could match human graders closely, making the system a credible "second reader" for high-stakes tests.

Since then, scores of studies have tried to capture higher-order qualities such as cohesion, relevance, and coherence—still formidable challenges. Surveys by Ramesh & Sanampudi (2021) and González-Calatayud et al. (2021) reveal that most systems emphasize style-based cues, with fewer tackling deep content evaluation. The latter review distilled 454 papers down to 22 key studies, underscoring the momentum behind AES for formative assessment: AI systems can return immediate, multidimensional feedback that helps learners revise in real time—provided they are grounded in sound pedagogical principles, not just technical accuracy. Recent work drives beyond rule-based methods. Kumar & Boulanger (2020) trained an AES model on a large corpus and scored essays across four rubrics—ideas, organization, style, and conventions—using linguistic indices to generate pointed, standards-aligned feedback. Likewise, Grivokostopoulou et al. (2016) combined interactive visualizations with automatic marking for search-algorithm exercises, reporting high agreement with human graders and measurable learning gains.

AI is also reshaping broader learning environments. Goel & Joyner (2017) embedded "nanotutors" into an online Knowledge-Based AI course, where automated micro-feedback contributed to online students outperforming their on-campus peers. Choi & McClenen (2020) fused Computerized Adaptive Testing with Dynamic Bayesian Networks to deliver personalized, diagnostic feedback in e-learning, while Ouguengay et al. (2015) applied a neuro-fuzzy inference system to gauge literacy skills in Amazigh within a learning-management system.

Two dominant technical paradigms now define AES research:

Large Language Models (LLMs)

Studies using GPT-3 (Mizumoto & Eguchi 2023), GPT-4 (Kostić et al. 2024), PaLM 2, Claude 2, and others (Pack et al. 2024) demonstrate that powerful generative models can approximate, and sometimes surpass, human scoring—though stability over time and across contexts remains a concern. Song et al. (2024) showed that open-source LLMs, combined with zero-shot, few-shot, or parameter-efficient tuning, can offer cost-effective essay scoring and revision support.

Feature-extraction approaches

When annotated data are scarce, systems that leverage educator-defined indicators still perform competitively and offer greater interpretability. Yang et al. (2019), for instance, blended shallow and deep semantic attributes to grade Chinese essays and supply constructive feedback.

In short, while large, data-hungry LLMs excel when ample training material exists, feature-driven or hybrid models remain valuable for low-resource settings or languages. The literature also highlights the importance of integrating pedagogical design, ensuring that automated scores translate into actionable, learner-centered feedback. These insights directly inform the AISE project's choice of a Retrieval-Augmented Generation framework, which combines the adaptability of LLMs with curated, educator-vetted exemplars to produce transparent, reliable, and scalable essay assessments.

PROJECT GOALS AND CONTEXT

The aim of the project is to apply Artificial Intelligence (AI) methods to create a platform capable of supporting the assessment of students' language skills in secondary education across four EU countries, namely: Greece, Cyprus, Serbia, and Croatia. To achieve this, data mining models utilizing various artificial intelligence technologies will be designed and applied. A key objective is to create predictive models that effectively assess students' skills. The project includes a data collection phase, in which sets of annotated written texts will be collected from high-school students and will be used for training and evaluating the AI models. To facilitate the data collection process, a collaborative cloud-based software platform will be developed to systematically register and store all collected student data, ensuring efficient tracking and analysis. In the data processing aspect, various AI techniques will be applied to unstructured text, collected by educators from the participating countries, in order to identify patterns and extract valuable insights.

The main activities focus on scientific research studies involving secondary education students, conducted through essays at different time periods by educators from participating European schools. State-of-the-art AI methods will be utilized to develop, evaluate, and validate highly scalable models.

METHODOLOGY

The methodology of the AISE project is structured into a set of interlinked phases, combining educational research, computational linguistics, and system engineering. The project's core aim is the development of a scalable and explainable Automated Essay Scoring (AES) platform that leverages state-of-the-art AI techniques to assess student writing across three dimensions: Content, Organization, and Language.

Preliminary Analysis and Literature Review

The first phase involved a comprehensive review of existing AI methodologies for writing skill assessment. This included a comparative analysis between two primary technological paradigms: Feature-based approaches, which rely on predefined linguistic and stylistic indicators (e.g., syntactic variety, lexical richness, cohesion metrics). Neural network–based methods, primarily centered around Large Language Models (LLMs), which learn from data patterns without explicit rule encoding. This review informed the project's decision to adopt a Retrieval-Augmented Generation (RAG) strategy—a hybrid solution that enriches LLM prompts with relevant, high-quality examples from an external knowledge base. This approach was selected to address key challenges in AES, including generalization across multilingual inputs, explainability, and alignment with pedagogical standards.

Project Requirements and Infrastructure Development

Following the conceptual foundation, a requirement analysis was conducted to define the functional and non-functional specifications of the platform. This phase involved all project partners and led to the development of:

- A cloud-based platform for secure essay storage and processing.
- A modular system architecture, enabling the separation of the essay evaluation pipeline into distinct stages.
- Text curation and harmonization workflows using AI-powered tools to clean, normalize, and annotate the collected data.

The platform was designed to support multilingual input, data de-identification, educator dashboards, and API endpoints for real-time interaction with the essay assessment engine.

Data Collection and Pre-processing

A key component of the AISE project was the establishment of a cloud-based platform designed to support the secure, structured, and collaborative collection of student essays across four participating countries: Greece, Cyprus, Croatia, and Serbia. The platform was developed to:

- Enable educators to upload essays in standardized formats (.docx or .odt).
- Associate each submission with anonymized metadata, including school ID, student code, essay prompt, and evaluation scores.
- Facilitate real-time monitoring of submissions, version tracking, and grading completeness.
- Support multilingual data inputs, ensuring language-specific encoding and compatibility.

At the first stage, essays were collected from secondary school students across four European countries: Greece, Cyprus, Croatia, and Serbia. Each essay included:

- Prompt (topic/question).
- Body (student response).
- Grading metadata (human scores in three dimensions).

All texts underwent anonymization, language normalization, and structuring into a three-part schema to ensure consistency across countries and grading teams.

Grading Schema and Label Encoding

Teachers assigned scores to each essay in the following dimensions:

- Content (maximum 40 points).
- Organization (maximum 30 points).
- Language (maximum 30 points).

These numeric scores were converted into qualitative categories—Excellent, Very Good, Good, and Marginal—based on standardized thresholds, ensuring a harmonized evaluation framework. Each essay was tagged with a combined label (e.g., "Very Good–Good–Excellent") to facilitate stratified sampling in subsequent stages, as it can be seen in the table (Table 1) below.

Table 2
Grade categories and related score ranges for each evaluation dimension

Grade	Content (40 pts)	Organization (30 pts)	Language (30 pts)
Excellent	31 – 40	24 – 30	24 – 30
Very Good	21 – 30	18 – 23	18 – 23
Good	11 – 20	11 – 17	11 – 17
Marginal	1 – 10	1 – 10	1 – 10

Train/Test Split Strategy

To ensure statistical validity and prevent data leakage, a stratified train/test split was performed using the combined qualitative label as the stratification key. Essays with rare combinations (i.e., unique or very low-frequency grade triads) were excluded from model training. The test set was completely isolated and never used during training, embedding, or retrieval, ensuring strict generalization and fairness.

Construction of Knowledge Bases

Three dimension-specific knowledge bases (KBs) were constructed—one each for Content, Organization, and Language. For each essay in the training set, the relevant body text and its qualitative grade were embedded using the MiniLM-L6-v2 transformer model, a light-weight and performant sentence encoder. These embeddings were indexed using FAISS, an efficient vector similarity search engine.

This architecture enables fast semantic retrieval of the top-k most similar training examples during model inference. Crucially, each dimension's KB is completely isolated, avoiding cross-contamination between grading criteria.

Retrieval-Augmented Generation (RAG) Models

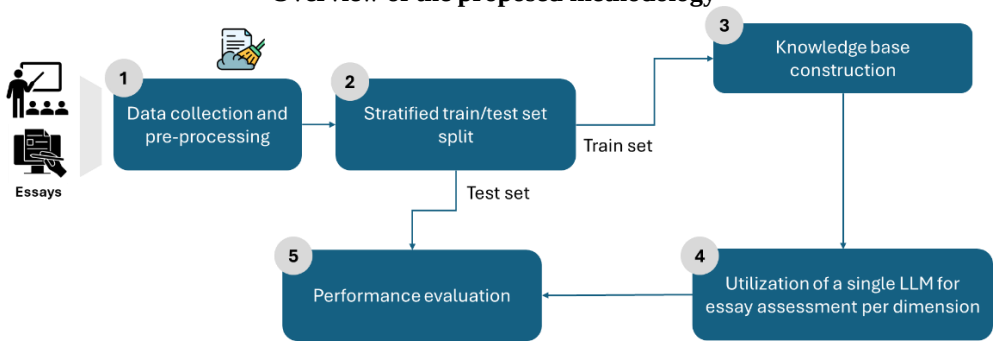
At the heart of the platform are three LLM-based essay assessment modules, each tailored to a specific evaluation dimension. These modules are built upon DeepSeek-V3 (671B parameters) and operate within a RAG framework: At inference time, a new essay is embedded and used to query the relevant KB. The most similar annotated examples are retrieved and passed—along with the essay—to the LLM. A dimension-specific prompt template guides the model to produce a grade and rationale based on aligned pedagogical expectations. This design enables the LLM to contextualize grading, reduce hallucination, and generate traceable reasoning backed by real student examples.

Educational Research Integration

Parallel to the system development, the project initiated on-site educational research in all participating countries. Secondary school students contributed essays across different time periods. Educators participated in grading calibration workshops, feedback studies, and system evaluations. This research component supports:

- Cross-country alignment of grading standards.
- Real-world validation of AI predictions.
- The collection of educator and student feedback for platform refinement.

Performance Evaluation and Metrics



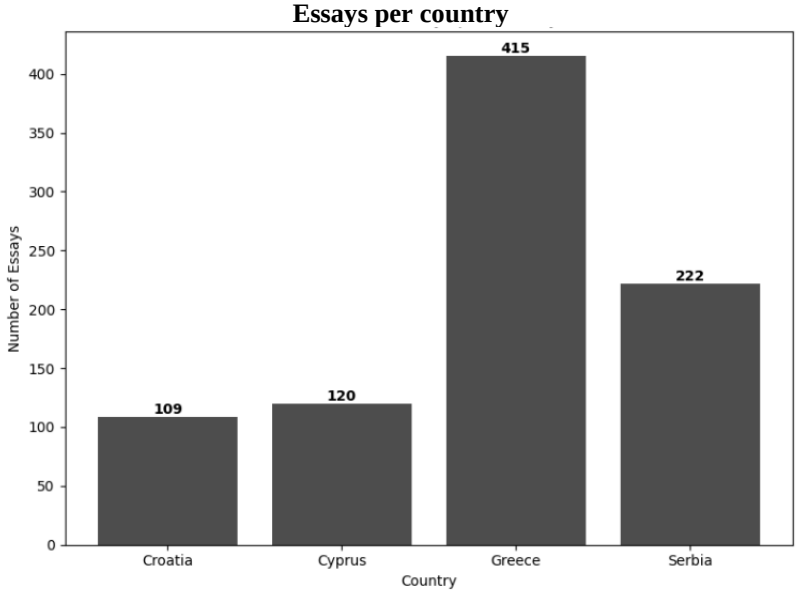
Each LLM was evaluated using the unified test set, with predicted grades compared against human-labeled ground truth. Metrics computed per dimension included:

1. Accuracy.
2. Macro Precision / Recall / F1-Score.
3. Balanced Accuracy.
4. Confusion Matrices to visualize prediction distributions.

Initial results revealed very high performance in the Content dimension (Accuracy: 0.976), strong performance in Organization, and more modest outcomes in Language—highlighting the complexity of capturing grammatical subtleties.

This multi-phase methodology ensures that the AISE system is transparent, modular, multilingual, and educationally grounded, capable of offering automated, yet interpretable, writing assessment aligned with European pedagogical standards. In the (Image 1), the overview of the proposed methodology is depicted.

Image 1
Overview of the proposed methodology



RESULTS

The first stage of essay collection resulted in a dataset of 866 student essays, gathered through coordinated efforts across the participating countries. Most submissions were received in .docx format, with a smaller number converted from .odt. Originally handwritten by students, the essays were later digitized by educators at the respective schools and uploaded to the project's cloud-based platform. Each essay was manually evaluated by teachers based on three standardized dimensions: Content (maximum 40 points), Organization (maximum 30 points), and Language (maximum 30 points). These numerical scores were subsequently mapped to four qualitative categories—Excellent, Very Good, Good, and Marginal—to facilitate interpretable, categorical classification by the AI models. All essays adhered to a consistent structural template, typically comprising an introduction, a main body, and a conclusion, which ensured

comparability across submissions and supported both human and automated analysis. This well-structured, annotated corpus serves as a representative and pedagogically grounded resource, reflecting writing diversity across countries while enabling reliable and scalable essay evaluation using retrieval-augmented large language models (LLMs).

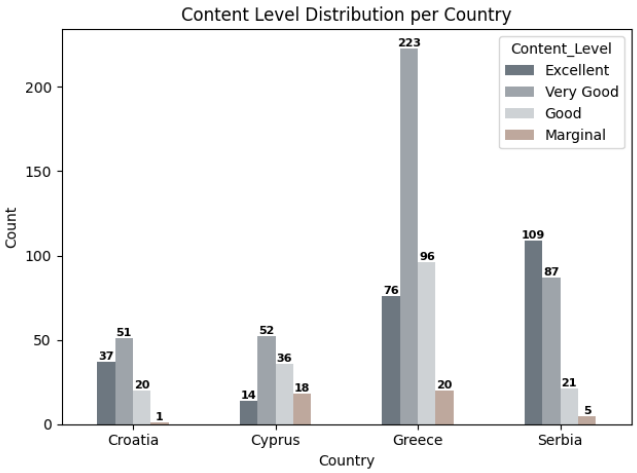
The initial essay corpus assembled during the first stage of data collection reflects a broad geographical distribution, capturing student writing samples from four European countries participating in the AISE project. Of the 866 total essays, the majority—415 submissions—originated from Greece (specifically from DDE Prevezas), followed by 120 from Cyprus, 109 from Croatia, and the remainder from Serbia or mixed/unspecified contributors (Image 2). This cross-national diversity is essential for developing a generalizable and robust AI-based assessment framework, capable of handling variations in student writing styles, linguistic features, and educational practices. Notably, preliminary analysis revealed country-specific grading trends: for example, essays from Greece showed a higher proportion of Very Good ratings, while those from Cyprus received fewer Excellent scores across all evaluation dimensions. Such disparities underscore the importance of applying stratified sampling techniques during the train/test data split (as described in Stage 2), in order to prevent model bias and overfitting dominant patterns from a single region. Furthermore, this geographic breakdown provides a valuable foundation for future research on regional grading behaviors and opens possibilities for adapting AI-generated feedback to align with national curricula and localized writing norms.

Image 2
Essays per country

The distribution of qualitative grades across countries for the Content dimension is presented below (Image 3). The data indicate that Greece contributed the majority of essays rated as “Very Good,” with a substantial portion also falling into the “Excellent” category. Cyprus and Croatia displayed more conservative grading patterns, with fewer essays achieving the highest grade level. The relatively low number of “Marginal” grades across all countries may point to selection bias or generally high writing proficiency. These patterns highlight the need for grade-balanced sampling to ensure that the AI models do not inherit country-specific biases when learning how to assess idea relevance and development.

Each entry in the dimension-specific knowledge base (KB) consists of a student essay excerpt paired with its corresponding qualitative grade for one of the three evaluation dimensions (Content, Organization, and Language) (Image 4). This structure reflects the modular design of the proposed workflow, where a separate KB is constructed per dimension to ensure targeted retrieval during the RAG process. The example illustrates how labeled writing samples are stored in a vectorized format, allowing the system to semantically retrieve the most relevant examples during inference. These retrieved entries serve as contextual anchors, helping the LLM generate informed, transparent, and pedagogically aligned grade predictions. The AISE KB architecture supports dimension-level isolation, country-based indexing, and interpretability, making it a critical component of the pipeline's explainability and adaptability. During model inference, the test essay is embedded and compared against this vector store, retrieving the top-k most similar examples. These are then integrated into a custom prompt, specific to the evaluation dimension, and passed to the DeepSeek-V3 LLM to guide the grading process.

Image 3
Grade distribution by country and evaluation dimension



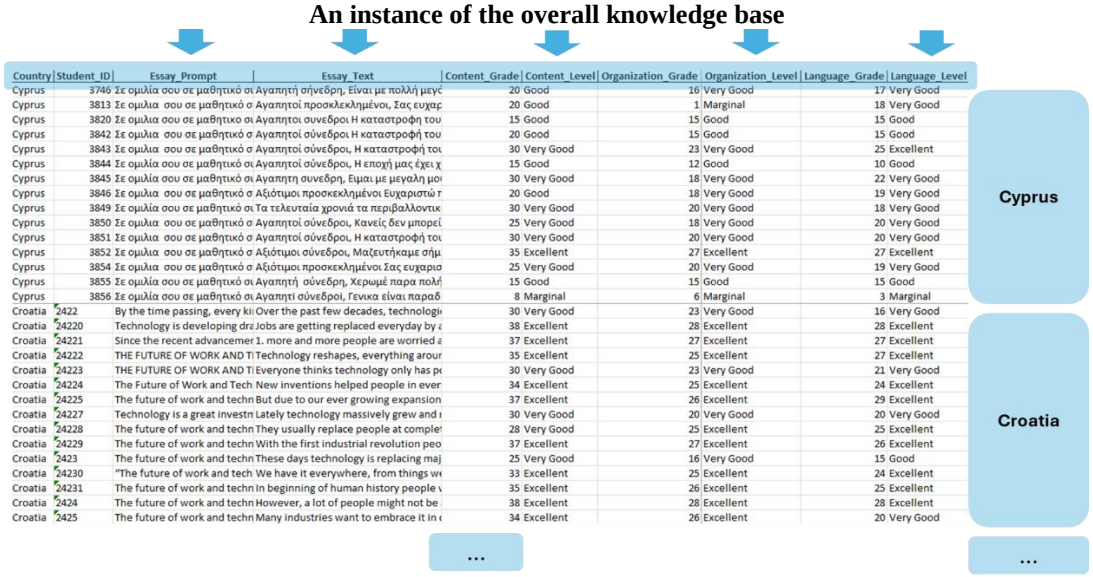


Image 4
An instance of the overall knowledge base

The evaluation of the RAG-based LLMs was conducted using a unified test set, in which each essay was independently assessed across the three evaluation dimensions—Content, Organization, and Language—by its respective dimension-specific model. Each model generated a prediction in the form of one of four qualitative grades: Excellent, Very Good, Good, or Marginal. These predictions were then compared against the grades assigned by human teachers to measure alignment.

As detailed in Table 2, the LLM assigned to the Content dimension demonstrated exceptional performance, achieving an accuracy of 0.976, macro precision of 0.988, and macro F1-score of 0.911. These results indicate a very high level of agreement with teacher evaluations. The model evaluating Organization also performed well, reaching an accuracy of 0.780 and showing strong macro recall (0.844), suggesting effective recognition of structural aspects such as coherence and logical flow.

In contrast, the model responsible for assessing Language achieved a slightly lower accuracy of 0.769, with macro recall at 0.587 and macro F1-score at 0.603. These figures reflect greater difficulty in consistently capturing nuanced linguistic features such as grammar, vocabulary precision, and stylistic variation. Such challenges may stem from increased variability across languages and countries, or from the need for more granular prompt engineering and enhanced retrieval mechanisms in this dimension.

Table 2
Performance metrics per evaluation dimension

Metric	Content	Organization	Language
Accuracy	0,976	0,780	0,769
Macro Precision	0,988	0,684	0,626
Macro Recall	0,875	0,844	0,587
Macro F1-score	0,911	0,709	0,603
Balanced Accuracy	0,875	0,844	0,587

CONLUSIONS AND FUTURE STEPS

The adopted methodology successfully integrates technical sophistication with educational applicability, ensuring that the AI-based assessment process remains both effective and pedagogically grounded. Its modular design enables targeted improvements, scalability, and future integration of more advanced or specialized language models without overhauling the entire application. While the application has demonstrated strong performance in Content evaluation, particularly in assessing idea development and relevance, the Language dimension remains more challenging. This highlights the need for ongoing enhancements in prompt design, as well as the incorporation of richer and more diverse linguistic datasets to better capture grammatical and stylistic nuances across languages. These insights will guide the next steps of development, including the refinement of the language assessment module and the continued expansion of the annotated essay corpus.

The parameter scales of several widely recognized Large Language Models (LLMs) that were evaluated during the development of the AISE pipeline, are outlined in Table 3 below. Among these, DeepSeek-V3 was selected for initial deployment due to its favorable trade-off between accuracy and computational efficiency. It offers competitive performance, fast inference times, and lower hardware requirements, making it well-suited for scalable educational applications. While more advanced models such as GPT-4 and GPT-4-Turbo have the potential to significantly enhance classification accuracy, their integration poses challenges related to increased computational costs and deployment complexity. As a result, their use is currently under consideration for future phases of the project.

Looking ahead, the project will focus on expanding the dataset, with particular emphasis on enriching the underrepresented “Marginal” category. This is expected to improve model generalization and ensure a more balanced classification across all performance levels. A critical development milestone involves the integration of the AISE essay evaluation engine into the cloud-based platform via API, enabling real-time grading and personalized feedback delivery directly to students and educators.

In parallel, further experimentation with next-generation LLMs—including GPT-4-Turbo—and parameter-efficient fine-tuning techniques is planned to improve scoring accuracy and feedback granularity. Early results already confirm the system’s capability to generate dimension-specific grade predictions and formative, pedagogically aligned suggestions, establishing a strong foundation for AI-driven personalized writing support in secondary education.

Table 3
An overview of Large Language Models (LLMs) considered for AISE essay evaluation (the selected model is shown in bold)

LLM type	Number of parameters
DeepSeek-LLM (67B)	67 billion
DeepSeek-V2	236 billion (21B activated/token)
DeepSeek-V3 (deepseek-chat)	671 billion (37B activated/token)
GPT-2	1.5 billion
GPT-3 (Davinci)	175 billion
GPT-3.5 Turbo	175 billion (optimized)
GPT-4	~1 trillion (estimated)

ABSTRACT

This paper focuses on the role of AI as a valuable tool in English language learning, assisting teachers in their multifaceted roles. Generative AI can assist in the creation of vocabulary/grammar/speaking exercises or dialogues (in an "open" curriculum), or the adaptation of existing ones (in "fixed" curricula), based on the teaching situation and learners' profiles. However, it is important to state that AI-assisted activities need to conform to methodological criteria. The AIATAC framework was inspired by the fact that trainee English teachers at Master's level at the Hellenic Open University reported using AI to design image-enhanced task sheets, as part of their lesson planning. Content analysis of such lesson plans was conducted, and the results were evaluated as positively correlated with increased student motivation and participation in class. Subsequently, the AIATAC framework was conceptualized as a result of the realistic need to extend and apply AI-assisted task adaptation or creation, in a principled manner, conforming to the methodology of the teaching of English as a Foreign Language. The AIATAC framework can also be applied to the teaching of English for Specific/Academic Purposes (ESP/EAP) or even EMI (English as a Medium of Instruction). This possibility is currently under consideration at the University of Ioannina, as part of teaching ESP at the Department of Accounting and Finance, which involves integrating AI into the synchronous (class/IT lab) and asynchronous (self-study/ecourse) components, using generic or more specific AI applications. The AIATAC framework can best be implemented in a laboratory with the required equipment, offering students access to applications and online tools. In the paper, it is analyzed how this pilot framework can be used in a methodologically appropriate way.

Keywords: English language teaching, generative AI, context-specific, task creation/adaptation, AIATAC framework.

INTRODUCTION

This paper is based on the premise that a course consists of "teaching experiences". This dimension of "experiential learning" cannot be provided by AI independently because it cannot take the initiative to create such synchronous reciprocal experiences as a human being can. Most importantly, it lacks something equivalent to "human agency" (Bandura, 2001) that can offer guidance or even self-guidance (also known as "self-regulation" in the field of educational psychology) without having to be "prompted" by someone else; this is what determines self-efficacy and makes things happen. AI should, therefore, be considered in its proper dimensions, as a medium in the Industry 4.0 era, or a valuable tool, assisting teachers in their multifaceted roles as pedagogues, instructors, mentors, facilitators, communicators, class managers, motivators, and more.

THE NEED FOR A FRAMEWORK

It is important to establish when, where, and how teachers (and/or learners) can work with AI, so as not to cross red lines that pose ethical issues (such as plagiarism), or compromise the necessary painstaking objectives that a cognitively demanding task that requires *hard focus* (Sifakis and Georgountzou, 2004/2018, p. 220), for instance, is intended to accomplish. This is an issue that pervades the human-AI framework of collaboration, and this is why a sound methodological approach would prove to be beneficial, especially in relation to foreign language teaching, which is the focus of this paper.

THE TEACHING CONTEXT

A curriculum can be either fixed ("core") or open (more learner-centred). Extremes can be too restrictive ("teacher proof") or too chaotic and labour intensive (Spinthourakis, 2004). In English language teaching, a fixed curriculum allows for adaptation of existing vocabulary/grammar/speaking exercises or dialogues, etc., while an open curriculum gives scope for the creation of new ones, based on the teaching situation and the class or learners' profile (Sifakis and Georgountzou, 2004/2018, pp. 39-52). Another way to describe such approaches is to refer to linear vs. non-linear learning; obviously, in the second case learners are given more scope for creativity, innovative thinking and challenging vistas.

METHODOLOGY FOR ORACY SKILLS DEVELOPMENT

Nation (1989) and Johnson (1982) propose applying certain criteria in order to enhance communicative interaction in class. In that respect, the teacher has more tools in order to adapt material or create new activities involving: information gap, information transfer, applying the jigsaw principle in order to promote cooperative learning, and also including procedures and challenges into a lesson plan more effectively and efficiently.

Given, also, that technology nowadays offers numerous opportunities for multimodal learning experiences, AI can help in that direction, too, by combining text with image/video and sound, as long as the teacher understands how - and intends to - use it creatively in his or her lessons. Examples include:

a. Creation of image-enhanced task sheets (by using DALL-E 3 in Copilot/Office 365 or Imagen in Gemini) that motivate students to engage more meaningfully in activities and provide enhanced comprehension of the instructions (Canva is also great for designing). Notably, the process of writing prompts for AI to generate an image corresponds to Johnson's principle of "information transfer" (from one means to another, i.e. from written form to image, in this particular case).

b. Condensing large texts in order to enhance students' comprehension and adapt more difficult or specialized passages for specific teaching contexts (or use "Grammarly" to edit text). This will help accelerated learning by turning longer texts into more "manageable" ones, in order to facilitate comprehension and promote meaningful interaction (possibly creating an "information gap" activity, as well), based on their content and specific information that students may be assigned to find (engaging, for instance, in a role play afterwards).

c. Blending teaching with "fictional" elements; for instance, by creating scripts of imaginary dialogues between teacher and student(s) or between learners (in ChatGPT, Copilot, or Gemini), and assigning targeted tasks for pair-work or group-work and, thus, providing "augmented" engagement experiences in class. Specific tasks may also involve:

-Listening to videos from YouTube (or podcasts) and creating communicative situations.

-Dramatization or simulation (Littlewood, 1981), bringing students closer to real-life situations, which is always intended in foreign language teaching.

The above approach follows closely the principles of communicative syllabus design and methodology and conforms to a progressivist, learner-centred approach (Clark, 1987).

THE AIATAC FRAMEWORK

The AIATAC framework was inspired by the fact that trainee English teachers at Master's level at the Hellenic Open University reported using AI to design image-enhanced task sheets, as part of their lesson planning. Content analysis of such lesson plans and task sheets from six past semesters has revealed that the applications mostly used were Canva and Dall-E 3, and the results are evaluated as positively correlated with increased student motivation and participation in class. Subsequently, the AIATAC framework was conceptualized as a result of the realistic need to extend and apply AI-assisted task adaptation or creation, in a principled manner, conforming to the methodology of the teaching of English as a Foreign Language.

SCOPE OF THE AIATAC FRAMEWORK

The AIATAC framework can also be applied to the teaching of English for Specific/Academic Purposes (ESP/EAP) or even EMI (English as a Medium of Instruction). This possibility is currently under consideration at the University of Ioannina, as part of teaching ESP at the Department of Accounting and Finance, which involves integrating AI into the synchronous (class/IT lab) and asynchronous (self-study/ecourse) components, using generic or more specific AI applications, such as: ChatGPT, Copilot, Canva, Dall-E 3, DeepL, Grammarly, RoadtoGrammar, Perchance, etc. The AIATAC framework, which ideally should involve collaboration with an IT expert, allows instructors to use their imagination in lesson planning and provide more focused and motivating, context-adapted activities, based on communicative syllabus design and methodology.

The use of technologies such as deep learning (Yuxiu, 2024) in AI translation, in particular, provides unparalleled benefits, given also that several researchers view translation as a useful "fifth skill" (Stibbard, 1998, p. 71, in Tagkas, 2024, p. 150), in addition to the four macro-skills (reading, writing, listening, speaking). In grammatical terms, it is important for EFL students to realize that the word order of their native language may differ from the English language (in English, the order is subject–verb–object) (see Maratsos, 1998). Thus, syntax allows them "to understand 'the cat ate the mouse' as a logical statement, and 'the mouse ate the cat' as unlikely" (Duchesne et al., 2022), as the words are ordered in such a way that meaning cannot possibly be confused. However, in Greek it would be possible to change the word order without changing the meaning, because in the Greek language the subject of the sentence is always in the nominative case, while the object is in the accusative case and can, therefore, be easily identified, even if it precedes the verb (in contrast, English relies on word order - not cases - to determine which noun is a subject or an object). AI applications such as DeepL or RoadtoGrammar, etc. can help students master the intricacies of contrastive analysis of the two language systems and enhance their awareness and ability to form grammatically correct sentences.

STRUCTURE OF THE AIATAC FRAMEWORK

AI can be a great tool, as long as properly engineered prompts are used. However, the content created by AI often lacks "authenticity" and should be checked and post-edited by a human "editor", so as to ensure credibility and compatibility.

The AIATAC framework can best be implemented in a laboratory with the required equipment, offering students access to applications and online tools, or specialized software, which would enhance their literacy and help them to engage more meaningfully in a (mediated or not) student-teacher interaction.

DRAWBACKS OF ARTIFICIAL INTELLIGENCE

Undoubtedly, the fact that this form of intelligence is "artificial" implies that it cannot protect itself from some dangerous practices that are regarded as sub-standard in terms of academically accepted "specifications". Some drawbacks of AI, as Straubhaar et al. (2024) indicate, are that it cannot nuance writing and tone/context (although, we believe, this is rapidly changing); it cannot replace human judgment and independent thinking; it can get facts wrong and may be biased, based on what it can access on the internet; in addition, it may commit plagiarism, while it also fails to tell the difference between fact and fiction (which entails the risk of misinformation). In fact, as McCloud (2023) supports, AI does not actually cite or attribute its information and, when asked, it often provides invalid or inaccurate sources. All of the above-mentioned drawbacks can be potentially dangerous. This implies that AI can be helpful in drafting documents which, however, need to be checked by an expert human practitioner who will be able to approach them from different angles and examine their correctness, validity, credibility, and so on.

Therefore, the theoretical approach to the use of AI should involve its treatment as a versatile "tool"- but without abusing its capabilities or attributing to it any supreme powers that it may not possess, or even treating it as a reliable "partner" (at least not without double-checking its findings or diverse creations).

BENEFITS OF THE AIATAC FRAMEWORK

Adding structure is essential in order to avoid circumstantial (or "disoriented") initiatives that may prove to be less fruitful than their intended outcome. The AIATAC framework is suitable for small scale or large scale use, depending on the context and level of students (an AI tool for checking the CEFR level of a text is available at: http://www.roadtogrammar.com/textanalysis/).

The benefits of the AIATAC framework are that it is:

Practical: it can be easily used and can offer an array of available AI tools, depending on the context/lesson objectives.

Reflective: it gives teachers the opportunity to reflect on their teaching practices and make the necessary adjustments.

Flexible: It can adapt to different contexts - from general EFL to ESP/EAP/EMI, etc.

Effective: It can have a considerable impact on the class dynamics by accelerating the learning process and facilitating the teacher's role, while enabling learners to engage in activities in more meaningful ways.

Dynamic: It can be further developed, as new applications and tools can be added to the list of available options, depending on the context/level/criteria, as outlined in the framework.

By applying the AIATAC framework, EFL teachers and/or ESP/EAP instructors have a basis for a more focused and meaningful integration of (and interaction with) AI. Finally, it should be noted that the framework is also compatible with "self-regulated learning" practices (Kitsantas et al., 2013), which means that self-study can acquire a more empowered and entertaining character, as learners can be guided on how to use AI applications effectively in order to improve their knowledge and build their macro- and micro-skills.

PROSPECTS FOR DEVELOPMENT OF THE AIATAC FRAMEWORK

Ideally, the AIATAC framework could be further developed into a Web based "matching tool", pairing skills development criteria with available AI applications in order to guide EFL/ESP/EAP instructors in regard to designing their lessons and adapting or creating context specific tasks, according to students' level or profile and curriculum/syllabus objectives. We believe that this possibility would be best implemented as part of an Erasmus+ project, for example, or other suitable projects related to education and/or information technology.

CONCLUSIONS

Taking into consideration the prospects of "upskilling" or "reskilling" (as opposed to "deskilling"), which are necessary steps in order to adjust to the new requirements of the 21st century and Industry 4.0, the AIATAC framework provides an opportunity to join forces with IT/AI specialists (who could also offer students more specialized knowledge about how to use AI tools and applications) and, thus, turn EFL into a more meaningful, as well as effective and efficient process, either in class (face-to-face) or in distance-learning contexts.

In other words, educators need to start thinking "outside the box", in the sense that they should also take advantage of (or create) opportunities for collaboration and synergies with IT specialists and other instructors; together, empowered also by AI applications, they will be able to contribute to the advancement of teaching and learning (English language learning, in our case) by means of the new technological possibilities that are available to members of the educational community in the Industry 4.0 era.

ABSTRACT

This paper studies the interaction of children aged 5-12 years with a modern mechatronic system by comparing the results obtained from three usability assessment tools. The mechatronic system is an autonomous robotic vehicle that was built with the help of the Lego Mindstorms EV3 Education educational package. The construction is used by 100 children aged 5-12 years in three scenarios of different difficulty and then each of these children answers three questionnaires. The first questionnaire that assesses usability is the SUS (System Usability Scale) and consists of 10 questions, the second is the USE (Usefulness, Satisfaction, Ease of Use) which consists of 30 questions which are divided into four sections and assess usefulness, ease of use, ease of learning and satisfaction respectively. The third questionnaire was created and adopted from previous research (Tsagaris, 2023) and consists of 20 questions divided into four sections assessing effectiveness, efficiency, satisfaction and ease of use.

The survey included a sample of 100 children, aged 5-12 years (5-6 48%, 7-8 26%, 9-10 16%, 11-12 10%), of whom 84% were boys and 16% were girls, of whom 48% reside in western Thessaloniki and 52% reside outside Thessaloniki. From the results of the first questionnaire (SUS), one concludes that the use of the mechatronics system creates the will for frequent use (94% Agree), is not complicated (80% Agree), exudes confidence during use (98% Agree) is easy to learn (70% Agree), and that for the younger ages of 5-6 years, unlike children 11-12 years, the assistance of a technician is required to use it.

According to the results of the second questionnaire (USE), in its first section assessing Usability, 92% agree that it helps them be more efficient, 98% agree that it is useful and 98% also agree that it does everything they expected it to do. In its second section assessing Ease of Use, 92% say that it is easy to use, 94% agree that it is user-friendly, 96% state that it is flexible and that they can recover from mistakes quickly and easily. In its third section assessing Ease of Learning, 90% easily remember how to use it and 80% state that it is easy to learn and use. The fourth and final section of the second questionnaire assesses Satisfaction, with 100% stating that they are happy with the interface, 96% saying they would recommend it to a friend and 98% saying it is great.

As for the third questionnaire, in the first five questions assessing Effectiveness, 96% disagree that mistakes are made during interaction, while 100% agree that the interface works as expected. In its second section, which concerns Efficiency, 100% agree that interaction is easy and 92% agree that there is freedom of movement for the user. Satisfaction is what is assessed in the third section of the questionnaire, with 100% agreeing that operating the system is not tiring and that changing the command is easy, while in the fourth section, which assesses Ease of Use, 96% state that it is flexible in selecting movements, 100% that the commands are memorable, and that training is easy.

Keywords: Educational Robotics, Mechatronics Systems, Usability Assessment

INTRODUCTION

The field of robotics has transitioned from simple educational tools to complex mechatronic systems that significantly impact various industries. This evolution is not merely technological; it reflects changes in educational paradigms, societal needs, and the integration of interdisciplinary approaches. Understanding this progression provides insight into how robotics has become an essential component of modern education and industry. Educational robotics began in the late 20th century, aimed primarily at introducing students to the principles of programming and engineering. Early systems, such as LEGO Mindstorms, allowed students to build simple robots and program them to perform basic tasks. These tools were designed to enhance problem-solving skills, creativity, and teamwork among students (Kalogeras and Papadopoulos, 2017).

The primary goal was to make learning engaging and interactive. As educational robotics gained popularity, educators recognized its potential to bridge the gap between theoretical knowledge and practical application. Students could see the results of their programming in real-time, fostering a deeper understanding of concepts such as algorithms and mechanical design. As technology advanced, so did educational robotics. The introduction of sensors, actuators, and more sophisticated programming environments transformed how students interacted with robotic systems. Robots began to incorporate features such as vision systems, touch sensors, and even artificial intelligence, allowing for more complex interactions and behaviors. These advancements meant that educational robotics could be used to teach more than just basic programming. Topics such as data analysis, machine learning, and systems engineering became integrated into robotics curricula. Consequently, students were not only learning how to build and program robots but also how to analyze data and make informed decisions based on their findings.

The transition from educational robotics to mechatronic systems represents a significant shift in focus. Mechatronics combines mechanical engineering, electronics, computer science, and control engineering. This interdisciplinary approach allows for the development of systems that are not only automated but also intelligent. In this context, mechatronic systems are used in various applications, including manufacturing, healthcare, and transportation. For example, robotic arms used in assembly lines are mechatronic systems that enhance efficiency and precision. In healthcare, robotic surgical systems provide surgeons with enhanced capabilities, improving patient outcomes (Tsagaris, 2019).

The term "mechatronics" was first adopted by Tetsuro Mori, an engineer at the Japanese company Yaskawa Electric Company Ltd., in the late 1960s. The word mechatronics is formed from the letters of the English words "MECHAnical Systems and elecTRONICS." Japanese engineers quickly realized that flexible and intelligent systems would dominate all sectors of economic and social life, such as industrial production, national defense, aerospace, transportation and networks, smart home and consumer devices, and more. The rapid development of industrial products and technological systems by Japanese industry—which combined various technologies (electromechanical, electronic, and hydraulic components with information processing elements like microcontrollers)—first compelled the Americans and then the Europeans to accept and adopt the term mechatronics themselves (Auslander and Kempf, 1998). As previously mentioned, mechatronics is the merging of the disciplines of Mechanical Engineering, Electrical Engineering, Electronics, and Computer Science, with the goal of creating "smart" systems. At present, various definitions of mechatronics exist depending on the field of interest. According to Yaskawa Electric (1969), mechatronics refers to devices and systems that combine mechanical and electronic parts. The reputable scientific journal IEEE / ASME Transactions on Mechatronics defines mechatronics as the synergistic integration of mechanical engineering with electronics and intelligent control in the design and manufacturing of industrial products and processes. A similar definition was formulated by the Industrial R & D Advisory Committee (IRDAC) of the European Commission, according to which mechatronics refers to the synergistic combination of precision engineering with electronics and intelligent systems for the design of products and industrial processes (Billingsley, 2006).

The evolution from educational robotics to mechatronic systems has had a profound impact on education. The integration of mechatronics into educational settings encourages students to think critically and creatively. They are challenged to design solutions for complex problems, often working in teams to brainstorm and prototype ideas. This collaborative environment mirrors the modern workplace, where interdisciplinary teams tackle multifaceted challenges.

The question that remains, however, is how effective the use of educational robotics and mechatronics systems in education is. To answer this question, the concept of usability must first be defined. Usability has been a fundamental parameter in information technology and computing systems for many years. Even before it was formally established as a concept, it had already concerned experts, who used the phrase “user-friendliness” in reference to information systems (Nielsen, 1993). This phrase was later replaced by various concepts with a human-centered focus, such as HCI (Human-Computer Interaction), HMI (Human-Machine Interface), etc. (Nielsen, 1993). In 1981, Shackel was the first to use the

term "usability" for systems, thus replacing all the previous prevailing terms (Bevan, Kirakowski & Maissel, 1991). This occurred because it had become widely accepted that users do not need machines that are merely friendly to them, but rather machines that do not hinder them in accomplishing their tasks (Nielsen, 1993).

It also became necessary to consider that each user has different needs. Each user is more or less familiar with technology use. This implies the need for ease of use by all, without discrimination or exceptions.

Numerous definitions of usability have been proposed to this day. The International Organization for Standardization (ISO-9241-11) defines usability as a quality that provides effectiveness, efficiency, and satisfaction. However, it emphasizes that usability depends on specific users, with specific goals, under a specific usage context (Ergonomics of Human-System Interaction, 2008). This definition clearly highlights that usability largely depends on identifying the users, their intended goals, and the conditions or context in which the system is used.

Another definition argues that the role of system design in computing is its usability—i.e., "to function according to user expectations, satisfying their requirements" (Dix et al., 2004, p. 319). Many factors contribute to usability and determine whether something is usable or not. From a human-centered perspective, for a product or service to be considered usable, it must meet certain criteria, such as usefulness, performance, effectiveness, user satisfaction, ease of learning, and accessibility (Rubin & Chisnell, 2008). In general, "what makes something usable is the absence of frustration during its use" (Rubin & Chisnell, 2008, p. 4).

This research examines the usability of a mechatronic system in terms of usefulness, ease of use, ease of learning, and satisfaction (Lund, 2001).

STATE OF THE ART

Programming was later combined with educational robotics, in the development of which a dominant role is played by the emergence of specialized kits that combine the constructional foundation of objects (e.g., Lego-type bricks) with sensors, processing units, actuators (e.g., motors), and user-friendly (visual) software. These elements work harmoniously together to build a robotic structure. Within this context, it becomes clear that programming becomes tangible for students, as they can immediately observe the result of their programming and make corrective interventions if necessary (Tsagaris, 2023).

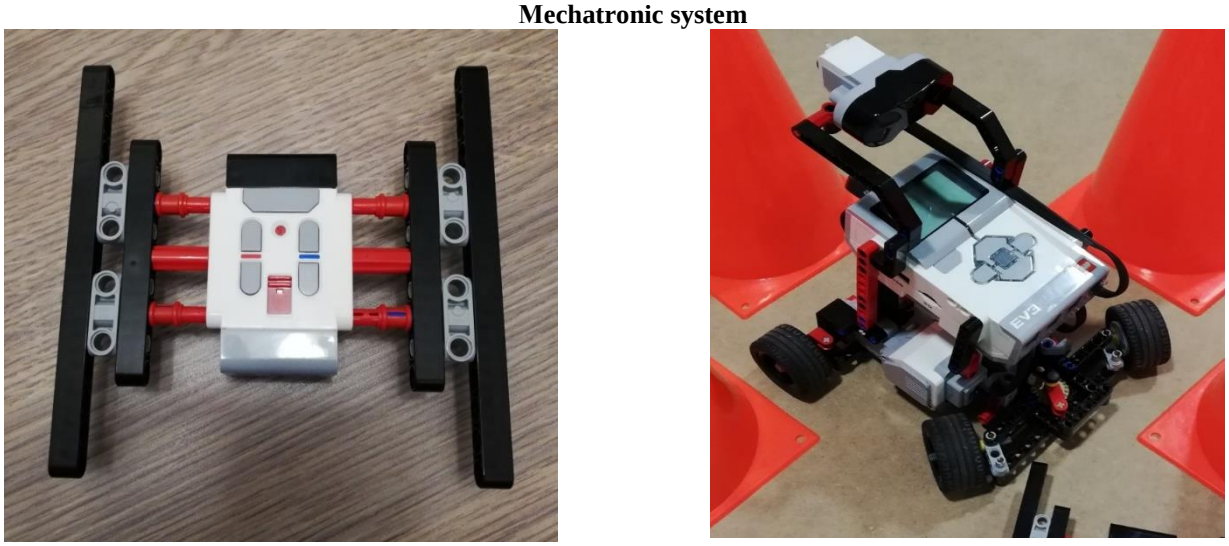
In the modern educational community, the appeal of robotics lies in the opportunity it offers learners to create an object (e.g., a wheeled vehicle) and then control it, taking into account environmental parameters, using a programming environment that is particularly intuitive and enjoyable for students. Naturally, the role of the teacher is almost irreplaceable, as they must organize and guide the entire process, having planned the lesson in advance. Unfortunately, there are often obstacles for the teacher, such as the lack of appropriate training and technical support (laboratories, computers, robotics kits, lesson plans, etc.) (Alimisis, 2009). As for students, especially beginners, what seems to intimidate and challenge them is programming, which is an integral part of robotics as a teaching subject. According to Kyriakou & Fachantidis (2012), the main reasons for these difficulties are the traditional approaches to teaching the principles of programming, as they were taught in the past.

In recent years (2016), a new educational model has been proposed by Atmatzidou & Dimitriadis (2016): the "CPGC+" model, an acronym for the words Collaboration, Problem, Game, and Competition, with the "+" symbol referring to the development of skills such as problem-solving, metacognition, computational thinking, collaboration, communication, and more, through additional supportive interventions by the teacher. This model serves as a learning tool aiming to cultivate both general and specialized skills in students, yielding optimal results through the teaching of educational robotics. Similar conclusions are drawn by Avramidou (2016), who emphasizes that educational robotics activities contribute to the development of computational thinking skills. Bakas (2011) investigated to what extent students' involvement in a robotics project could contribute to achieving part of the learning objectives of the course "Elements of Programming in a Graphical Environment" in the third grade of Greek vocational high schools (EPAL), and more broadly, to the teaching of programming in both high school and junior high school. The results were positive in terms of the effectiveness of educational robotics.

An approach that utilizes educational robotics in combination with visual programming is proposed by Kyriakou & Fachantidis (2012). In a problem-solving project inspired by play, the Lego Mindstorms for Schools robotics kit was used to teach basic programming principles—particularly selection and repetition structures. These concepts were found to be difficult for beginner students to understand during programming lessons in the third grade of junior high school. Thus, the study examined the contribution of educational robotics and visual programming to overcoming these

difficulties. It was ultimately found that Lego Mindstorms robotic constructions can substantially support programming education. By using sequential structures along with selection and repetition, students were able to implement a wide range of behaviors and scenarios, having mastered the logic behind them (Tsagaris and Chatzikyrkou, 2020).

In another case, Ranganathan et al. (2019) analyzed children's interaction through gestures, showing a high level of acceptance for this new communication method. The children were highly motivated to participate, and the ease of interaction was evaluated very positively (Pons & Jaen, 2019). The study by Nacher, Garcia-Sanjuan, and Jaen showed that young children around the age of six found it difficult to interact with mechatronic systems. In fact, most of them failed to achieve the final task. Furthermore, the time required to complete tasks was found to be strongly correlated with age: the older the children, the more successfully they met the timing goal. In the same study, regarding whether children could guide a robot through a predetermined path, statistical analysis revealed that children aged three and above could complete the tasks with nearly 100% success (Nacher et al., 2016).



Vasey et al. compared the usability of an Android-based app with a remote control for operating a mechatronic system (Aldebaran Nao robot). The results were positive, highlighting the app's ease of use and the well-organized interface (Vasey et al., 2017). Ranganathan et al. also studied children's interaction with a robotic arm, focusing on how easily children aged 9–12 could control it. The results showed a striking effect of age on motor learning: 9-year-olds struggled significantly, with only ~40% able to complete the task. Although 12-year-olds showed some improvement, they still had difficulty controlling the robotic arm, with low task completion rates, longer movement times, and longer path lengths (Ranganathan et al., 2019).

METHODOLOGY

The purpose of this study is for a sample of students to handle and evaluate the usability of the interaction between a remote control and an autonomous robotic vehicle across three scenarios of varying difficulty, each corresponding to a specific questionnaire.

Taking into account that the subject of the research is the evaluation of interaction usability with an autonomous robotic vehicle, the collection of relevant information is conducted through a standardized tool (questionnaire). Given that the data collected is quantitative, that the students can be approached through the pilot programs being implemented, that it is possible to gather data from a sufficient number of them (a sample), and that the time available for conducting the research and processing the results is relatively limited, the chosen methodology for this research is descriptive, quantitative, and sample-based. It is fundamental in nature, with a view to applying the results, and is carried out using questionnaire tools. A pilot implementation of the tool was used in all three questionnaires applied.

Figure 1
Mechatronic system

In order to timely identify any potential flaws in the wording of the questions that could lead to misinterpretation by the respondents, a pilot test of the questionnaire was conducted with five trainees. Based on their feedback, minor adjustments of limited scope and significance were made, and the average time required to complete the questionnaire

was calculated. The most significant issues arose from the fact that some questions were not clearly understood, as they included specialized terminology that was not easily comprehensible to this particular group of individuals.

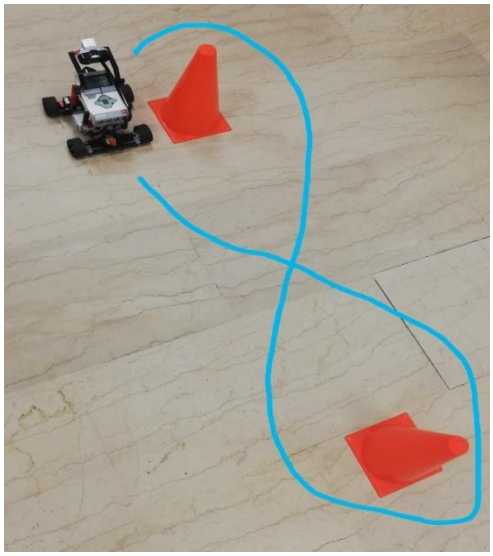
The main challenge encountered was that the researcher, who was also the trainer of the specific group, could not record all his observations at the same time due to time constraints. The sample was formed using purposive sampling. The questionnaire was completed by trainees who participated in an educational robotics program for primary school children. A total of 100 participants took part in the study, attending the training in groups of 4–6 individuals. The questionnaires were distributed and completed during the course sessions (Tsagaris & Chatzikyrkou, 2019).

For the construction of the remote control, a Lego Mindstorms EV3 Infrared Beacon from the home edition was used, along with some additional bricks to ensure more stable handling (Figure 1).

Figure 2
First scenario

The Lego Mindstorms EV3 Infrared Beacon remote control communicates with the infrared sensor of the Lego Mindstorms EV3 home edition via infrared radiation. The sensor, in turn, sends commands to one of the inputs of the microcontroller, which are then translated into motion. This is achieved through two Large motors connected to the outputs of the microcontroller, which drive the rear wheels. Additionally, a Medium motor is connected to another output and is responsible for steering the vehicle by turning the front wheels either left or right. All of this is, of course, controlled through appropriate programming stored in the microcontroller's memory, created within the Lego Mindstorms EV3 programming environment.

In the first scenario, which is the easiest, students are asked to use the robotic vehicle to navigate around a square path (Figure 2). After completing the task, they are required to complete the System Usability Scale (SUS) questionnaire, where they first fill in their age, gender, and place of residence.



The System Usability Scale (SUS) was developed in 1986 by John Brooke and consists of only 10 questions/statements, which are rated by respondents on a 5-point scale, ranging from 1 ("Strongly Disagree") to 5 ("Strongly Agree"). All questions must be answered, and if a participant is unsure, they are instructed to choose 3 (neutral response). From the scoring of the statements, a final usability score is calculated.

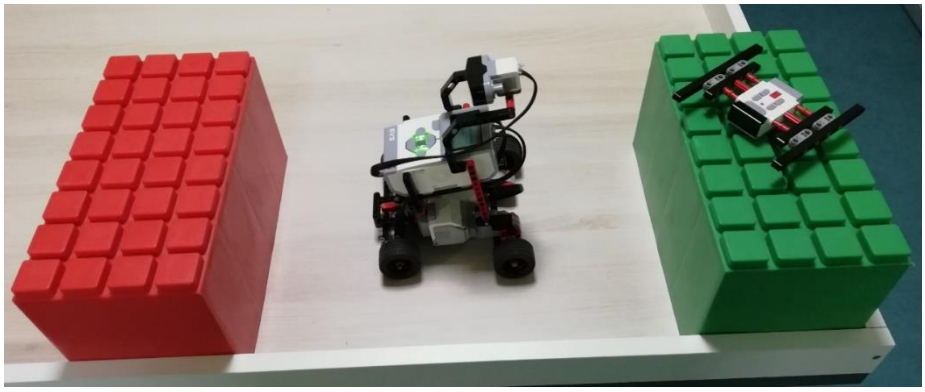
The SUS questionnaire has several features that make it stand out. Perhaps its most important characteristic is that it can be used to evaluate the usability of any system, software, or service, making it technology-agnostic. In addition, it can be easily and quickly completed by respondents, and just as easily and quickly analyzed by researchers who use it. The single final score it provides can be understood even by individuals who are not specialists or experts in the field of usability evaluation.

In the second scenario, which is more difficult than the first, students are asked to use the robotic vehicle to perform a figure-eight maneuver between two cones, following the path marked in blue in the image below (Figure 3).

After completing the task, students are asked to fill out the USE questionnaire, where they first provide their age, gender, and place of residence. The structured USE questionnaire (Usefulness, Satisfaction, Ease of Use), proposed by Lund (2001), is a tool designed to categorize user responses across the dimensions of usefulness, ease of use, satisfaction, and ease of learning.

Figure 3
Second scenario

It includes 30 questions using a seven-point Likert scale, where users can select from the following levels of agreement:



- "Strongly Disagree"
- "Disagree Somewhat"
- "Neutral"
- "Agree "
- "Strongly Agree"

These levels are mapped to numerical values from 1 to 5, where "1" corresponds to "Strongly Disagree" and "5" to "Strongly Agree", allowing for the quantification of the response variable. The 30 questions are grouped into the following four categories:

(A) Usefulness
(B) Ease of Use
(C) Ease of Learning
(D) Satisfaction

The usability of the interface is assessed based on these four categories by calculating the average of users' responses for each group of related questions.

Figure 4
Third scenario

In the third scenario, which is the most difficult, students are asked to park the robotic vehicle between two objects, as shown in the image below (Figure 4).

After completing the fields for gender, age, educational level, and place of residence, participants are asked to answer the questions in the third questionnaire, called Tsagaris, which is a tested and standardized questionnaire consisting of twenty questions using a five-point Likert scale. In these questions, users can select one of the following levels of agreement, corresponding to the scale used in the USE questionnaire. The third questionnaire is used to assess effectiveness, efficiency, satisfaction, and ease of use. Each of these four sections consists of five questions

RESULTS

Following the completion of the study on usability evaluation of interaction with an autonomous robotic vehicle, and based on the responses of the sample of 100 children aged 5–12 years (5–6: 48%, 7–8: 26%, 9–10: 16%, 11–12: 10%), of whom 84% were boys and 16% girls, and 48% lived in western Thessaloniki while 52% lived outside Thessaloniki, several useful conclusions can be drawn regarding the usability of the widely used educational robotic system Lego Mindstorms EV3 Infrared Beacon, included in the Lego Mindstorms EV3 home edition package.

From the results of the first questionnaire (SUS), we conclude that the Lego Mindstorms EV3 Infrared Beacon:

- Encourages repeated use (94% AGREE),
- Is not complex (80% AGREE),
- Instills a sense of confidence during use (98% AGREE),
- Is easy to learn (70% AGREE),

and that younger children aged 5–6 require technical assistance to use it, in contrast to children aged 11–12.

According to the results of the second questionnaire (USE):

- In the first section (Usefulness):
  - 92% agree that it helps them be more effective,
  - 98% agree it is useful,
  - 98% agree it does everything they expected it to do.
- In the second section (Ease of Use):
  - 92% say it is easy to use,
  - 94% agree it is user-friendly,
  - 96% state that it is flexible and can recover from errors quickly and easily.
- In the third section (Ease of Learning):
  - 90% remember easily how to use it,
  - 80% state it is easy to learn and use.
- In the fourth and final section (Satisfaction):
  - 100% say they are satisfied with the interface,
  - 96% would recommend it to a friend,
  - 98% consider it excellent.

In the third questionnaire (Tsagaris), in the first five questions, which assess Effectiveness, 96% disagreed that errors occur during interaction, while 100% agreed that the interface functions as expected. In the second section, which concerns Efficiency, 100% agreed that interaction is easy and 92% agreed that the user has freedom of movement.

Satisfaction is evaluated in the third section of the questionnaire, with 100% agreeing that operating the system is not tiring and that commands can be easily changed. In the fourth section, which assesses Ease of Use, 96% stated that the system is flexible in selecting movements, and 100% agreed that the commands are easy to remember and that the training is easy.

CONCLUSION

This study highlighted the high usability and educational value of the Lego Mindstorms EV3 Infrared Beacon system as a means of interaction with an autonomous robotic vehicle for students aged 5–12 years. From the analysis of data collected through the three questionnaires (SUS, USE, and Tsagaris), the following key conclusions emerged:

- The system encourages frequent use and is characterized by user-friendliness, without requiring a high level of prior knowledge. This makes it suitable even for younger children, with only minimal need for technical support.
- In terms of usefulness and effectiveness, participants felt that the robotic vehicle fully met their expectations and facilitated the achievement of assigned tasks.

- Ease of use and learning indicators showed high values, with children quickly learning how to operate the system and easily recognizing the commands required for its control.
- User satisfaction with the system was universal, with the majority of children stating that they would recommend it to a friend and describing the experience as both positive and enjoyable.
- The Tsagaris questionnaire further confirmed the system's reliability and functional stability, indicating that the interface operates without errors, offers freedom of movement, and that training for its use is simple and understandable.

In summary, the Lego Mindstorms EV3 Infrared Beacon proves to be a fully functional, flexible, and pedagogically effective educational robotics tool that combines technical quality, usability, and a positive learning experience. Its use in educational settings appears to enhance students' creativity, autonomy, and problem-solving skills.

INTEGRATING ALGORITHMIC THINKING AND PROGRAMMING INTO SECONDARY EDUCATION THROUGH EDUCATIONAL ROBOTICS: A CASE STUDY BASED ON THE NEW GREEK CURRICULUM OF IEP

Angelos Rondogiannis
Computer Science & Music Educator (PE86 – TE16)
Department of Computer Science Education,
2nd Experimental General Lyceum of Lefkada, Greece
email: arondo@sch.gr

ABSTRACT

This article presents a case study exploring the integration of algorithmic thinking and programming in upper secondary education through educational robotics. The intervention is grounded in the new national Informatics curriculum developed by the Greek Institute of Educational Policy (IEP), focusing on the thematic area "Algorithmic Thinking – Programming of Computing Systems" and specifically the sub-topic "Programming of Robots and Hardware."

Through a scenario based on the use of Arduino microcontrollers and simulation platforms such as Tinkercad, students were guided in constructing and programming automated systems. The approach blends simulation with physical computing, fostering students' engagement with real-world technological applications. Emphasis was placed on constructivist and experiential learning, collaborative project work, and the cultivation of core digital skills.

The study was implemented during the 2023–2024 academic year with 11th-grade students, highlighting increased engagement, improved programming literacy, and enhanced problem-solving and collaborative abilities. Findings suggest that educational robotics serves as a powerful medium for delivering key computing concepts while promoting creative and critical thinking.

INTRODUCTION

The accelerating pace of technological development necessitates a paradigm shift in computer science education. Beyond acquiring operational familiarity with digital tools, students must be equipped with algorithmic thinking and problem-solving abilities that transcend disciplines. Educational robotics, as a pedagogical tool, offers a unique opportunity to connect theoretical knowledge with authentic practices.

This study presents a teaching scenario aligned with the new curriculum introduced by the IEP for the subject "Introduction to Computer Science" in the 11th grade. The focus is on applying algorithmic and programming knowledge to the construction and control of physical computing systems using microcontrollers (Arduino) and sensors, both virtually (via Tinkercad) and in real-world contexts.

Through collaborative project work, students design and implement automation systems, simulating smart environments. The process involves interpreting programming logic, assembling circuits, and iteratively debugging and optimizing their artifacts. The scenario also aligns with the broader pedagogical goals of the IEP: the cultivation of creativity, innovation, and digital competency in line with 21st-century educational frameworks.

THEORETICAL FRAMEWORK

Algorithmic Thinking and Programming

Algorithmic thinking refers to the structured formulation of step-by-step procedures to solve problems efficiently. Programming, as the expressive language of algorithms, enables the practical implementation of such procedures through code. The IEP curriculum prioritizes the development of algorithmic literacy as a core competency in digital education.

Epistemological Foundations

The scenario is grounded in constructivist and socio-constructivist learning theories, advocating for active student participation and discovery-based learning. Students are encouraged to explore, experiment, and reflect upon their actions, thereby internalizing computational concepts through hands-on activities.

Prior exposure to block-based (e.g., Tinkercad) and visual programming (e.g., App Inventor) environments serves as a scaffold for transitioning to text-based programming via the Arduino IDE. The pedagogical approach adopts a "black-box" exploration model, where students initially analyze system outputs without direct code access and subsequently investigate the corresponding code structure.

Methodological Approach

The instructional design emphasizes collaborative learning and active engagement. Students work in teams, dividing responsibilities between programming and hardware assembly. This structure encourages mutual support, peer instruction, and role rotation, fostering autonomy and collective accountability.

Curriculum Alignment

The scenario is consistent with the Cross-Thematic Curriculum Framework (DEPPS) for Informatics and the revised IEP guidelines for upper secondary education. It supports competencies outlined in national and European digital literacy frameworks, such as critical thinking, computational problem-solving, and collaborative learning.

Integration of ICT

The scenario utilizes digital tools such as the Arduino IDE and Tinkercad's simulation platform to facilitate a hybrid learning environment. The integration of ICT serves not merely as a medium of instruction but as an epistemological tool for constructing knowledge and enhancing technological fluency.

Proposed Teaching Scenario – Feasibility and Design

The scenario is intended for the computer lab using suitable educational software and hardware. A projector is used for introductory demos. Students work in teams of four, in sub-groups of two, each with a computer (with Tinkercad

and Arduino IDE), worksheets, and robotics materials. They communicate, interact, and take predefined roles (programming, worksheet handling), collaboratively solving progressively harder tasks.

An introductory psychological and cognitive warm-up is implemented to prepare students mentally and emotionally. No significant issues are expected regarding lab equipment or software. Worksheets are structured to be accessible and engaging.

SCENARIO DESIGN

Title

"Design and Programming of an Automated System Using the Tinkercad Simulator and Arduino Hardware"

Duration

Two teaching sessions (45–50 minutes each), supplemented by preparatory student engagement and optional extension activities.

Target Group

11th-grade students enrolled in the course "Introduction to the Principles of Computer Science."

Learning Objectives

Cognitive Objectives

- Identify the structure and functions of the Arduino microcontroller
- Understand the use of control structures (if/else, loops) and logical conditions
- Distinguish between simulation and physical implementation
- Apply algorithmic reasoning in the development of automation systems

Technical Objectives

- Utilize Tinkercad for virtual circuit design and block-based programming
- Transition from block-based to text-based programming using the Arduino IDE
- Assemble circuits using breadboards, resistors, LEDs, buzzers, and sensors
- Troubleshoot hardware and software errors effectively

Socio-affective Objectives

- Develop teamwork and communication skills
- Engage in reflective and iterative learning practices
- Cultivate creativity and technological confidence

IMPLEMENTATION AND INFRASTRUCTURE

Instructional Environment

Students work in teams of four, divided into subgroups (programming/simulation and physical assembly). Each group utilizes a computer with internet access, Tinkercad, and the Arduino IDE installed. A projector is used for whole-class demonstrations.

Lesson 1: Introduction to automation systems and circuit simulation using Tinkercad. Students begin building their projects.

Lesson 2: Transition from simulation to real hardware implementation. Students complete and refine their artifacts, reflecting on encountered challenges.

Resources and Equipment

- Arduino Uno boards
- Breadboards, jumper wires, LEDs, resistors, piezo buzzers, PIR sensors
- Computers with Tinkercad and Arduino IDE
- Instructional worksheets and teacher support materials

Proposed Activities

- Students are given robotics and automation programming projects to build and implement.

EVALUATION, CONCLUSIONS, AND CHALLENGES

Outcomes

The implementation demonstrated that students acquired a deeper understanding of programming logic and algorithmic structures. Their engagement levels and motivation increased significantly due to the tangible and interactive nature of the activity. Group collaboration fostered peer learning, and the iterative development cycle promoted a scientific approach to problem-solving.

Conclusions

Educational robotics represents a powerful pedagogical strategy for integrating STEAM principles and fostering transversal competencies. By bridging theoretical learning with physical interaction, it aligns with constructivist models and supports lifelong learning habits. Students emerge not only as consumers but as creators of technology, capable of addressing complex challenges through innovation.

Recommendations

Future implementations should consider expanding access to robotics kits, offering teacher training in physical computing, and incorporating robotics into broader cross-curricular projects. Institutional support and infrastructure investment remain critical for sustained success.

This case study affirms the pedagogical value of educational robotics as a vehicle for teaching programming and algorithmic thinking in secondary education.

Future implementations should:

- Extend project duration to allow deeper exploration and creativity
- Include interdisciplinary connections (e.g., environmental science, smart cities)
- Provide continuous professional development for educators in physical computing

Institutional support, resource allocation, and curriculum flexibility are essential for scaling such initiatives.

CROCUS CULTIVATION ALGORITHM – EXPLORING NATURE'S STEPS THROUGH PROGRAMMING

Antigoni Tsirou
Computer Science Teacher, MSc
Directorate of Primary Education of Kozani, Hellenic Ministry of Education and Religious Affairs
Kozani, Greece
e-mail: tsirouant@gmail.com

ABSTRACT

The project titled "Crocus Cultivation Algorithm – Exploring Nature's Steps through Programming" presents an innovative teaching approach for primary school students that combines programming with the exploration of natural phenomena. The core focus is the development of algorithmic thinking through experiential, visual, and tactile learning, using a digital layout that depicts the stages of saffron (Crocus Kozanis) cultivation.

Drawing on her experience in computer science, the educator designed and printed a visual layout illustrating each cultivation stage of the crocus plant. When placed on a classroom table, students are prompted to identify the specific stage indicated by the teacher and construct the corresponding algorithm. Before programming the Bee-Bot robot, the teacher introduces command cards (created by herself) that represent movements such as "forward," "backward," "right," "left," "pause," "start," and "reset." These cards are arranged sequentially next to the layout, offering a visual representation of the steps required for cultivation.

The methodology is implemented through hands-on activities that actively engage students in designing and executing the algorithm with the robot. Beyond enhancing technical skills, the activity fosters critical thinking and collaboration. The key findings indicate that linking theoretical knowledge with practical application through experiential learning improves students' understanding of algorithmic concepts and promotes teamwork.

Moreover, results show that the use of visual and tactile tools contributes to creating an engaging learning environment where students develop problem-solving skills and gain confidence in applying technological solutions. This approach enables learners to connect natural processes with programming, highlighting the importance of sequence and structure in a multidimensional learning context. Additional observations confirm the method's positive impact on creativity and educational outcomes.

Keywords: algorithmic thinking, programming, experiential learning, visual learning, tactile learning, collaboration, crocus cultivation.

INTRODUCTION

Teaching programming and computational thinking in Primary Education is a challenge, as it requires approaches tailored to the developmental stage and needs of young students. Experiential and visual learning provide fertile ground for cultivating algorithmic thinking in ways that are understandable and engaging for children.

This teaching proposal uses the theme of Crocus cultivation in Kozani—a plant with strong local, cultural, and economic significance—as a starting point for introducing students to the basic principles of programming. Through the use of an educational robotic tool (Bee-Bot) and a specially designed mat, students are invited to recognize stages of natural processes and transform them into sequences of commands.

Introducing nature into programming, by connecting cultivation stages with the concept of the algorithm, offers a multisensory learning environment that promotes creativity, collaboration, and active participation.

Algorithmic Thinking through Nature: An Experiential Approach with Crocus Kozanis and Bee-Bot.

This work leverages the local natural and cultural wealth of the Kozani region, focusing on Crocus cultivation, as a starting point for developing algorithmic thinking skills in Primary Education students. The connection of nature with programming is achieved through experiential learning and the use of educational robotics, making the learning process more attractive and comprehensible.

This innovative approach includes the use of a mat, designed and printed by the teacher, depicting the sequential stages of Crocus cultivation. Students, in groups, identify the indicated stage each time and create movement algorithms for the Bee-Bot robot, using command cards symbolizing directions and actions. This process encourages them to develop skills of analysis, sequencing, prediction, and problem-solving.

Children's participation is active and collaborative, with an emphasis on understanding the concept of the algorithm and cultivating social skills. The approach has proven particularly effective in enhancing creativity, self-confidence, and the connection between theory and practice. Furthermore, it promotes the connection of school with local culture, enhancing the educational value of designing and utilizing local themes in the ICT curriculum.

TEACHING SCENARIO

Title of the teaching scenario: "Crocus Cultivation Algorithm – Exploring Nature's Steps through Programming."

Estimated duration of the teaching scenario: 2 hours, aimed at lower grade primary school students.

TEACHING OBJECTIVES

Algorithmic Thinking & Sequence of Commands: Students will develop the ability to think sequentially and compose simple algorithms (commands such as "forward," "backward," "right," "left," "pause," "start," "clear memory").

Visual and Tactile Learning: Through the mat depicting the stages of Crocus growth, students will enhance their ability to connect images with processes and actions.

Connecting Nature and Technology: The activity aims to show how technology (robot programming) can be used to understand and represent natural phenomena, such as plant cultivation.

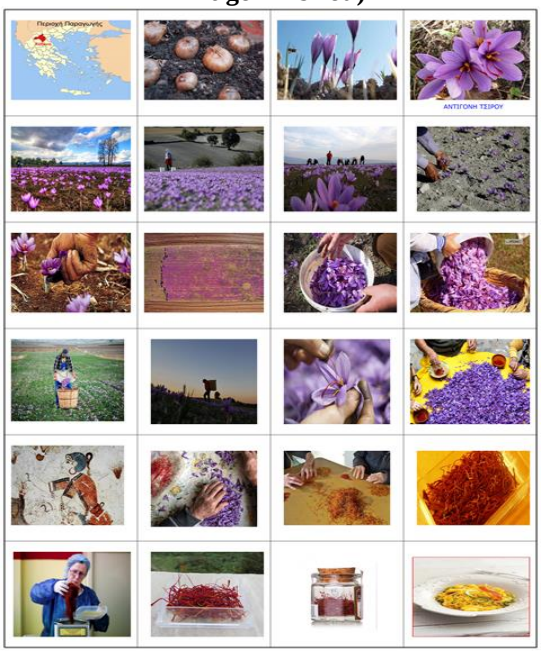
Collaboration and Team Spirit: Group activities encourage collaboration, dialogue, and collective reflection.

Experiential and Interactive Learning: Through play and the practical application of commands, students will experience the process of trial, error, and correction, essential for problem-solving.

TEACHING MATERIALS

Crocus Mat: Images depicting the stages of growth of the Crocus (Kozani saffron) plant.
Command Cards: Cards showing commands (forward, backward, right, left, pause, start, clear memory).
Bee-Bot Robot: Programmable robot for executing commands.
Flower Cubes: Small objects placed on the mat to be collected by the robot.

Cart: A special surface to place the cubes once they are collected.



Picture Dice: Dice containing images from the mat, with one image (a mole eating the bulb) having a special meaning in the game (loss of turn).

STRUCTURE OF THE ACTIVITY

INTRODUCTION TO THE SCENARIO

The introduction takes place through the myth and history of the crocus, connecting the teaching of programming with the use of the Bee-Bot educational robot and a specially designed mat. The teacher narrates to the children the myth of the crocus: according to the myth, Crocus was a young man who was accidentally killed by the god Hermes during a game. Out of his grief, Hermes transformed him into a crocus flower, and the three drops of blood from his head became the red stigmas of the flower, the well-known saffron, which has been cultivated in Kozani since antiquity. The teacher then explains the stages of the plant's growth, highlighting the importance of proper cultivation and connecting the activity to real life and nature. At the same time, the concept of the algorithm is introduced, showing how each command or step leads to a specific result, just as in nature each stage leads to the development of the plant, creating a meaningful connection with programming**.**

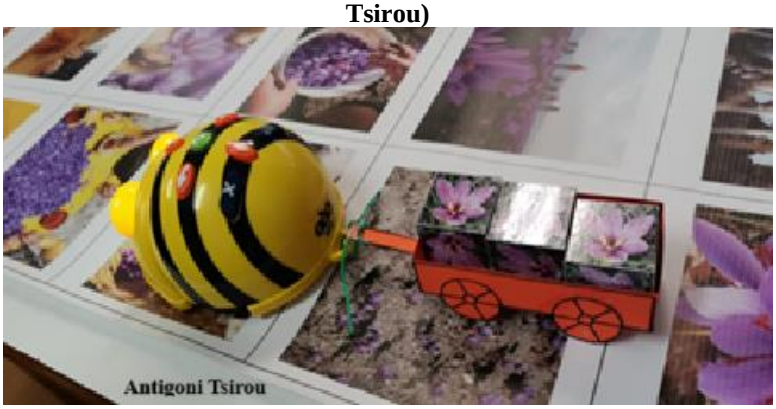
Picture 1
Mat with various images depicting the stages of the Crocus Kozanis plant. (The material was designed by Antigoni Tsirou)

DESCRIPTION OF ACTIVITIES

In the first activity, the Bee-Bot robot is introduced, focusing on the direction buttons. This is followed by group work, where each group is asked to operate the robot, experiment with the direction buttons, and explore its basic capabilities through hands-on interaction.

The second activity, "The Bee-Bot Robot Algorithm," involves preparing the algorithm: the teacher places the command cards in the correct sequence on the table next to the mat, according to the selected stage of the Crocus, so that the Bee-Bot robot is programmed to reach that point.

Group Participation: Students propose, discuss, and confirm the sequence of commands. The teacher reinforces the logical order and the reasoning behind each step.



The third activity, Application with the Robot: The Bee-Bot robot executes the commands to collect the cubes placed on "various images" on the mat and transport them to the cart. We discuss the results and correct any errors in the sequence of commands.

Picture 2
Mat used depicting the stages of the Crocus Kozanis (saffron) plant, the Bee-Bot robot, and programming cards. (The material was created by Antigoni Tsirou)

The third activity, Application with the Robot: The Bee-Bot robot executes the commands to collect the cubes placed on "various images" on the mat and transport them to the cart. We discuss the results and correct any errors in the sequence of commands.

Picture 3.
The Bee-Bot robot on the mat transporting the crocus (flower cubes) to the cart. (Material created by Antigoni Tsirou)

The fourth activity, "The Dice Game." Grouping and Explaining Rules: Students are divided into groups. Each group rolls the special dice created with images from the mat. Important: If a die shows the image of the mole (eating the crocus plant bulb), the group loses its turn, even at the start of the game.

Through the game, students are encouraged to think quickly, take initiative, and collaborate to find the best strategy to progress in the "algorithm" of cultivation. This is followed by a concluding discussion and reflection, during which students reflect on the steps taken, what worked well, and what could be improved. At the same time, connections are made to everyday life, discussing how the sequences and commands used mirror processes in nature and how programming can be applied in many areas of life. The importance of collaboration and collective thinking in achieving a common goal is emphasized. In closing, the teacher summarizes the lessons learned from the activities, focusing on the value of algorithmic thinking and the connection between technology and nature, while giving students the opportunity to ask questions and share their impressions.

ADDITIONAL REMARKS

The activity aims to help students experience the process of programming by seeing the immediate impact of

their commands on a physical model (experiential learning). At the same time, the use of the mat with images and objects, as well as the dice and command cards, facilitates understanding through vision and touch (visual and tactile teaching). Additionally, the teacher has the ability to adapt the commands and level of difficulty according to the needs and abilities of the students, enhancing their autonomy and creativity (flexibility and differentiation).

Picture 4.
Mat used in the activity depicting the Crocus Kozanis (saffron) plant with the Bee-Bot robot and the special dice. (Material created by Antigoni Tsirou)

CONCLUSIONS

The implementation of this teaching proposal highlighted the potential of connecting local cultural themes with the teaching of programming in Primary Education. Integrating the cultivation of Crocus Kozanis as a thematic framework increased student interest and participation, while also making the concept of algorithmic thinking more comprehensible.

The use of the Bee-Bot robot and the mat proved effective in developing skills of visualization, sequencing commands, and problem-solving, while also providing a collaborative and creative environment. Students are actively involved in the learning process, take on roles, and act responsibly, demonstrating increased confidence in executing algorithms.

This approach demonstrates that educational robotics, when meaningfully integrated into the curriculum and connected to students' real-world contexts, can transform the teaching of Informatics. Finally, it underscores the value of experiential learning and the use of local themes as drivers of educational innovation.

ABSTRACT

Pragmatic skills are fundamental for children's social interaction and academic success. Traditional screening methods can be unengaging for young learners, prompting interest in digital, game-based alternatives. This study explores the feasibility of the digital activities, combining gamification and digital storytelling, as a screening tool for pragmatic deficits in primary school children.

We designed and developed the interactive digital activities using PowerPoint, integrating narrative elements and game mechanics to assess various aspects of pragmatic competence. Six children aged 8–12 years participated, each with parental written consent. Individual sessions were conducted in supportive environments, and usability, engagement, and overall experience were evaluated through structured interviews.

Children responded positively to the digital activities, reporting high levels of interest and engagement. Most found the interface intuitive and the activities enjoyable, especially the interactive dialogue component. Minor technical or usability issues were noted by a few participants, but did not detract significantly from the experience.

Initial findings of this study suggest that a digital activities format may offer a child-friendly, engaging approach for preliminary screening of pragmatic skills. As this was a feasibility study with a small, non-clinical sample, further research with larger and more diverse groups is required to validate the tool's effectiveness and expand its application in educational and clinical settings.

Keywords: Pragmatics, interactive screening, feasibility study, gamification, digital storytelling, children

INTRODUCTION

In recent decades, the rapid advancement of technology has transformed educational environments and opened new possibilities for addressing persistent challenges in learning and assessment (Ancona et al., 2024; Bernardini et al., 2014; Gong et al., 2019; Hookham et al., 2019; Kinross, 2018; Min et al., 2022; Mojtahedzadeh et al., 2021; Xu et al., 2023). Among these challenges is the early detection of pragmatic language deficits in children, which remains a complex and often overlooked area in both clinical and school settings (Mood et al., 2020; Toki et al., 2018; Wong et al., 2022). Pragmatic skills—the ability to use language appropriately in social and communicative contexts—are fundamental for children's interpersonal relationships, social integration, and academic progress (Alduais et al., 2022; Hwa-Froelich et al., 2019; Szarkowski et al., 2020; Wong et al., 2022). Deficits in this domain can have profound consequences, including social isolation, reduced self-esteem, and long-term educational difficulties (Mood et al., 2020; Murphy et al., 2014; Rodas et al., 2017).

Traditional assessment methods for pragmatic skills, such as structured interviews and observational checklists, are well established but often limited in their ability to engage young children or reflect real-life social interactions (Toki et al., 2018; Mood et al., 2020). Recognizing these limitations, researchers and clinicians have increasingly turned to innovative approaches that leverage digital technology and interactive design. Serious games—digital games designed for purposes beyond entertainment—have been shown to increase engagement, motivation, and learning outcomes in various educational and health domains (Ancona et al., 2024; Bernardini et al., 2014; Min et al., 2022; Silva, 2019; Tung et al., 2024; Xu et al., 2023). Gamification, the application of game-like elements such as levels, rewards, and interactive challenges, has been widely used to foster participation and enjoyment in learning tasks (Khan, 2025; Toki et al., 2018; Tung et al., 2024; Xu et al., 2023). Meanwhile, digital storytelling incorporates sound, images, animations, and narrative structure to create rich, multimodal experiences that can support both assessment and skill development (Khan, 2025; Mills et al., 2022; Mojtahedzadeh et al., 2021; Moreau et al., 2018; Xu et al., 2023).

The convergence of these approaches presents a unique opportunity to reimagine how pragmatic skills are screened and supported in children. Gamification and digital storytelling not only capture children's attention but also simulate realistic social situations, making the assessment process more natural and less intimidating. Recent systematic reviews have documented the effectiveness of gamified interventions in fostering social communication and pragmatic abilities, especially among children with neurodevelopmental disorders such as autism (Ancona et al., 2024; Bernardini et al., 2014). At the same time, research into digital storytelling has highlighted its value for engagement and learning across diverse populations (Mills et al., 2022; Moreau et al., 2018; Mojtahedzadeh et al., 2021). Despite these advances, the integration of gamification and digital storytelling into pragmatic assessment is still in its early stages, and evidence regarding its feasibility and acceptability in routine practice remains limited.

In response to this gap, we set out to design, develop and test a set of digital gamified activities for the initial screening of pragmatic language skills in primary school children. We were motivated by the desire to create an assessment experience that is both enjoyable for children and informative for educators and clinicians. This feasibility study represents our first step in this process, focusing on the development and initial evaluation of digital activities that incorporates both gamification and digital storytelling elements. By inviting a small group of children to participate, we aimed to explore how they interact within the activities, what aspects they find engaging or challenging, and whether the approach is practical for real-world settings.

Specifically, our study builds upon previous work demonstrating the positive effects of interactive, gamified methods in educational and therapeutic contexts (Toki et al., 2018; Silva, 2019; Tung et al., 2024; Xu et al., 2023), while also responding to calls for more user-centered and contextually relevant assessment practices (Mood et al., 2020; Szarkowski et al., 2020). The digital activities we developed offers three distinct sections, each targeting a different facet of pragmatic competence: understanding emotions, narrative sequencing, and conversational skills. These activities draw on both evidence-based principles and teachers' feedback with the ultimate aim of creating a tool that is accessible, motivating, and relevant for primary school children.

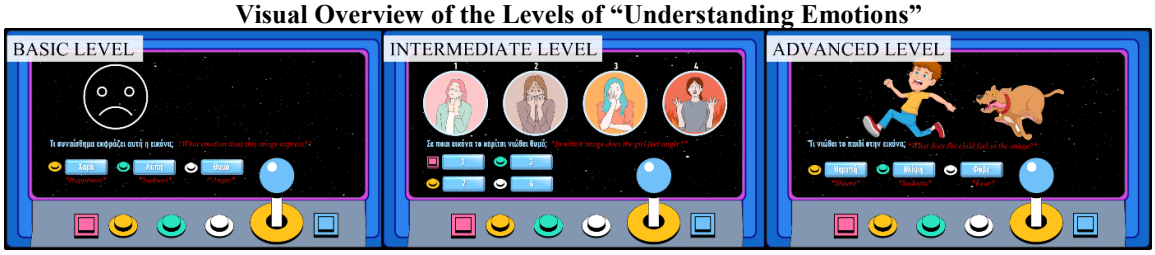
This feasibility study does not seek to validate the diagnostic effectiveness of the tool or to generalize findings to broader populations. Instead, our primary objective is to assess the usability, acceptability, and procedural practicality of the digital activities when used with a small, non-clinical sample. We view this as a necessary precursor to future, larger-scale validation studies that will more rigorously examine such tools' accuracy and educational impact. Through this initial research, we hope to contribute to the growing literature on digital assessment tools and to lay the groundwork for more inclusive, engaging, and effective approaches to pragmatic screening in children.

METHODOLOGY

This feasibility study was designed to explore the practical aspects of implementing a digital, game-based tool for the preliminary screening of pragmatic skills in children. Our methodological approach prioritized both the development process and the user experience, reflecting our commitment to participant-centered research and ethical practice.

Digital Activities Design and Development

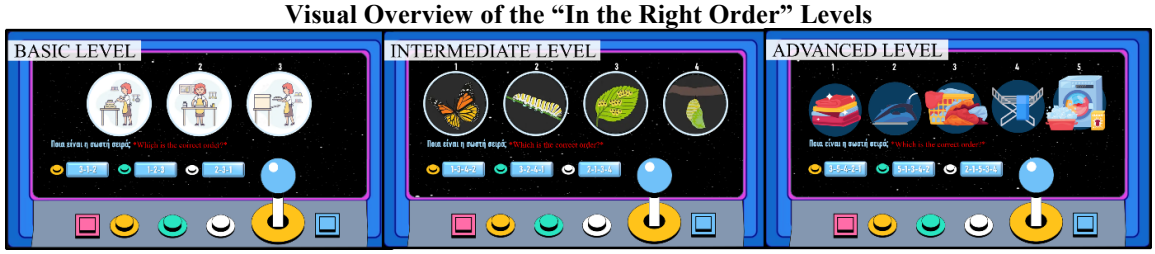
The digital activities were designed for screening pragmatic skills in elementary school children. We developed the activities using Microsoft PowerPoint, a software chosen for its accessibility and flexibility in supporting multimodal interactive experiences for non-experienced programmers. In alignment with the linguistic and cultural background of our intended users, the activities were created in Greek. The design process was guided by two foundational pillars, gamification and digital storytelling.



Digital storytelling was operationalized through the integration of multimedia elements such as voiceovers, high-quality images, animations, and concise narrative texts, all crafted to form a cohesive and engaging narrative journey for the user (Khan, 2025; Mills et al., 2022; Mojtahedzadeh et al., 2021; Moreau et al., 2018; Xu et al., 2023). Gamification mechanisms were incorporated throughout the activities, including escalating difficulty levels, a reward system featuring positive feedback and virtual awards, and a series of interactive challenges, all designed to heighten engagement and motivation (Khan, 2025; Toki et al., 2018; Tung et al., 2024; Xu et al., 2023).

The overall design embraced an arcade-inspired aesthetic, aiming to create a dynamic, immersive, and age-appropriate environment for children.

The resulting set of digital activities consist of three main sections, each targeting a distinct dimension of pragmatic competence as follows.



1. *Understanding Emotions:* This module assesses children's ability to recognize and interpret emotions through progressively challenging tasks, starting from individual facial expressions and advancing to complex scenes involving human-animal interactions (Image 1).

Image 1
Visual Overview of the Levels of "Understanding Emotions"

2. *In the Right Order:* This section evaluates narrative sequencing skills by asking children to organize images into logical and chronological order, thereby supporting their grasp of temporal and causal relationships (Image 2).

Image 2
Visual Overview of the "In the Right Order" Levels

3. *A Walk with Mumu***:** This final section simulates real-life social scenarios through interactive dialogue with a character, "Mumu." Here, children are presented with binary response options that gauge their application of politeness rules, their ability to sustain a coherent dialogue, and their adaptability across varied social contexts (Image 3).

Image 3.
Visual Overview of the Social Scenarios in "A Walk with Mumu"

Participants and Procedure

For this initial feasibility phase, we sought to engage a small group of primary school children. Our final sample comprised six children, aged 8 to 12 years, drawn from various grades of the Greek primary school system. Participation was entirely voluntary, contingent on the provision of written parental consent, and all children were adequately informed about the study's purpose, their right to withdraw, and the confidentiality of their responses.

Each child participated in an individual session conducted in a quiet, supportive environment, tailored to minimize distractions and accommodate individual needs. We aided only as needed to ensure understanding of gamified instructions, while striving to preserve the authenticity of the children's independent engagement with the tool.

Ethical Considerations

Ethical integrity was a cornerstone of our study design. All procedures adhered to the ethical standards of the University of Ioannina and followed best practices for research involving minors. The voluntary nature of participation, the right to withdraw at any time, and the assurance of confidentiality were emphasized throughout.

This study was conducted in accordance with the Declaration of Helsinki and approved by the Research Ethics Committee of the University of Ioannina (protocol code 25972/2025).

Evaluation of the Procedure

Immediately following gameplay, we conducted a structured interview with each participant. These interviews sought to elicit the children's perspectives on the digital activities' usability, clarity, and their level of engagement. By focusing on the lived experience of participants, we aimed to capture feedback that would inform future refinements of both the activities and the assessment protocol.

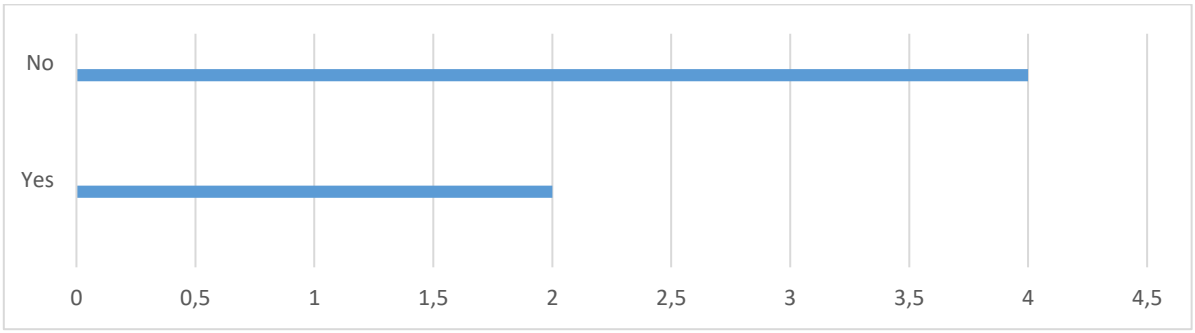
RESULTS

The findings of this feasibility study provide initial insights into the acceptability and practicality of the set of digital activities as a preliminary tool for screening pragmatic skills among primary school children.

Demographic Characteristics

Table 1
Study's Population by Elementary Class

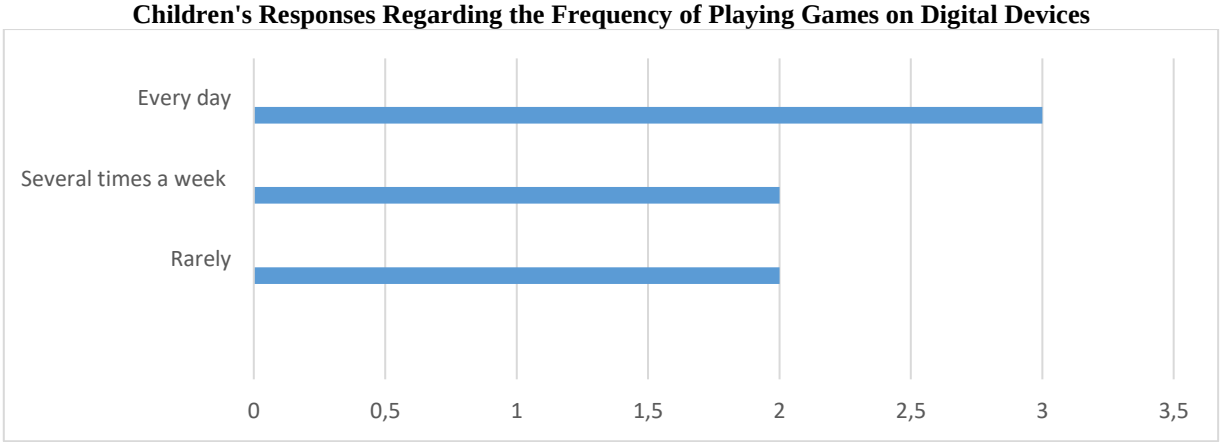
Elementary School Class	Number of Children
2nd Grade	1
4th Grade	2
5th Grade	1
6th Grade	2



The six participants in the study ranged in age from 8 to 12 years, representing a cross-section of primary school

children in classes according to the Greek educational system. Gender distribution was balanced, with equal numbers of boys and girls. This small but diverse sample provided a preliminary opportunity to observe the activities' responses across different ages and backgrounds as described in Table 1. Study's Population by Elementary Class.

Previous Experience with Digital Games



Most participants reported limited prior exposure to similar digital activities, though their engagement with digital games in general varied from frequent to occasional. This diversity in background is noteworthy, as it suggests the tool's accessibility to children regardless of their familiarity with digital platforms as illustrated in Image 4. Children's Responses Regarding Prior Use of Similar Digital Activities.

Image 4
Children's Responses Regarding Prior Use of Similar Digital Activities

In terms of the frequency with which children played digital games in their everyday lives (Image 5), responses were distributed as follows: two children (33%) stated that they played rarely, three children (50%) played several times per week, and one child (17%) played daily.

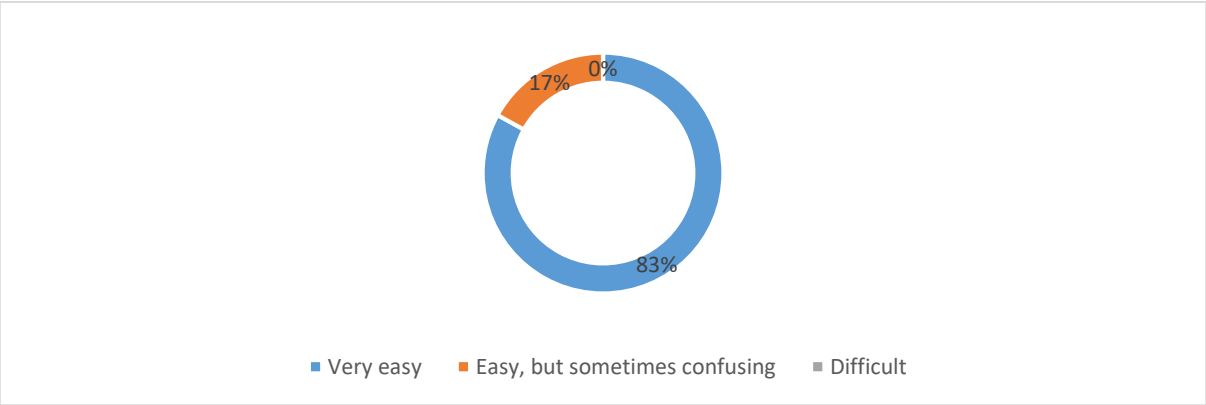


Image 5
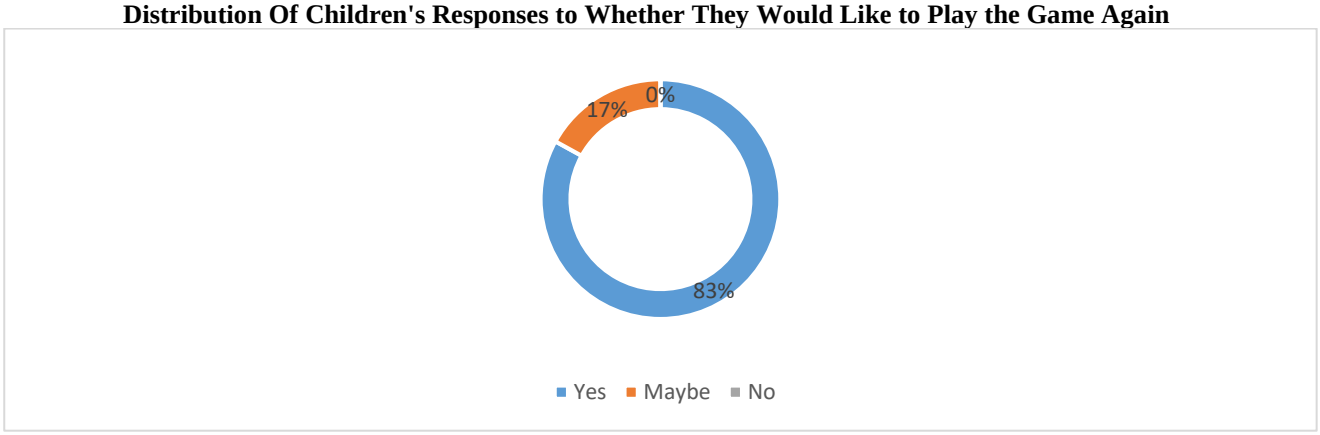
Children's Responses Regarding the Frequency of Playing Games on Digital Devices

Digital Activities Usability and Engagement

Feedback from the structured interviews indicated that most children found the digital activities easy to use, with minor variations in perceived usability. Precisely, five out of six children (83%) found the game either "very easy" or "easy but sometimes confusing," while one child (17%) described it as "difficult" (see Image 6).

Image 6
Children's Responses on the Game Perceived Ease of Use



Notably, all children described the activities as interesting and visually appealing, and the majority expressed enthusiasm about "playing the game" again or exploring similar activities in the future. The third module, "A Walk with Mumu," emerged as a particular favorite, cited by all participants as the most enjoyable component of the experience.

Technical Issues and Suggestions

While most technical and usability issues were minimal, their identification at this stage is valuable for informing future development. In terms of technical issues encountered during gameplay, the vast majority (83%) reported that they did not experience any technical problems, while only one child (17%) reported occasional difficulties.

When asked whether they felt unsure about what to do during the game, five participants (83%) indicated that they did not experience uncertainty, whereas one participant (17%) mentioned feeling unsure at times. For example, isolated reports of confusion or technical difficulty underscore the need for clear instructions and robust platform design in subsequent iterations.

Image 7.
Distribution Of Children's Responses to Whether They Would Like to Play the Game Again

Overall, all participants characterized the game as interesting and visually appealing. When asked if they would like to play the game again (Image 7), five children (83%) responded positively, while one child (17%) answered "maybe." Notably, all participants highlighted the third sub-game, "A Walk with Mumu," as the most enjoyable aspect of the experience.

DISCUSSION

This feasibility study sets out to examine whether digital activities that combine gamification and digital storytelling could serve as an engaging and practical tool for the preliminary screening of pragmatic language skills in children. Our findings offer promising indications: the children in our small sample not only enjoyed the game but also

demonstrated a high level of engagement and adaptability, even among those with limited prior experience with digital educational tools.

The enthusiastic reception of the "A Walk with Mumu" digital activity suggests that interactive, dialogue-based activities resonate with young users, potentially increasing their motivation and the authenticity of their responses. These findings align with broader literature on the value of gamification and narrative design in educational contexts (Ancona et al., 2024; Bernardini et al., 2014; Mills et al., 2022; Min et al., 2022; Mojtahedzadeh et al., 2021; Tung et al., 2024; Xu et al., 2023).

Nevertheless, the study also brings to light several important limitations, each of which offers direction for future research and improvement. In detail, the small, non-clinical sample precludes any generalization of results and limits statistical validity. Next, the current iteration focused primarily on usability and engagement, rather than on validating the tool's effectiveness against established pragmatic assessment methods. Subsequently, our evaluation centered on the children's immediate experience, without investigating long-term effects. Further, developing the digital activities in PowerPoint facilitated rapid prototyping in a tool familiar to non-programmers. The activities were developed and tested exclusively in Greek, limiting the applicability to other cultural or linguistic settings. Finally, reliance on self-reported engagement may introduce response bias.

Looking ahead, future research may build on the insights gained from this feasibility study. Larger and more diverse samples, including children with language impairments or neurodevelopmental disorders, can be recruited to better understand the tool's utility across populations. Comparative studies, using both quantitative and qualitative methods, can evaluate the digital activities alongside established pragmatic assessment tools to determine its accuracy and reliability. The digital activities can be redeveloped on an advanced digital platform to enhance interactivity, accessibility, and data management. Furthermore, researchers may also translate and culturally adapt them for broader use. Longitudinal research could assess the long-term impact of repeated use on pragmatic skill development. Moreover, embedding intervention digital activities could extend their function in a systemic personalized approach.

By following these directions, future studies will strengthen the evidence base and expand the tool's value for educators, clinicians, and, most importantly, the children it aims to support. As digital approaches become more integrated into educational and clinical practice, such tools may play a crucial role in early identification and support for children with pragmatic difficulties.

CONCLUSION

This feasibility study demonstrates that combining elements of gamification and digital storytelling may serve as an engaging and practical tool for the preliminary screening of pragmatic language skills in primary school children. The positive responses from participants highlight the promise of interactive, child-centered approaches for early identification of pragmatic deficits. While the small sample and methodological limitations restrict generalizability, these initial results provide valuable guidance for further development and validation. Future research may focus on expanding the sample, comparing the tool with established assessment methods, and enhancing its technological features and cultural adaptability. Ultimately, integrating innovative digital tools into educational and clinical settings may contribute to more effective, inclusive, and motivating pathways for supporting children's communication skills.

GAMIFICATION IN SECONDARY EDUCATION: BENEFITS, IMPLEMENTATION AND CHALLENGES

Chatziantonakis Dimitrios
Secondary Education Teacher, PE 82. Ms, Med.
1st Vocational High School of Nea Ionia, Volos, Greece
e-mail: dxatzh@gmail.com

ABSTRACT

Modern educators constantly seek innovative teaching approaches that enhance the learning process and engage students. One of the most widely adopted techniques is gamification, which incorporates game elements, mechanisms, and characteristics into non-game contexts. Through the use of badges, points, leaderboards, and challenges, gamification aims to increase student participation, boost motivation, and improve interactivity in the educational process. In secondary education, the implementation of gamification can contribute to the creation of a more engaging learning environment, enhancing both student involvement and teaching effectiveness. At the same time, educators tend to have a positive attitude toward its application, recognizing the benefits of its integration.

This study focuses on the applications of gamification in secondary education in Greece, examining both the benefits and challenges associated with its implementation. Initially, a literature review was conducted, analyzing research studies and articles that present gamification applications in secondary education, both in general and special education settings. The findings highlight the advantages and potential of gamification in diverse learning environments, demonstrating its association with increased student engagement, higher learning motivation, and improved interaction between students and teachers.

Subsequently, a quantitative study was conducted through a questionnaire survey involving 45 secondary education teachers from various disciplines in the Magnesia and Larissa regional education departments. The objective of the study was to identify the main challenges that educators face when implementing gamification in their teaching practices. The findings reveal that despite educators' positive attitudes, significant barriers hinder the adoption of gamification. Specifically, the key obstacles identified include the lack of teacher training, insufficient technological infrastructure, large class sizes, and limited instructional time.

The study concludes that the successful integration of gamification in secondary education requires institutional support, an upgrade of school infrastructure, and targeted teacher training. These factors are essential to fully harness the potential of this technique for the benefit of the learning process.

Keywords: Gamification, Secondary Education, Benefits, Challenges, Student Engagement

INTRODUCTION

In recent years, the integration of educational games into teaching practices has become increasingly prominent, as play constitutes a dynamic pedagogical approach that supports students' development on cognitive, emotional, and social levels (Papastergiou, 2009). At the same time, it fosters motivation and facilitates the learning process through engagement and interaction (Plump, 2017). The recognition of these features has led to the systematic development of game-based instructional methodologies, with gamification being the most prominent.

The term "gamification" gained widespread usage in 2010 (Deterding et al., 2011), with its initial applications primarily observed in the economic sector (Dicheva et al., 2015). In the field of education, the term emerged in 2012 and has since attracted steadily increasing research interest (Harman et al., 2014). For a more comprehensive understanding of the concept, it is essential to clarify its definition. Most researchers converge on the following formulation: "The use of game design elements, mechanics, features, and structures in contexts that are not inherently game-related" (Deterding, Dixon, Khaled & Nacke, 2011, p. 10). According to Werbach and Hunter (2012), gamification is based on three fundamental components: dynamics, mechanics, and design elements. Specifically, dynamics refer to the overall context of implementation, mechanics concern the activities carried out, and design elements include rewards, badges, leaderboards, and avatars.

Within the educational process, one of the primary objectives of the educator is the active engagement of students (Lee & Hammer, 2011). Gamification constitutes a pedagogical technique which, according to Dicheva et al. (2015), enhances students' motivation, leading to increased participation in the learning process and greater willingness to act. Moreover, it strengthens interaction, fosters socialization and mutual support (Toba et al., 2018). It also contributes to the development of skills and the cultivation of problem-solving abilities, positively impacting academic performance (Gooch et al., 2016).

According to Dicheva et al. (2015), most studies agree that gamification has a positive effect on the learning process, contributing to the creation of a dynamic and participatory learning environment. Through this approach, students' collaboration, autonomy, and creativity are enhanced. Overall, its implementation can significantly improve the learning experience, making the educational process more effective and engaging.

GAMIFICATION IN SECONDARY EDUCATION: IMPLEMENTATION AND PEDAGOGICAL BENEFITS

Numerous studies support that the implementation of gamification in education leads to positive outcomes. The integration of gamification techniques into the learning process enhances students' active participation, reduces anxiety, fosters a learning environment free of fear of failure, increases interactivity, and approaches knowledge through enjoyment (Katsigiannakis & Karayiannidis, 2015 · Hamari et al., 2014). Additionally, these techniques have been linked to the reduction of school failure, the narrowing of performance gaps among students of differing abilities, and the overall improvement of learning outcomes (Dicheva et al., 2015).

However, despite the many well-documented benefits of gamification, studies focusing on its implementation in secondary education—particularly within the Greek educational system—remain limited. In contrast, gamification is more widely applied in higher education, a trend attributed to the greater specialization of university instructors and their enhanced access to technological resources (Dichev & Dicheva, 2017).

In Greek secondary education, according to findings from the literature review, gamification has been implemented in various subjects such as Informatics, Natural Sciences, History, and Agricultural Studies, with positive effects on both the learning experience and student performance. In the teaching of HTML at a General Lyceum, Mastoras and Fotaris (2015) applied gamification techniques using platforms such as Kahoot and Codecademy, resulting in increased interest and improved student performance compared to traditional teaching methods. Similarly, Angelinas (2022) utilized animation and augmented reality in teaching Ohm's Law to third-grade lower secondary students, incorporating elements such as levels and points. Students demonstrated increased engagement and reduced anxiety regarding failure.

In History, Michala et al. (2018) introduced gamification elements in a teaching scenario focused on Cycladic Civilization during the Bronze Age, with students exhibiting greater enthusiasm, enhanced collaboration, and positive emotional involvement. Stagias (2020) applied gamification techniques in a Vocational Lyceum in the field of Agricultural Studies, reporting high levels of student satisfaction and participation. Additionally, in the subject of Internet Safety,

Torosiadou (2018) implemented gamification in a distance learning course, noting increased student participation and improved performance compared to traditional methods.

Beyond general education, gamification has proven particularly effective in special education, where it is adapted to meet the needs of students with learning difficulties. Lyris (2019) used the Kahoot application with students with special needs in the subject of Health Education in the first and second grades of lower secondary school, recording positive outcomes in terms of satisfaction, motivation, and learning experience. Improvements were also noted in classroom dynamics and a reduction in inappropriate behaviors. Furthermore, Vareli and Skanavi (2019) incorporated gamification elements into customized board games tailored to the educational needs of students in special education during Modern Greek Language lessons. The results indicated improved classroom atmosphere, enhanced interactivity, and increased student self-confidence.

BENEFITS OF GAMIFICATION IN SECONDARY EDUCATION

According to our literature review, the benefits of implementing gamification in secondary education can be categorized as follows—findings that are consistent with international studies (Hamari et al., 2014 · Dicheva et al., 2015):

- **Improved academic performance**: Students who participated in gamified lessons achieved higher scores compared to those taught using traditional methods (Mastoras & Fotaris, 2015 · Torosiadou, 2018).
- **Increased engagement and participation**: The use of interactive tools such as Kahoot and levels created a more engaging learning environment (Angelinas, 2022 · Stagias, 2020).
- **Positive emotional impact**: Gamification reduced students' anxiety related to failure and boosted their self-confidence (Angelinas, 2022 · Michala et al., 2018).
- **Enhanced collaboration**: Students developed better interpersonal relationships and learned through collaborative activities (Michala et al., 2018).
- **Support for students with special needs**: Gamification was adapted to meet the needs of students in special education, improving their learning experience and behavior (Lyris, 2019 · Vareli & Skanavi, 2019).

In conclusion, gamification has been successfully applied across various subjects in secondary education and can be tailored to the specific needs of students in special education. This method enhances academic performance, provides motivation, reduces anxiety, and fosters collaboration. Future research could focus on evaluating the long-term effectiveness of gamification and developing strategies tailored to the demands of diverse learning environments.

RESEARCH QUESTIONS

Based on the theoretical framework, the present study aims to investigate the extent to which secondary education teachers recognize the benefits of gamification, whether they implement it in their teaching practice, and which factors may hinder its adoption. Specifically, the research is guided by the following questions:

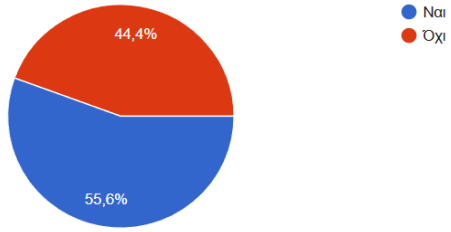
1. What is teachers' attitude toward the implementation of gamification in secondary education?
2. What are the main factors that act as barriers to its implementation?

Thus, the study seeks to highlight both the practical application of gamification and the challenges that educators face in its adoption.

METHODOLOGY, SAMPLE, AND RESEARCH PROFILE

The objective of this study is to explore the obstacles that hinder the implementation of gamification in secondary education in Greece. The research follows a quantitative approach (Cohen & Manion, 1994) and was conducted through the use of a questionnaire, as this method offers advantages such as wide distribution, ease of completion, and the ability to quantitatively analyze the data collected (Cohen et al., 2007).

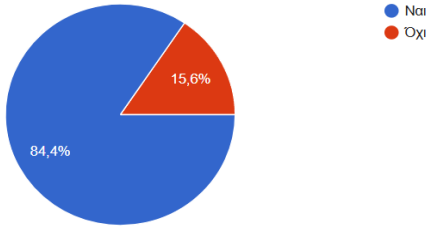
The questionnaire was created using the Google Forms platform and distributed online. A total of 45 secondary education teachers (both permanent and substitute) participated, primarily from Vocational High Schools within the Directorates of Secondary Education of Magnesia and Larissa. For the analysis of the data, modern tools for assisted processing and classification were employed under the supervision of the researchers.



DEMOGRAPHIC ANALYSIS OF PARTICIPANTS

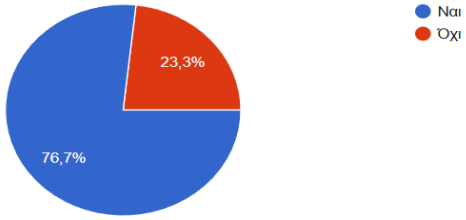
The study involved a total of 45 educators, of whom 25 were female (56.8%) and 19 male (43.2%), while one participant did not respond to the gender-related question. Regarding employment status, 84.1% of the participants were tenured teachers, whereas 15.9% were employed on a temporary basis. In terms of teaching experience, the majority of

participants (18 individuals) reported having over 10 years of professional teaching service.Concerning academic qualifications, 57.8% (26 participants) held a Master's degree, 40% (18 participants) possessed a Bachelor's degree from a university or technical institution, and one participant (2.2%) held a doctoral degree.



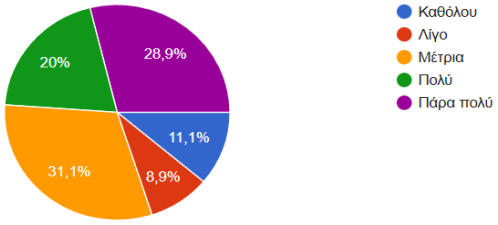
One of the central research questions addressed in this study concerns educators' overall attitudes toward the implementation of gamification. In response to the question: *"Have you ever implemented gamification in your educational practice at least once?"* (Figure 1), 55.6% of the respondents (25 educators) answered affirmatively, whereas 44.4% (20 educators) reported they had never applied gamification in their teaching process.

Figure 1
Have you ever implemented gamification in your educational practice at least once?



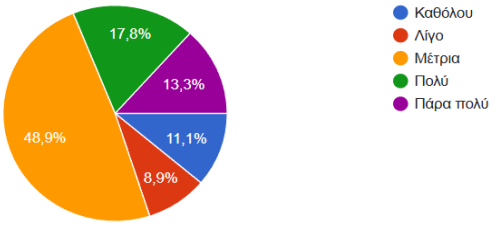
Regarding educators' perceptions of the applicability of gamification in secondary education (Figure 2), the majority of respondents (84.4%) expressed a positive view, while 15.6% believed it is not practically feasible.

Figure 2
Do you believe that gamification can be applied in secondary education?



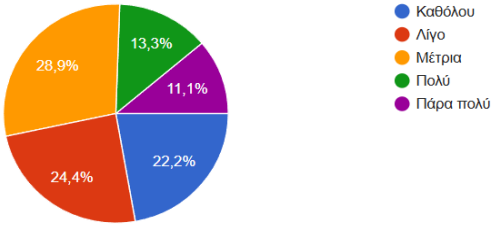
Among those educators who have already incorporated gamification into their teaching practices (Figure 3), the majority (76.7%) reported positive outcomes from its implementation, while 23.3% indicated that they did not observe any significant benefits.

Figure 3
Following the implementation of gamification, did it yield positive outcomes?



A central issue addressed by the research concerns the investigation of obstacles hindering the integration of gamification into educational practice. In response to the question regarding the legal framework as a potential barrier (Figure 4), 28.9% of educators considered it a "very high" barrier, 20% evaluated it as a "high" barrier, 31.1% rated it as "moderate," 8.9% as "low," while 11.1% stated that it does not constitute a barrier at all.

Figure 4
To what extent is the current legal framework considered an obstacle to the implementation of gamification?



As for the curriculum guidelines acting as a restrictive factor in applying gamification (Figure 5), 13.3% of participants identified them as a "very high" barrier, 17.8% as a "high" barrier, and 48.9% assessed them as a "moderate" obstacle. Meanwhile, 8.9% considered them a "low" barrier, and 11.1% indicated that they pose no obstacle.

Figure 5
To what extent are curriculum guidelines considered a barrier to the implementation of gamification?

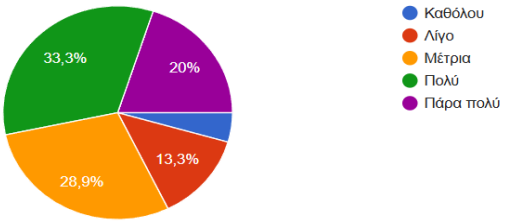
In response to the question examining whether the nature of the subjects (theoretical or practical) affects the implementation of gamification (Figure 6), 11.1% of participants perceived it as a "very high" barrier, and 13.3% as a "high" one. Furthermore, 28.9% rated it as "moderate," 24.4% as "low," and 22.2% believed it does not constitute a barrier.

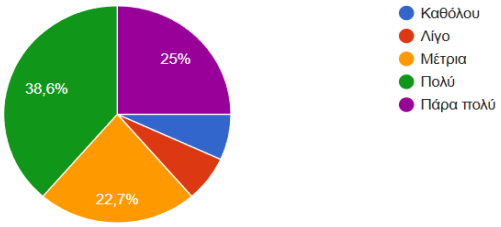
Figure 6
To what extent is the nature of the subjects (theoretical/practical) considered a barrier to the implementation of gamification?

Effective time management in teaching is, in itself, a significant challenge. When asked whether the available instructional time acts as a barrier to the application of gamification (Figure 7), 20% of respondents described it as a "very high" barrier, 33.3% as "high," and 28.9% as "moderate." In contrast, 13.3% evaluated it as a "low" barrier, and 4.4% stated that it does not constitute an obstacle.

A further limiting factor is the potential lack of technological infrastructure (Figure 8). Specifically, 25% of educators identified it as a “very high” barrier, 38.6% characterized it as “high,” while 22.7% evaluated it as a “moderate” obstacle. In addition, 6.8% considered it a “low” barrier, and another 6.8% stated that it does not constitute a barrier.

Figure 7
To what extent is the available instructional time considered a barrier to the implementation of gamification?





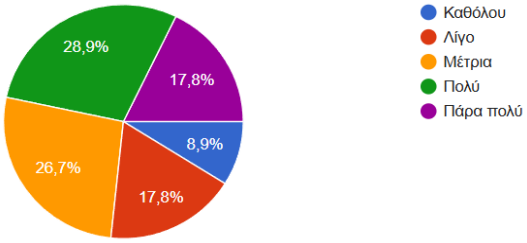


Figure 8
To what extent is the potential lack of technological infrastructure considered an obstacle to the implementation of gamification?

Regarding whether technical issues and internet connectivity hinder the application of gamification (Figure 9), 17.8% of respondents perceived them as a "very high" barrier, 28.9% evaluated them as "high," and 26.7% rated them as "moderate." Moreover, 17.8% classified them as a "low" barrier, while 8.9% stated that they do not constitute an obstacle.

Figure 9
To what extent are technical issues considered an obstacle to the implementation of gamification?

In response to whether class size affects the implementation of gamification (Figure 10), 22.7% of educators viewed it as a "very high" barrier, 38.6% as "high," and 27.3% as a "moderate" obstacle. Conversely, 4.5% considered it a "low" barrier and 6.8% stated that it does not pose an obstacle.

The lack of student familiarity with gamification may also act as a deterrent to its implementation. In this regard (Figure 11), 11.1% of educators identified it as a "very high" barrier, 20% as "high," and 31.1% as a "moderate" obstacle. Additionally, 24.4% considered it a "low" barrier, while 13.3% stated that it does not constitute an obstacle.

Another factor investigated was the lack of incentives for educators. In response to the question *"To what extent do you consider the lack of incentives for teachers to be an obstacle to the implementation of gamification?"* (Figure 12), 13.3% of participants evaluated it as a "very high" barrier, 35.6% as "high," and 33.3% as a "moderate" obstacle. Respectively, 11.1% and 6.7% regarded it as a "low" or "non-existent" obstacle.

Figure 10
To what extent is class size considered an obstacle to the implementation of gamification?

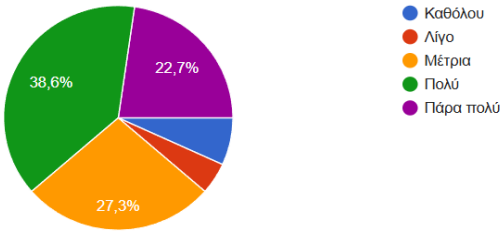

Figure 11
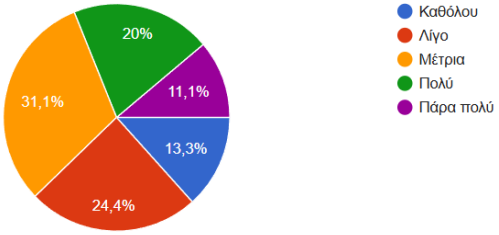
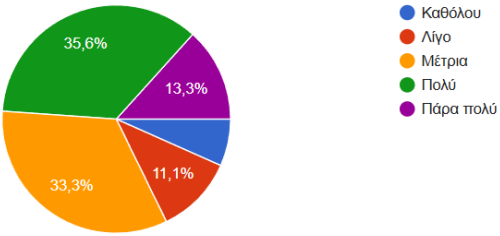
To what extent is the lack of student familiarity with gamification considered a barrier to its implementation?





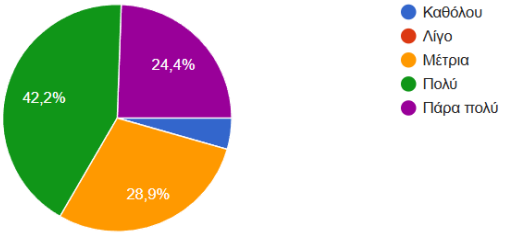


Figure 12
To what extent is the lack of incentives for teachers considered a barrier to the implementation of gamification?

Finally, the study explored the extent to which the lack of teacher training acts as a barrier to the implementation of gamification (Figure 13). Specifically, 24.4% of educators identified it as a "very high" obstacle, and a substantial 42.2% considered it a "high" barrier. Moreover, 28.9% rated it as "moderate," 4.4% as "low," and 2.2% reported that it is not an obstacle.

To what extent is the lack of teacher training considered a barrier to the implementation of gamification?

DISCUSSION OF FINDINGS

This study examined the attitudes of secondary education teachers regarding the implementation of gamification, as well as the barriers that hinder its use. According to the findings, 84.8% of participants expressed a positive attitude toward the application of gamification in secondary education, which is consistent with previous international research (Li et al., 2022; Martí-Parreño et al., 2016). However, this positive attitude is not fully reflected in actual teaching practice, as only 55.6% of respondents reported having implemented gamification at least once in their instructional process. This discrepancy between theoretical acceptance and practical application has also been observed in the study by Martí-Parreño et al. (2016), where a similar divergence was noted. This gap may be attributed to factors such as lack of teacher training, insufficient infrastructure, and constraints related to available instructional time—barriers that were also identified in the present research and will be analyzed in the following sections.

Figure 14
Inhibiting factors for the implementation of gamification

According to the data analysis, the most significant barrier identified was the lack of teacher training, reported by 66.6% of participants. This factor acts as a major deterrent to the adoption of gamification in educational settings. This finding aligns with previous studies (Mee Mee et al., 2020 · Pasia, 2023 · Simitsi, 2024), which also highlighted that the absence of professional development and, consequently, the lack of relevant knowledge, hinders the integration of gamification. The limited familiarity of educators with the principles of gamification, combined with a lack of experience in applying it, has been broadly recognized as a key challenge to its effective use in instructional practice (Araújo & Carvalho, 2017· Sánchez Mena & Martí-Parreño, 2017).

Educators also identified the lack of technological infrastructure as one of the most important obstacles to implementing gamification, with 63.6% of respondents rating it as either a “very high” or “high” barrier. The inadequacy or obsolescence of equipment has been similarly reported in earlier studies as a hindrance to the integration of innovative teaching approaches, including gamification, in Greek schools (Tziafetas et al., 2013 · Foutsitzi & Caridakis, 2021).

Another significant barrier identified was class size, with 61.3% of teachers viewing it as a “very high” or “high” barrier. Large class sizes hinder the ability to personalize instruction and adapt gamified activities to individual student needs. Moreover, managing a large group requires additional time and resources, which may discourage teachers from adopting new methodologies such as gamification. Although there are no specific studies directly linking class size to gamification implementation, it is widely accepted within the educational community that smaller class sizes facilitate the application of innovative teaching practices.

Time management remains a major challenge for educators. Gamification often requires more extensive preparation compared to traditional teaching methods (Vasilakopoulou, 2018). In addition to preparation, our findings indicate that 53.3% of educators perceive the available instructional time as insufficient for implementing gamification. The issue of limited time has also been cited in previous studies as one of the main factors that either hinders or, in some cases, renders the application of games in teaching unfeasible (Becker, 2007 · Becker & Jacobsen, 2005 · Macedonia, 2005 · Stojković & Jerotijević, 2011).

The above-mentioned barriers emerged as the most critical for the effective use of gamification. However, other factors were also evaluated—primarily as “moderate” obstacles—such as curriculum guidelines (48.9%), the nature of the subjects (28.9%), technical issues (26.7%), and students’ unfamiliarity with gamification (31.1%). These findings suggest that, although these elements may influence the application of gamification, they are not regarded by the majority of educators as prohibitive.

CONCLUSIONS

Gamification represents an innovative instructional approach that can be applied across all educational levels, enhancing the learning process through increased engagement, collaboration, and interactivity. In secondary education, its implementation has proven particularly effective in both general and special education settings, contributing to improved academic performance and heightened emotional involvement among students.Despite its documented benefits, studies focusing on the implementation of gamification in Greek secondary education remain limited. This highlights the need for further research aimed at exploring its feasibility and effectiveness within the Greek educational context. While educators recognize the value of gamification and maintain a generally positive attitude toward this technique, its practical application remains constrained due to several inhibiting factors, such as insufficient teacher training, inadequate technological infrastructure, large class sizes, and limited instructional time. The successful integration of gamification into the educational process requires institutional support, an upgrade of school facilities, and targeted professional development for secondary school educators . These measures are essential to ensure its sustainable and effective implementation.Finally, future research should focus on evaluating the long-term effectiveness of gamification and developing strategies that facilitate its adaptation across diverse learning environments.

ABSTRACT

The integration of virtual laboratories (VLs) into secondary STEM (Science, Technology, Engineering, and Mathematics) education is transforming traditional teaching practices by providing interactive, cost-effective, and flexible learning environments. This study investigates the instructional approaches, benefits, challenges, and prospects of VLs in enhancing scientific learning. VLs simulate real lab environments, enabling students to conduct experiments digitally, manipulate variables, and visualize complex phenomena—promoting engagement, motivation, and inquiry-based learning. Despite their advantages, limitations such as the lack of tactile experience, the need for teacher training, curriculum alignment, and digital access disparities remain significant. A blended learning approach combining physical and virtual labs is recommended to ensure comprehensive skill development. With emerging technologies like AI, augmented reality, and collaborative platforms, the future of VLs in secondary STEM education appears promising. Overall, VLs have the potential to play a critical role in preparing students for higher STEM education by fostering conceptual understanding and essential 21st-century skills.

Keywords: Virtual laboratories, Secondary education, STEM

INTRODUCTION

Laboratory experiments have long been considered a core component of science education, providing students with the opportunity to manipulate scientific equipment, observe phenomena, and construct conceptual understanding. Through physical interaction, learners are expected to develop deeper interest in science, enhanced understanding of principles, and improved retention of knowledge (Sypsas and Kalles, 2018). Additionally, laboratory instruction plays a crucial role in many STEM (Science, Technology, Engineering, and Mathematics) courses by enabling the practical application of theoretical knowledge through hands-on experimentation (Rahmadani et al., 2023). It offers numerous educational benefits, allowing students to engage actively in the learning process and develop their problem-solving and critical thinking abilities through inquiry-based methods. However, studies have revealed that traditional laboratory instruction often fails to achieve its educational goals (Lunetta et al., 2007). Students may follow procedures mechanically without engaging in authentic scientific inquiry, leading to superficial learning or rote memorization of textbook content. To address this, science education has increasingly turned toward inquiry-based approaches that emphasize exploration, hypothesis formulation, experimentation, and reflection (Paxinou et al., 2018).

Grounded in constructivist theory, inquiry-based learning encourages students to actively investigate scientific phenomena, build hypotheses, conduct tests, and draw conclusions. Yet, implementing inquiry-based instruction in physical labs presents significant challenges, including logistical limitations, classroom management issues, and lack of instructional support (Sypsas et al., 2019; Olympiou et al., 2013). Recent technological advancements have introduced virtual laboratories (VLs) as an innovative alternative or complement to physical labs (Parastatidis et al., 2022). VLs are technology-driven environments that simulate real laboratory settings in either two or three dimensions (Reeves et al., 2021). They immerse learners in interactive simulations where they can operate virtual equipment and handle digital materials using a keyboard, mouse, or handheld controllers (Andersen et al., 2023). VLs allow students to access simulated experimental environments via computers or VR headsets, overcoming constraints of time, space, safety, and cost. These platforms can provide structured guidance, real-time feedback, and increased visibility of complex or invisible scientific processes. A growing body of research supports the effectiveness of VLs in enhancing student engagement, motivation, procedural knowledge, and conceptual understanding (Sypsas et al., 2025). Particularly in the context of immersive virtual reality (VR), learners report increased presence and emotional involvement. However, questions remain about how to integrate VR-based labs effectively within traditional classroom settings and how varying degrees of immersion affect learning outcomes (Makransky et al., 2019).

This paper explores the pedagogical integration of virtual laboratories in secondary STEM education. It examines the theoretical foundations, instructional benefits, challenges to implementation, and prospects of VLs, with particular focus on inquiry-based learning models and immersive VR technologies.

ADVANTAGES AND CHALLENGES OF VIRTUAL LABS

Laboratory Learning in STEM Education

Laboratory activities play a pivotal role in STEM education, particularly in science disciplines, by offering learners hands-on experiences that bridge theoretical knowledge with real-world phenomena. Traditionally, labs are designed to help students develop experimental skills, foster scientific thinking, and validate theoretical principles through observation and manipulation of physical materials.

Virtual Laboratories: Definitions and Modalities

Virtual laboratories (VLs) are computer-based environments that simulate real-life laboratory conditions, enabling learners to conduct experiments in a digital space. VLs can be broadly categorized based on the level of immersion they offer (Jensen and Konradsen, 2018; Makransky et al., 2019; Potkonjak et al., 2016; Sypsas and Kalles, 2017):

- **Desktop Virtual Labs**: These are accessed through a standard computer interface (monitor, mouse, keyboard) and are widely used due to their ease of access and low cost. They support interactive experiments with guided tasks, simulations, and embedded assessments.
- **Immersive Virtual Reality Labs (HMD VR)**: These utilize head-mounted displays and motion controllers to provide a fully immersive 3D experience. Immersive VR enhances the learner's sense of presence, enabling a more realistic and embodied interaction with the virtual environment.

VLs are particularly valuable in contexts where physical laboratories are unavailable, unsafe, or limited by budgetary or logistical constraints. They offer flexibility, repeatability, and customizable feedback, aligning well with

inquiry-based learning objectives. Furthermore, VLs allow students to visualize abstract or invisible phenomena—such as electric currents or molecular interactions—that are often difficult to observe in traditional labs (Sypsas and Kalles, 2018). For instance, Onlabs, a 3D virtual reality biology laboratory developed by the Hellenic Open University, exemplifies how technology can be used to simulate lab environments for learners across various academic levels, enhancing accessibility and motivation (Zafeiropoulos and Kalles, 2016).

In summary, virtual laboratories serve as both a pedagogical and technological innovation in STEM education. When combined with inquiry-based methodologies, they have the potential to enrich student learning by fostering engagement, curiosity, and scientific literacy.

Pedagogical Advantages

Virtual laboratories (VLs) offer numerous benefits that enhance the quality and accessibility of STEM education. One of their most significant strengths is the ability to engage students in interactive and inquiry-driven learning without the constraints of physical resources or safety concerns. Students can manipulate variables, repeat experiments multiple times, and explore scientific phenomena at their own pace, thus supporting differentiated instruction and personalized learning paths (Paxinou et al., 2020a). Moreover, VLs facilitate visualization of complex or abstract scientific concepts (e.g., electron flow, molecular structures), which are often invisible or difficult to observe in traditional settings. These visual and interactive elements promote deeper conceptual understanding and long-term retention (Lai et al., 2022; Sypsas and Kalles, 2018). In immersive environments, students can experience a heightened sense of presence, which has been linked to increased engagement and motivation (Andersen et al., 2023; Makransky et al., 2019).

Gamification features, such as missions, real-time feedback, and adaptive difficulty levels, further enhance learner motivation (Bonde et al., 2014). For instance, in the SIVRLAB study, students were tasked with rescuing a robot by constructing a galvanic cell, thereby embedding scientific inquiry into a narrative structure that fostered purposeful learning (Lai et al., 2021).

Finally, VLs are cost-effective and scalable, providing access to high-quality experimental activities in schools that may lack physical labs, specialized equipment, or trained technical staff (Paxinou et al., 2018).

Inquiry-Based Learning and Constructivism

Inquiry-based learning (IBL) is rooted in constructivist educational theory, which posits that learners actively construct knowledge through meaningful experiences. IBL places students at the center of the learning process, guiding them to pose questions, investigate phenomena, collect and analyze data, and derive conclusions (National Research Council, 2000; de Jong, 2019). This method contrasts with didactic instruction, as it requires students to assume responsibility for their learning and develop skills such as scientific reasoning, problem-solving, and hypothesis testing (Sypsas et al., 2019). Nevertheless, implementing IBL in traditional classroom settings is not without challenges. Educators may struggle with time constraints, lack of resources, and difficulty providing sufficient scaffolding during open-ended tasks (Lai et al., 2021).

Implementation Challenges

Despite their benefits, virtual laboratories are not without limitations. A primary concern is the absence of tactile, hands-on experiences, which are essential for developing procedural skills and kinesthetic awareness. While VLs simulate experimental processes, they may not fully replicate the fine motor tasks or haptic feedback involved in handling real lab equipment (Potkonjak et al., 2016). This gap can lead to incomplete skill development if VLs are used in isolation. To address this, many scholars recommend a blended approach that combines virtual and physical labs, ensuring that students benefit from both cognitive modeling and real-world manipulation (de Jong, Linn, & Zacharia, 2013).

Another challenge is the need for teacher training. Effective implementation of VLs requires educators to be proficient not only in using the digital tools but also in designing inquiry-based learning scenarios and integrating VLs into the existing curriculum. Without proper training and support, teachers may revert to procedural instruction, undermining the exploratory nature of virtual labs (Sypsas et al., 2025).

Lastly, digital equity remains a pressing concern. Access to reliable hardware, internet connectivity, and technical support varies widely across schools and regions. Ensuring equitable access to high-quality digital labs is critical to preventing the deepening of educational inequalities.

APPLICATIONS AND CASE STUDIES
